KEY TO PRONUNCIATION.

a	as in ale, fate. Also see <i>ě</i> , below.	D	as in the Spanish Almodovar, pulgada, where it is nearly like <i>th</i> in English then, this.
" "	senate, chaotic. Also see <i>ě</i> , below.	g	" " go, get.
" "	glare, care.	G	" " the German Landtag, and <i>ch</i> in Feuerbach, buch; where it is a guttural sound made with the back part of the tongue raised toward the soft palate, as in the sound made in clearing the throat.
" "	ann, at.	H	" " <i>j</i> in the Spanish Dijona, <i>g</i> in the Spanish gila; where it is a fricative somewhat resembling the sound of <i>h</i> in English hue or <i>y</i> in yet, but stronger.
" "	arm, father.	hw	" " <i>wh</i> in which.
" "	ant, and final <i>a</i> in America, armada, etc. In rapid speech this vowel readily becomes more or less obscured and like the neutral vowel or a short <i>u</i> (<i>ū</i>).	K	" " <i>ch</i> in the German ieh, Albrecht, and <i>g</i> in the German Arensburg, Mecklenburg; where it is a fricative sound made between the tongue and the hard palate toward which the tongue is raised. It resembles the sound of <i>h</i> in hue, or <i>y</i> in yet; or the sound made by beginning to pronounce a <i>k</i> , but not completing the stoppage of the breath. The character <i>k</i> is also used to indicate the rough aspirates or fricatives of some of the Oriental languages, as of <i>kh</i> in the word Khan.
a	" " final, regal, where it is of a neutral or obscure quality.	n	" " sinker, longer.
" "	all, fall.	ng	" " sing, long.
" "	eye.	N	" " the French bon, Bourbon, and <i>m</i> in the French Etampes; where it is equivalent to a nasalizing of the preceding vowel. This effect is approximately produced by attempting to pronounce 'onion' without touching the tip of the tongue to the roof of the mouth. The corresponding nasal of Portuguese is also indicated by <i>x</i> , as in the case of São Antão.
" "	elate, evade.	sh	" " shine, shut.
" "	end, pet. The characters <i>č</i> , <i>ā</i> , and <i>ā</i> are used for <i>ā</i> in German, as in Gärtner, Gräfe, Hühnel, to the values of which they are the nearest English vowel sounds. The sound of Swedish <i>a</i> is also indicated by <i>č</i> .	th	" " thrust, thin.
" "	ern, her, and as <i>i</i> in sir. Also for <i>ö</i> , <i>œ</i> , in German, as in Göthe, Goethe, Ortel, Oertel, and for <i>eu</i> and <i>œu</i> in French, as in Neufchâtel, Crèvecoeur; to which it is the nearest English vowel sound.	TH	" " then, this.
" "	agency, judgment, where it is of a neutral or obscure quality.	zh	" " <i>z</i> in azure, and <i>s</i> in pleasure.
" "	ice, quiet.		An apostrophe, or superior comma, ['] is sometimes used to denote a glide or neutral connecting vowel, as in tā'b'l (table), káz'm (chasin).
" "	quiescent.		Otherwise than as noted above, the letters used in the respellings for pronunciation are to receive their ordinary English sounds.
" "	ill, fit.		When the pronunciation is sufficiently shown by indicating the accented syllables, this is done without respelling; as in the case of very common English words, and words which are so spelled as to insure their correct pronunciation if they are correctly accented. See the article on PRONUNCIATION.
" "	old, sober.		
" "	obey, sobriety.		
" "	orb, nor.		
" "	odd, forest, not.		
" "	atom, carol, where it has a neutral or obscure quality.		
oi	" " oil, boil, and for <i>eu</i> in German, as in Feuerbach.		
oo	" " food, fool, and as <i>u</i> in rude, rule.		
ou	" " house, mouse.		
ū	" " use, mule.		
ū	" " unite.		
ū	" " cut, but.		
u	" " full, put, or as <i>oo</i> in foot, book. Also for <i>ū</i> in German, as in München, Müller, and <i>u</i> in French, as in Buchez, Budé; to which it is the nearest English vowel sound.		
û	" " urn, burn.		
y	" " yet, yield.		
B	" " the Spanish Habana, Cordoba, where it is like a <i>v</i> made with the lips alone, instead of with the teeth and lips.		
ch	" " chair, cheese.

THE NEW INTERNATIONAL ENCYCLOPÆDIA.

REIFFERSCHIED, rîffer-shît, AUGUST (1835-87). A German archaeologist and classical philologist, born and educated in Bonn. He received a traveling fellowship in archaeology from the University of Bonn; spent 1861-66 mostly in Italy, being part of the time charged by the Vienna Academy to make archival research for the *Corpus Scriptorum Ecclesiasticorum Latinorum*; and was professor at Breslau (1868-85), and from 1885 at Strassburg. His works include *Suetoni prater Cesarum Libros Reliquiae* (1860), the standard edition of these fragments; *Bibliotheca Patrum Latinorum Italica* (1865-72); *Arnobius* (1875); an edition of Anna Commena's *Alexias* (1878); and a partial edition of Tertullian (edited by Wissowa, 1890).

REIGATE, ri'get. A municipal borough and market town in Surrey, England, at the base of the North Downs, 23 miles south of London (Map: England, F 5). The town was incorporated in 1863; it owns a sewage farm, provides isolation for infectious diseases, and contributes to technical instruction. From early times it was considered a place of strength; and after the Conquest it was granted to the earls of Warrenne. The parish church is in various styles of architecture, the oldest portions dating from the twelfth century. Trade is chiefly agricultural. Nearby are quarries of freestone and hearthstone and supplies of fuller's earth, and of silver sand for manufacturing glass. Population, in 1891, 22,646; in 1901, 25,993.

REIG'HARD, JACOB ELLSWORTH (1861—). An American zoölogist, born at Laporte, Ind. He graduated at the University of Michigan in 1882, studied at Harvard and Freiburg, and after six years as instructor and assistant in zoölogy became in 1892 professor in the University of Michigan. He was in charge of the Michigan Fish Commission in 1890-94, and in 1898 was appointed director of the biological survey of the Great Lakes under the United States Fish Commission. He contributed to many technical journals, and in 1901 published in collaboration with Jennings *The Anatomy of the Cat*.

REIGN OF TERROR. That period of the French Revolution beginning with the fall of the Girondists (q.v.) in June, 1793, and terminating with the overthrow of Robespierre (q.v.), July 27, 1794. See FRENCH REVOLUTION.

REIMARUS, ri-mä'rus, HERMANN SAMUEL (1694-1768). A German naturalistic philosopher. He was born in Hamburg, December 22, 1694, studied at the universities of Jena and Wittenberg, traveled afterwards in Holland and England, and on his return was elected rector at Wismar (1723) and in 1728 professor of Hebrew and mathematics at the Gymnasium of Hamburg. He died there March 1, 1768. He is the author of the so-called *Wolfenbüttelsche Fragmente eines Unbekannten*, first published by Lessing in his *Beiträge zur Geschichte und Litteratur aus den Schätzen der Wolfenbüttelschen Bibliothek* (1774, 1777-78). These *Fragmente*, up to that time known only in manuscript by a few of Reimarus's most intimate friends, produced a sensation throughout Germany, since the author, in the boldest and most trenchant manner, denied the supernatural origin of Christianity. They were partially translated, as *Fragments from Reimarus* (London, 1879). A cognate work is his *Vornehmste Wahrheiten der natürlichen Religion* (1754). His edition of Dio Cassius is one of the most valuable contributions to classical philology (1750). Consult his biography by Strauss (Bonn, 1862; 2d ed. 1877).

REIMS, rôms, *Pr. pron.* rãns. A city of France. See RHEIMS.

REIN, rin, JOHANNES JUSTUS (1835—). A German geographer, born at Rannheim-on-the-Main, and educated in mathematics and science at the University of Giessen. He made various scientific journeys in Europe, Asia, and America, and was appointed professor of geography at the University of Marburg in 1876, and subsequently at Bonn. His publications include *Japan, nach Reisen und Studien* (1881-86), which was translated into English, under the title, *Japan, Travels and Researches* (1884), as was also his book on Japanese industries (1889); and *Columbus und seine vier Reisen nach Westen* (1892).

REIN, WILHELM (1847—). A German educator and author, born at Eisenach. He studied at Heidelberg, Leipzig, and Jena, for several years was teacher at Weimar, and from 1876 to 1886 was principal of a school in Eisenach. In 1886 he was appointed professor of pedagogy at the University of Jena. Rein's system of education resembles Herbart's. He ranks among the foremost of educational theorists, and has exerted great influence on the educational institutions of his country. His principal works are *Theorie und Praxis des Volksschulunterrichts* (1879-93) and *Pädagogik im Grundriss* (1892). He edited Niemeyer's *Grundsatz der Erziehung* (1878-79), and founded the educational journal *Pädagogische Studien* in 1880.

REINACH, RICHARD, JOSEPH (1856—). A French publicist, born in Paris. He studied at the Lycée Condorcet and in the faculty of law of the University of Paris, was admitted to the bar in 1877, wrote for the *Démocratie Sociale* and Gambetta's *Republique Française*, and in 1881-82 was private secretary to Gambetta, then president of the Cabinet council. Having reëntered journalism, in 1886 he became proprietor with Deynousse of the *Republique Française*, in which he supported the Union-Republican group. In 1889 he was elected as Liberal-Republican Deputy for Digne (Basses-Alpes), in 1893 was re-elected, but in 1898 failed of reelection because of opposition to his attitude in the Dreyfus case. In the Chamber of Deputies he was a member of the committees on the budget and on the army, and took a prominent part in the legislative debates. He became departmental councillor of Basses-Alpes for the Canton of Montiers in 1896. He appeared prominently in connection with the Dreyfus case, denounced the introduction of secret documents into the trial of 1894, the forgeries of Paty du Clam and Henry, and the complicity of the latter with Esterházy, and was associated with Scheurer-Kestner in the movement for revision. He published on the case several pamphlets, including *La voie de l'île* (1898), *Les enseignements de l'histoire* (1898), *A l'île du diable* (1898), *Vers la justice par la vérité* (1898), *Le crépuscule des traités* (1899), and *Les faits nouveaux* (1899), and the volumes *Les bleds d'hiver* (1901), *Histoire de l'affaire Dreyfus. Le procès de 1894* (1901), and *Histoire de l'affaire Dreyfus. Esterházy* (1903). The brochure *Les enseignements de l'histoire* originally appeared in the *Siech*, and caused Reinach to be expelled from his captaincy in the territorial army for "a gross offense against discipline" and to be deprived of the decoration of the Legion of Honor. Among his further publications are: *La Serbie et le Monténégro* (1876); *Voyage en Orient* (1879); *Le ministère Gambetta* (1884); *Études de littérature et d'histoire* (1888-89); and *Les petites Catalinaires* (1888-89), collected articles against Boulanger. He also edited the *Discours et plaidoyers politiques de Gambetta* (11 vols., 1881-85), and *Dépêches, circulaires, décrets, proclamations et discours de Gambetta* (1886).

REINACH, SALOMON (1858—). A French archaeologist, brother of the preceding, born at Saint-Germain-en-Laye (Seine-et-Oise). He studied at the Lycée Fontanes and the Ecole Normale Supérieure, was appointed to the French Classical School of Athens (Ecole Française d'Athènes), and made interesting excavation and discoveries

at Myrina, near Smyrna, and elsewhere (1880-82). In 1886 he became attaché in the Museum of National Antiquities at St. Germain-en-Laye, in 1890-92 held the chair of assistant professor of national archaeology at the Ecole du Louvre, and in 1893 was appointed associate curator of the National Museums. He was elected to the Académie des Inscriptions et Belles-Lettres in 1896. He reviewed works on archaeology for the *Revue Critique*, edited a careful text (1877) of Saint Augustine's *De Civitate Dei*, and published among his original volumes a *Chronique d'Orient* (1885-91), cataloguing all discoveries made in Greece to that date; *La nécropole de Myrina* (with Pottier, 1887); *Description raisonnée du musée de Saint-Germain* (1890); *Les Coltes dans les vallées du Pô et du Danube* (1894); *Répertoire de la statuaire grecque et romaine* (1897-98); and *Guide illustré du musée national de Saint-Germain* (1899).

REINAUD, RICHARD, JOSEPH TOUSSAINT (1795-1867). A French Orientalist, born at Lambese (Bouches-du-Rhône). He was a pupil of Sylvestre de Sacy, became connected with the Royal Library, and was appointed conservator of that institution in 1834. He was also president and (1838 et seq.) De Sacy's successor as professor of Arabic at the Ecole des Langues Orientales Vivantes (1838-67). He published: *Monuments arabes, persans, et turcs du cabinet de M. le duc de Blacas et d'autres cabinets* (1828), a work of great value, especially in the province of epigraphy; a version of Raymond Lully's *Livre de la loi au Sarrazin* (1831, with Michel); *Extraits des historiens arabes relatifs aux guerres des croisés* (1829); *Invasions des Sarrazins en France* (1836); the text and a French version of Abulfeda's geography (with Slane, 1840-48); *Fragments arabes et persans relatifs à l'Inde* (1834); *Relation des voyages faits par les Arabes et les Persans dans l'Inde et la Chine* (1845); and *Relations politiques et commerciales de l'empire romain avec l'Asie orientale* (1863). From 1817 to his death he was president of the Société Asiatique.

REINDEER (Aeol. *hrcinn*, AS. *hrán*, reindeer, from Lapp *reino*, pasturage + *deer*, AS. *deor*, Goth. *dius*, wild beast, animal, Ger. *Thier*, animal). An Arctic deer (*Rangifer tarandus*) which has long been domesticated and used as a draught animal and a beast of burden in Northern Europe. The wild race still exists in varying abundance almost everywhere from Northern Scandinavia to Eastern Siberia, wandering to the Arctic coast and throughout Spitzbergen, Nova Zembla, and the Phipps and Parry islands. They are not known much south of Lapland in the west, nor below the northern margin of the great forest region in Siberia, but in the Ural region they wander southward to the borders of Perm. Whether the caribou (q.v.) of Greenland and Canada are to be regarded as merely geographical races of the European form, thus considered as a circumpolar species, is a matter of opinion. European zoölogists generally do so regard it, and assert that the differences between European and American examples are not sufficient to be deemed specific. Merriam and other recent American zoölogists think otherwise and set apart no less than six 'species' in the New World. Within historic times reindeer lived in the islands north of Scotland, but became extinct there before the

twelfth century; they were much more recently numerous throughout Scandinavia. The habits of the American species are outlined under CARIBOU. Those of the plains and islands of subarctic Europe and Asia wander about the tundras and desolate treeless mountains, making periodical migrations from one feeding ground to another. In early summer the Spitzbergen herds betake themselves to the grassy valleys of the interior, whence they return in the autumn to the coast to feed upon seaweed. The coming of the winter ice cuts off this resource, compelling them to go into the mountains, where they subsist upon the rock-lichens, which they uncover by shoveling away several feet of snow with their flat horns, or pawing it aside with their feet. The alternate thawing and freezing of spring, by forming a hard crust on the snow, interferes sadly with their welfare, and great numbers sometimes starve at this season. In Siberia, as in North America, migrations in scattered herds regularly take place from the barren coast plains southward to the less inclement region along the borders of the forest area, where food may be obtained. Not much is known of the breeding habits of the wild reindeer except that the fawns are born in the spring.

The reindeer has long been domesticated among the Laplanders and the tribes along the coast of Siberia, and used for drawing sledges and as a riding and burden animal, besides furnishing skins for tents, clothing and harness, flesh and milk for food, and horns and hoofs for various utilities. It has remarkable endurance, strength, and speed in drawing sledges, and without this animal much of Lapland and Siberia could not be permanently inhabited. These qualities led the Government of the United States to endeavor to naturalize reindeer among the Eskimos of the north coast of Alaska, who were in danger of starving through the loss of food and uneconomical habits, following the pursuit of excessive whaling and walrus-hunting by white men off that coast. The experiment was conducted under the direction of the Commissioner of Education and the personal care of the Rev. Sheldon Jackson. Agents procured a small herd of Siberian reindeer which, with Lapp attendants, were landed in Northern Alaska in 1889. The training of Alaskan attendants and drivers was begun, and more herds were annually imported. Up to 1898 550 deer had been brought from Siberia, and the stock with its increase amounted to about 5000 in 1903. Several stations were established where the deer were bred, and where Eskimos were trained in their care and use. The history of the attempt is contained in Jackson's *Annual Reports* to the Department of the Interior, from 1890 onward.

The wild reindeer is much larger than the domesticated races. It is as large as the stag, but heavier and more clumsy in appearance. It has a dark coat in summer and a lighter one in winter, with a growth of long whitish hair under the neck, while the region about the short goat-like tail and the outlines of the hoofs are nearly white. It constitutes a genus (*Rangifer*), differing from that of ordinary deer in the important particular that both sexes have horns, although those of the bucks are larger. These antlers are peculiar in their long, slender, unequally branching beams, and especially in the fact that the brow-tines are greatly produced and palmated, and one is usually aborted to allow the other to

push forward into a formidable weapon, overhanging the face.

During Pleistocene time the reindeer was more widely distributed over Europe than it is at the present day, for its fossil remains have been found as far as the Alps and the Pyrenees.

Consult: Eydekker, *Deer of All Lands* (London, 1898); id., *Royal Natural History*, vol. ii. (London, 1896); Nordenskiöld, *Voyage of the Vega* (New York, 1881); Boyd Dawkins, *Cave Life* (London, 1875); and the works of travelers and explorers in the Arctic regions and the countries where reindeer are used. For the American forms, consult: Stone and Cram, *American Animals* (New York, 1902); Roosevelt, *The Deer Family* (ib., 1902); Preble, "Biological Investigation of the Hudson Bay Region," in *North American Fauna No. 22* (Department of Agriculture, Washington, 1902); and books cited under DEER.

REINDEER MOSS (*Cladonia rangiferina*). A lichen of great importance to inhabitants of the northernmost regions of the Northern Hemisphere, where it covers great areas and furnishes the chief winter food of the reindeer. It is found in almost all parts of the world, but is most abundant and luxuriant in arctic and subarctic regions, often occupying the ground in pine and spruce forests. When such forests are destroyed by fire it soon reappears. It is a variable plant, but always consists of a much-branched, erect, cylindrical, tubular thallus, with small perforations in the axils, and attains a height of two inches or more. Its importance was first brought into notice by Linnaeus in his *Flora Laponica*. It is sometimes used for human food. Its taste is pleasant, although attended with a slight pungency or acidity. It is generally boiled in reindeer milk. Its nutritious qualities depend chiefly on a form of starch, lichenin, which it contains.

REINECKE, rî'ñck-ê, KARL (1824—). A German pianist, born at Altona. He studied with his father, Johann Peter Rudolph Reinecke, a musical composer and director. He was Court pianist to Christian VIII. at Copenhagen from 1846 to 1848. He became teacher at the Cologne Conservatory in 1851, and occupied at later times the positions of musical director at Barmen, academic musical director and conductor of the Singakademie at Breslau, conductor of the Gewandhaus Concerts at Leipzig, and teacher at the Conservatory. His compositions are both refined and classic throughout, but possess here and there a marked touch of the romantic. Among his works are: *Serenade*, *Vier der Jugendzeit*, *Neues Notabuch für kleine Leute*; *Nocturns*; studies, sonatas, quartets, quintets, and trios. The five-act grand opera *König Manfred* was produced in 1867; the operetta *Ein Abenteuer Händels*, in 1874; two three-act comic operas, *Auf hohen Befehl* and *Der Gouverneur von Tours*, in 1886 and 1891 respectively. He also wrote the funeral march for Emperor William I. He became widely known as an excellent conductor, and as a pianist for his interpretations of Mozart.

REINECKE FUCHS. See RLYNARD THE FOX.

REINHART, rin'härt, CHARLES STANLEY (1844-96). An American genre painter and illustrator. He was born in Pittsburg, Pa. From

1868 to 1870 he studied at the *Atelier Suisse*, Paris, and at the Royal Academy, Munich, under Streyhliker and Olté. Upon his return to the United States he illustrated for various foreign and American magazines, and frequently exhibited works in oil, water colors, and black-and-white at the National Academy. From 1881 to 1891 he resided in Paris, exhibiting regularly at the Salon, afterwards becoming a member of the Society of American Artists, New York. Reinhart excelled in black-and-white, his oils and water colors being mostly marine views, painted in sombre but delicate colors. In oil are: the "Old Life Boat" (1880); "Mussel Fishermen" (1886); "Washed Ashore" (1887), which won the gold medal (Philadelphia, 1888); and the "Rising Tide" (1888), purchased by the Government at the Paris Exposition, 1889. His water colors include "Gathering Wood" (1877), "At the Ferry" (1878), and the "Spanish Barber" (1884). Among his chief series in black-and-white are the "Reichstag Sketches," "A Little Swiss Sojourn," and "Americans Abroad." Reinhart died in New York City, August 30, 1896.

REINHART, CHRISTIAN (1761-1847). A German landscape painter and etcher, born at Hof, Bavaria. First instructed by Biser in Leipzig, he studied at the Dresden Academy under Klengel, but chiefly after the Dutch masters, and in 1789 went to Rome, where he settled permanently and under the influence of Carstens and Koch became a conspicuous exponent of the historic landscape. His best work is represented by the "Eight Historic Landscapes" (1825), in the Palazzo Massimo, Rome, and "Four Views from Villa Malta," in tempera, painted for King Louis I. of Bavaria. The New Pinakothek in Munich contains "Four Views Near Rome" (two dated 1836, 1846), the Leipzig Museum a "Wood on Seashore in a Storm" (1824) and "Landscape with Psyche" (1829), the Städels Institute, Frankfurt, a landscape with "Cain and Abel," and the Cologne Museum a "View from Tivoli." To a collection of seventy-two etchings of prospects in Italy, published conjointly with Dies and Mehan under the title *Malerisch radirte Prospekte aus Italien* (1792-98) Reinhart contributed twenty-four plates, the best of the series. Besides these he etched many other Italian landscapes, and thirty-eight animal studies, in all 170 plates. Consult: Baisch, *Reinhart und seine Krwise* (Leipzig, 1882); and Andresen, *Die Deutschen Maler-Radirer*, i. (ib., 1866).

REINHART VON GRÜNINGEN, fön grüning-en. See GRÜNINGER, JOHANN.

REINHOLD, REINHOLD, CHRISTIAN ERNST (1793-1855). A German philosopher, son of Karl Leonhard Reinhold, born at Jena. He at first lectured on philosophy at the University of Kiel, and afterwards was appointed professor of logic and metaphysics at the University of Jena. His philosophical system resembles Kant's. He published: *Geschichte der Philosophie nach den Hauptmomenten ihrer Entwicklung* (4th ed. 1884); *Theorie des menschlichen Erkenntnisvermögens und Metaphysik* (1832-34); *Lehrbuch der Geschichte der Philosophie* 3d ed. (1849), a work of much value; and *System der Metaphysik* (3d ed. 1854). Consult Apelt, *Ernst Reinhold und die Kantsche Philosophie* (Leipzig, 1840).

REINHOLD, KARL LEONHARD (1758-1823). A German philosopher, born in Vienna. In 1772 he entered the Jesuit College of Saint Anna, but upon the suppression of this Order in 1774 he joined the Barnabites, and was for some years an inmate of their College of Saint Michael. His religious zeal in the meantime had cooled considerably, and in 1783 he left the Order and went to Leipzig, where he devoted himself to philosophy. Afterwards he settled in Weimar. His contributions to the *Deutscher Merkur* attracted much attention, and in 1787 his *Briefe über Kantsche Philosophie* appeared in this periodical. His clear and eloquent exposition of Kant's doctrines, which at that time were being combated, resulted in his being appointed to a professorship of philosophy in Jena. In 1789 he published his chief work, *Versuch einer neuen Theorie des menschlichen Vorstellungsvermögens*, in which he attempts to broaden the teachings of Kant. He then for a time identified himself with Fichte's doctrines and even tried afterwards in his *Paradoxa der neuesten Philosophie* to find a middle way between Fichte and Jacobi in order to satisfy his religious sentiments, but when Bardili's logic appeared he deserted both and joined the latter's rational idealism. The reason for this change he gives us in his treatise *Wahrheit* (1820).

REINICK, REINICK, ROBERT (1805-52). A German painter, etcher, and poet, born and educated in Danzig. He studied painting under Begas in Berlin and at the Düsseldorf Academy, and settled at Dresden in 1844. Several pleasing pictures, either historical or romantic in subject, had come from his brush after 1830—for example, "Rachel and Jacob at the Well" (Stettin Museum), "Well Near Olevano," and several others (Danzig Museum)—but his most interesting productions are those in which his pictorial and poetic talents are blended, such as "Drei Umrisse nach Holzschnitten von Dürer mit erläuterndem Text und Gesängen" (1830). With Kugler he published the *Liederbuch für deutsche Künstler* (1833), with woodcuts by Gubitz, and then the *Lieder eines Malers mit Randzeichnungen seiner Freunde* (1838), with thirty-one etchings by himself and other Düsseldorf artists. He supplied the poetical text to Rethel's "Dance of Death," and was associated with Ludwig Richter in editing Hebel's *Allemannische Gedichte* (1851), of which he gave a High-German version. A sixth edition of his collected *Lieder*, with a biography by Auerbach, was published in Berlin in 1873. His natural ability as a juvenile poet is well exemplified by the *Lieder und Fabeln für die Jugend* (2d ed. 1849), the *Illustrirtes ABC-Buch für kleine und grosse Kinder* (4th ed. 1876), and the fairy-tale *Die Wurzelprinzessin* (1848). The poetical works for young people appeared collected under the title *Märchen-, Lieder- und Geschichtenbuch* (11th ed., Leipzig, 1895).

REINICKE, REINICKE, PAUL RENÉ (1860—). A German painter and draftsman, born at Strenz-Naundorf, near Halle. He studied at Weimar under Struys, at Düsseldorf under Gebhardt, and at Munich under Pighelm, whom he accompanied to Palestine. Settled afterwards in Munich, he found the true field for his talent in drawing sketches for the *Fliegende Blätter*, in which his masterly delineations from the social life of the upper classes in its various aspects soon became an eagerly looked-for specialty. A selection of

his drawings was published in Munich (1890) under the title "Spiegelbilder aus dem Leben." His "Waiting Room of the First Class in the Munich Railway Station" is in the National Gallery, Berlin. He was awarded a gold medal in 1882.

REINKENS, rīn'kēns, JOSEPH HUBERT (1821-96). The first Old Catholic bishop. He was born at Burtscheid, near Aix-la-Chapelle; studied theology at Bonn; was ordained priest of the Roman Catholic Church; and in 1853 was appointed professor of Church history at Breslau. In 1870 he united with Dollinger in the Old Catholic movement, was suspended by the Bishop of Breslau, and the students were forbidden to attend his lectures. In 1873 he was consecrated Bishop at Rotterdam by the Jansenist Bishop of Deventer. He soon took the oath of allegiance to the Government, and was recognized by Prussia as a Catholic bishop, with his residence at Bonn, and remained there in this capacity till his death. His publications include: *Hilarius von Poitiers* (1864); *Martin von Tours* (1866); *Revolution und Kirche* (1876); *Melchior von Diepenbrock* (1881); *Lessing über Toleranz* (1883). See OLD CATHOLICS.

REINMAR VON HAGENAU, rīn'mār fōn hā'ge-nou (?-c.1210). A German poet, one of the first of the minnesingers, usually called Reinmar the Old. From Hagenau he went to Vienna and there taught Walther von der Vogelweide, with whom he may have made the Crusade of 1190. His poetry, artificial, sad, and 'pale-hued,' won him the title of the 'Nightingale of Hagenau' from Gottfried von Strassburg, a panegyric from his pupil Walther, and from Uhland high praise for its sentiment and diction. It is published in Lachmann and Haupt's *Des Minnesangs Frühling*. Consult: Schmidt, *Reinmar von Hagenau* (Strassburg, 1874); and Burdaeh, *Reinmar der Alte und Walther von der Vogelweide* (Leipzig, 1880).

REINSCH, rīnsh, PAUL SAMUEL (1869-). An American historical writer. He was born in Milwaukee, Wis., of German-American parents. He graduated at the University of Wisconsin in 1892, at the law school of the same institution in 1894, and after being admitted to the bar practiced for some time in Milwaukee. Returning to the State University in 1895, he became an instructor and extension lecturer in history, pursuing graduate studies at the same time, and taking the degree of Ph.D. in history in 1898. In 1899 he was appointed assistant professor of political science, and in 1901 professor of political science. His publications include *The Common Law in the Early American Colonies* (1899), *World Politics at the End of the Nineteenth Century* (1900), and *Colonial Government* (1901).

REINTHALER, rīn'thā-lēr, KARL MARTIN (1822-96). A German composer, born at Erfurt. He studied music under A. B. Marx, and, later, in both Paris and Rome. In 1853 he was appointed teacher at the Cologne Conservatory, and in 1858 became municipal music director and cathedral organist at Bremen, where he also conducted the cathedral choir, the Singakademie, and the concert society. He retired in 1893. His best known works are the oratorio *Jephtha*, the *Bismarck-Hymne*, the choral works *In der Wüste*, and *Das Mädchen von Kōlah*, and the operas

Edda (1875) and *Katchen von Heilbronn*, which gained a prize at Frankfurt in 1881.

REIS, rīs, PHILIPP (1834-71). A German physicist, born at Gelnhausen. In 1858 he became a teacher in the Garnier Institute, near Homburg, and there, after two or three years of research, in 1860 he produced the first telephone. It transmitted musical tone, but not the intelligible utterances of the voice. Reis gained no benefit from his invention. In 1885 a monument was erected to him in his native town. Consult Thomson's English version of the biographical sketch by Schenk (London, 1883).

REISEBILDER, rī'ze bīl'dēr (Ger., pictures of travel). A work by Heinrich Heine in four volumes (1826-31), in which poetic descriptions of nature and powerful delineations of character are mingled with scoffs at the institutions of the age, political, religious, and social. The wit and irreverence of these attacks, which respected nothing, together with the real beauties of the work, won for it an immediate success and brought the author into popular favor. Some of the poems interspersed through the work were published later with others under the title of *Buch der Lieder*.

REIS EFFENDI, rā'īs ēf fēn'dī (Turk., presiding official). A title formerly given to an officer of State in the Ottoman Empire. He was the Chancellor of the Empire, and Minister of Foreign Affairs. His duties in the first-mentioned capacity was to confer with the Grand Vizier regarding the orders and instructions to be sent to the different provinces and regarding the proper decision on any subject affecting the Empire, whether internal or external; and in the latter capacity he had the sole and exclusive charge of the relations of the Porte with foreign courts.

REISKE, rī'ske, JOHANN JAKOB (1716-74). A celebrated German philologist and Oriental scholar. He was born at Zörbig, Prussian Saxony, and was educated at the University of Leipzig, where he devoted much attention to the study of the Semitic languages, especially Arabic. In 1758, after living in abject indigence, he obtained the rectorship of the Nikolai Gymnasium, in Leipzig, and he retained the post till his death. From 1758 he devoted his attention chiefly to Greek literature, in which he became a recognized authority. His works, which are very numerous and are remarkable for their learning, include his *Animadversiones in Græcos Auctores* (1757-66), and editions of Theocritus (1765-66); of the Greek orators (1770-75); of Maximus Tyrinus (1774-75); of Dionysius of Halicarnassus (1774-77); of Plutarch, with notes and translations (12 vols., 1774-82); Dio Chrysostom (1784-98); and Libanius (1791-94). Reiske was also the first to call attention to the historical and æsthetic value of Arabic literature. His chief work in this field was his Latin translation of the *Annales Moslemici* of Abulfeza (1751; frequently reëdited). Some of these works, and his correspondence with Moses Mendelssohn and Lessing, were published after his death, by his wife, Ernestine Christine Reiske (1735-98). Consult: Morus, *Vita Reiskii* (Leipzig, 1777); Reiske, *Selbstbiographie* (Leipzig, 1793); and Haupt's *Opuscula* (Leipzig, 1875-76).

REISS, rīs, WILHELM (1838-). A German traveler and naturalist, born at Mannheim. He

traveled in the Azores, Madeira, and Canary Islands in 1858-60, in Greece in 1866, and with Stübel in 1868-76 explored South America. In particular he visited Ecuador, Colombia, Peru, and Bolivia, and he and Stübel were the first to ascend Mount Cotopaxi. The scientific results of this journey were of much value. Reiss was president of the Berlin Gesellschaft für Erdkunde in 1883-87, and of the Anthropological Society in 1888. In addition to contributions to the publications of the Gesellschaft für Erdkunde and various scientific journals, he wrote: *Das Totenfeld von Ancon in Peru* (1880-86); *Geologische Studien in der Republik Columbia* (1892-99); and *Das Hochgebirge der Republik Ecuador* (1892-1902).

REISSIGER, ris'zig-er, KARL GOTTLIEB (1798-1859). A German musician, born at Wittenberg. He studied under Schicht at the Thomasschule at Leipzig, and dramatic composition under Winter at Münnch. He taught at the Berlin Royal Institute, and in 1826 went to The Hague, where he organized a conservatory which is still prosperous. This same year he succeeded Marschner as musical director of the German Opera at Dresden, and later was appointed Kapellmeister, as Weber's successor. He wrote: *Dilone abbandonata* (1823); *Die Falschmähle von Elsbärens* (1829), the overture of which is still played at concerts; *Turandot* (1835); *Adèle de Poir* (1841); masses, psalms, symphonies, overtures, sonatas for violin and 'cello, and the oratorio *David*. . . *Weber's Last Thought*, a waltz, is his most popular piece.

REISSMANN, ris'mán, AUGUST (1825-1903). A German writer on music, born at Frankenstein, Silesia. He studied at Breslau under Mosewius, Baumgart, Richter, Lüstner, and Kahl. From 1866 to 1874 he lectured on the history of music at the Stern Conservatory in Berlin, from 1880 at Leipzig, and later at Wiesbaden. *Das deutsche Lied in seiner historischen Entwicklung* (1861) is his best and most original work. His other historical works, mostly clever collections or extracts from original studies made by others, include: *Von Bach bis Wagner* (1861); *Allgemeine Geschichte der Musik* (1863-65); *Illustrierte Geschichte der deutschen Musik* (2d ed. 1892); and the biographies of various composers. He also composed an oratorio, *Wittchind*, two operas, symphonies, chamber music, and songs.

REITBOK (from Dutch *rietbok*, reedback, from *riet*, reed + *bok*, buck). One of the small antelopes, called by English sportsmen in Africa 'reedbucks.' See REEBUCK.

REJ, rej', MIKOLAJ (1505-69). A Polish poet and prose writer, born in the Ukraine. He was more than sixty years of age before he produced his principal poem, *Zwierzciadło* ("The Mirror," 1567, reprinted in 1829). Nine years previously his *Wizerunek obrazny zywota celniewicza porzeczego* ("Picture of an Honorable Man," 1558, reprinted at Warsaw, 1881-88) had appeared, and besides metrical Polish translations of the Psalms (1533), *Postylla Polska* (Gospel Commentaries, 1556), and a catechism, he published *Zawot Józefa* (1545), *Zwierzynice* (1562), and *Figliki* (1568). A stout Calvinist, he wrote much in defense of his chosen creed and was one of the first to use Polish as a literary language. His prose shows the language in its

purity, before the introduction of foreign words and forms.

RÉJANE, rézhán', MARIAME (1857—). The stage name of Gabrielle Réju, a French actress, born in Paris. She made her début at the Vaudeville in 1875, and soon gained a reputation for her witty impersonations. In 1892 she married M. Porel, then her manager. In 1893 she created her best-known rôle of *Madame Sans Gêne*, written for her by Sardou. She appeared with it in London in 1894, and in the United States in 1895. Afterwards she appeared in *La douloreuse* and *Zaza*.

REJECTED ADDRESSES. Burlesque poems by James and Horace Smith, published anonymously in 1812. Ostensibly unsuccessful efforts in the competition for the opening of the new Drury Lane Theatre at that time, they were amusing parodies on the poems of Wordsworth, Southey, Coleridge, Byron, Scott and others.

REJOINER (OF). F. *rejoindre*, to rejoin, from Lat. *re*, back again, anew + *jungeré*, to join). In common-law pleading, the answer of a defendant to a plaintiff's replication to his (defendant's) plea. See PLEADING.

REJUVENATION, or REJUVENESCENCE. It is supposed by Maupas and others that the process of conjugation in the Infusoria (q.v.) results in increased vigor and vitality, and is thus advantageous to those organisms in which the most primitive form of reproduction is by simple self-division. Indeed it has been observed that conjugation results in increased activity in multiplication by fission. So also sexual reproduction is a rejuvenizing process, and tends to prevent both the individual and the species from deteriorating or running out. It may be said to correspond in its effects to cross-fertilization, which is the antidote to too close in-breeding and tends to enhance the vitality of the species and prevent degeneration. In botany, a transformation of one cell into another, i.e. into a primordial cell, which afterwards secretes a new cell-wall, and forms the starting-point of the life of a new individual. Examples occur in numerous algae (Edogonium), and also in certain diatoms. See GROWTH.

RELAPSE. THE; OR VIRTUE IN DANGER. A comedy by Sir John Vanbrugh, produced in 1697. It was written as a sequel to Cibber's *Love's Last Shift*, and was very popular throughout the eighteenth century. It was imitated by Lee in *A Man of Quality* (1776), and recast by Sheridan as *A Trip to Scarborough* (1777). Voltaire used it as the basis of *Le Comte de Boursouffle* (1734). Later versions were made by Hollingshead in *Man of Quality* (1870) and Buchanan in *Miss Tomboy* (1890).

RELAPSING FEVER (from Lat. *relapsus*, p.p. of *relabi*, to fall back, from *re*, back again, anew + *labi*, to slip), FAMINE FEVER, or FEBRIS RECURRENS. A specific infectious and contagious disease, generally occurring in epidemics, and due to a micro-organism, the *spirochæta Obermieri*. This organism is a spirillum, about $\frac{1}{1000}$ of an inch in length, and undergoing constant movements of a rotary or lashing character. The disease occurs in times of famine and flourishes under conditions of overcrowding, dirt, and poverty. Individuals in constant contact with the disease, as physicians, nurses, and clergymen, are often

attacked. The peculiar nature of the malady was pointed out by Henderson in 1842 and by Sir W. Jenner, 1849 to 1851. Their views have since been confirmed by the discovery of the specific micro-organism by Obermeier.

The period of incubation of relapsing fever averages from 4 to 10 days. The fever begins suddenly with a chill or rigor, accompanied by frontal headache, and pains in the back and limbs. The temperature may be 103° or 104° F., and mounts on the succeeding days to 105° or even 108°. The general condition remains much the same for about a week, except that the symptoms increase in severity. Little sleep is obtained, but the mind remains clear until near the end of the paroxysm, when delirium supervenes. When all the symptoms are at the height, crisis suddenly occurs in 5 to 7 days, with profuse perspiration and a rapid abatement of suffering. Convalescence now sets in and is permanent in many cases. In others the patient feels comparatively well, but very weak until about fourteen days from the initial attack or seven days after the crisis, when he is again seized with chills and fever, and the whole series of phenomena is repeated. This relapse is usually shorter than the first paroxysm, and permanent recovery follows it in the majority of cases.

The spirilla are always present in the blood during the paroxysms and increase in number as the fever progresses. They disappear at the crisis and remain absent until near the advent of the relapse. During this period they may be found in the spleen and bone marrow (as proved by experiments on monkeys), where they probably break down and leave spores which germinate and thus produce the organisms which determine the relapse.

No treatment has succeeded in shortening the paroxysms or preventing the recurrence of a relapse; and although certain drugs, such as quinine, carbolic acid, and iodine, arrest the movements of the spirillum outside the body, they have no influence when given as remedies. Treatment must be symptomatic. Sponging with tepid water or packing in wet sheets will give temporary relief when the fever is very high, and headache may be relieved by cold applications. During the severe perspiration of the crisis the patient must be kept as dry as possible, and the tendency to collapse must be met by additional coverings, hot bottles, and diffusible stimulants. For the severe pains opium or morphine is given. Cooling drinks and gentle saline laxatives increase the comfort of the patient. During convalescence, fresh air, good food, and tonic medicines are indicated. The disease is rare in this country, no epidemics having appeared since 1869, when it prevailed extensively in New York and Philadelphia. It is common in India, where favorable conditions for its development seem always to be present.

RELATIONS (Lat. *relatio*, relation, reference, report, restoration, from *re*, back again, anew + *latus*, p.p. assigned to *ferre*, to bear, carry). In law, technically, such kindred of a person as may be entitled to share in his personal estate under the statute of distributions in force in the jurisdiction in which the meaning of the word is called in question. The word, therefore, is employed in a wider sense in some jurisdictions than in others, and the classes of persons

included vary according to the jurisdiction. It is popularly employed to describe all family connections by blood or marriage, and the law will recognize this use of the word where it is evident a person so intended to employ it. See **AFFINITY**; **CONSALEQUINITY**; **LINIAL**. See also Blackstone's *Commentaries*.

RELATIONSHIP. The exact degree of affinity existing between keys, chords, and tones. See **TEMPERAMENT**.

RELATIVITY (from Lat. *relativus*, having reference or relation), LAW OF. In its most general form, the law, as given by Stumpf, is that the relation of sensations to one another is essential to their very existence; so that black, e.g. can be sensed only in opposition to white, or at least only in distinction from a grayer or blacker black; a tone or noise only as alternating with other tones or noises, or with complete silence, and so on—while every sensation will disappear under the operation of uniform and continuous stimulation. Simple as this statement looks, it is capable of many interpretations, none of which can be regarded as unexceptionable.

The grain of truth which Stumpf finds in the doctrine is that the presence of sensation in the adult consciousness is almost without exception connected with certain judgments of its relation to other ideas. And these judgments (apprehensions, apperceptions), if they cannot alter the content of sensation, can at least render it confusable with other contents not now sensed. Wundt, on the other hand, has consistently maintained that our mental life is governed by a law of relativity, such that every phase of present experience is conditioned not only by other phases of the same experience, but also by the whole past history of consciousness. The laws of mind at large are of two classes: laws of relativity and laws of development. Under the heading of relativity we have (1) the law of psychical resultants, which affirms that every mental complex shows properties which, once given, can be understood from the attributes of its elements, but which cannot be regarded as a mere sum of those attributes, (2) the law of relations asserts that every dissection of a conscious whole into its constituent terms is an act of relating analysis. Finally, (3) the law of psychical contrasts maintains that mental processes of opposed direction mutually reinforce one another. The laws of mental development are (1) the law of mental growth, the application of the law of resultants; (2) the law of heterogeny of ends, based upon the laws of resultants and of relations; and (3) the law of development by opposites, which applies the law of contrasts. Consult: Stumpf, *Tompsychologie* (Leipzig, 1883); Riehl, *Der philosophische Kriticismus*, vol. ii. (ib., 1879-87); Preyer, *Elemente der reinen Empfindungslehre* (1877); Wundt, *Outlines of Psychology* (trans. Leipzig, 1897); id., *Physiologische Psychologie* (4th ed., ib., 1893); Hölting, *Outlines of Psychology*; Spencer, *Principles of Psychology* (London, 1881); Bain, *The Senses and the Intellect* (ib., 1868).

RELEASE. In the most general sense, any act, event, or instrument by which a legal right is discharged. In this sense of the term a right of action based upon a personal tort may be re-

leased by the death of the tortfeasor, or a debt released by the discharge in bankruptcy of the debtor, as well as a bond or a right of entry upon land released by the deed of the person claiming the right. Lord Coke, in his commentary upon Littleton, enumerates a considerable number and variety of releases in vogue in his day, most of which have, in the growing simplification of the law of real property, become obsolete. We may, perhaps, conveniently distinguish two separate and distinct types of releases as still existing, viz. the ordinary release of a debt or obligation and the release of an interest in or claim to land.

The former of these may be effected by act of the parties, or by operation of law—as where a contract for personal services is terminated by the death of a party thereto. At common law, however, the forgiveness of a debt, whether complete or partial, is not legally binding if made by parol or simple contract, but requires a release under seal to render it effectual and irrevocable.

The second form of release above referred to is best described as a form of conveyance of real property at common law. Its distinguishing characteristic is the fact that it is in and by itself not available for effecting a conveyance to a stranger, i. e. to one having no interest in the land in question (for which purpose the feoffment or the grant must be resorted to), but only to one in privity of estate, i. e. having an interest with the releasor in the same parcel of land, as a wife to the husband's grantee, or a landlord, remainderman, or person asserting any other claim in relation to the premises to a tenant in possession. The act of the tenant in giving up his estate to the landlord is not a release, but, involving as it does a transfer of the possession, is conceived of as of a totally different character, and is effected by a distinct form of conveyance, called a surrender.

In this form of a conveyance of the landlord's estate to his tenant in possession the release played a distinguished part in the history of conveyancing. In the effort to attain to a simpler and less notorious method of conveying freehold estates than the ancient and cumbersome process of livery of seisin, the lease and release were ingeniously combined in a single transaction. Thus, if the land to be sold by A to B was first leased to B for a year, B would by taking possession of the land come into the requisite privity of estate with A to enable the latter to complete the transfer of title by releasing his reversion to B. Consult Blackstone and Kent, *Commentaries*. See also PROPERTY; LEASE AND RELEASE; CONVEYANCE; DEED; GRANT, and the authorities there referred to.

Analogous to the first form of release above described, but still operating as a common-law conveyance, is its use to convey doubtful or precarious interests in land or rights in land which do not rise to the dignity of estates, as a contingent remainder to the freeholder who was seised of the land, or the right of a disseisee to the disseisor or other person seised of the land. See DISSEISIN; ENTRY, RIGHT OF; REMAINDER.

In form the deed of release is substantially reproduced in the modern quitclaim deed. See QUITCLAIM.

RELIANCE. An American racing yacht, and the successful defender of the America's Cup in

the International yacht races of 1903. She was built by Herreshoff, for a syndicate of American yachtmen, represented by C. Oliver Iselin. Her measurements were: Length over all, 143.69; water line, 89.66; sail area as per rule, 16,159.45; sail area, 127.12. Owing to her large sail area she was required to give the challenger Shamrock III. (q.v.) a time allowance of one minute and fifty-seven seconds. She was sailed by Captain Barr, the skipper of the old Columbia, and defeated her opponent in the first three races of the series as follows: August 22d, by 7 minutes and 3 seconds, corrected time; August 26th, by 1 minute and 19 seconds, corrected time; September 3, the challenger got lost in the fog and did not finish the race. Reliance alone completed the course.

RELICS (OF., Fr. *relique*, from Lat. *reliquia*, remains, from *relinquere*, to leave behind, from *re-*, back again, anew + *linquere*, to leave, Gk. *λείπειν*, *leipein*, Skt. *ric*, to leave). In ecclesiastical usage, the remains of the bodies of saints; more loosely, objects connected with the earthly life of Christ or of the saints. At an early period miracles are described as connected with relics, as in the Old Testament (II. Kings xiii. 21). Saint Ambrose tells of a blind man's sight being restored by his touching the bodies of the martyrs Gervasius and Protasius, and similar wonders are detailed by other saints. Altars were early erected over the tombs of the martyrs, and the present practice of the Roman Catholic Church requires the inclusion of some relic or relics within every altar to be consecrated.

The veneration of relics found no important early adversary. One of the treatises of Saint Jerome, indeed, is directed against the objections of Vigilantius on this point; but even the Iconoclasts, while vehemently repudiating the use of images, admitted the veneration of relics, and, with the exception of the Waldenses, Wiclif, and some others, it was practically unchallenged until the sixteenth century, when Protestants generally repudiated it entirely as superstitious. The decree of the Council of Trent connects the question with the general one of the veneration to be paid to the saints, and regards the relics of the saints not as possessing any intrinsic virtue, but as instruments through which God bestows benefits on men. Various alleged relics of Mohammed and other Moslem worthies are preserved at Mecca, Medina, Constantinople, and other places; and several sanctuaries in India are supposed to be the resting-places of relics of Buddha. See SAINT; CROSS; HOLY COAT; PILGRIM.

RELICT PLANTS (OF. *relict*, from Lat. *relictus*, p.p. of *relinquere*, to leave behind). Plants of very restricted distribution, but formerly more widespread. For example, the big trees of California are the remnants of a former widely distributed group. The term may also be applied locally to species which belong to a former topographic condition when they were abundant. Naturally or artificially reclaimed swamps may yet retain isolated relict plants.

RELIEF (Lat. *relevamentum*). An incident of the feudal tenure of lands. It consisted in the obligation of the heir to redeem the land from the lord of whom it was held, in order to make good his right of inheritance. Unlike the

more burdensome incidents of wardship and marriage, it attached not only to lands held by knight's service, but was levied equally on the heir of socage lands. Originally of indefinite amount and depending largely on the arbitrary will of the lord, it was at an early period fixed and regulated by statute. Of all the incidents of feudal tenure, it had the longest life, not only surviving the gradual disappearance of military tenures, but being expressly saved in the statute of 12 Charles II. (1660), which abolished tenure in chivalry and relieved all tenures of their more burdensome incidents. The right of relief was never expressly abrogated, but it has fallen into desuetude in England, and there is no evidence that it was ever exercised in the United States. See FEUDAL TENURE; INCIDENT.

RELIEF SCULPTURE. That form of sculpture in which the objects represented project from the surface or background. In the fine arts the term relief is used to signify any projection of figures from the surface; it is so used in painting for the apparent projection of forms and masses from the background, in architecture for projection of decoration, and in a similar manner in ceramics, goldsmith's work, etc. The term is, however, mostly employed in reference to sculpture. Relief sculpture differs from sculpture in the round in that it is attached to the background, from which the latter stands free, being visible from all sides. It is not always possible, however, to distinguish the boundaries between these two chief classes of sculpture. See SCULPTURE.

The two principal varieties of relief sculpture are: high relief, usually known by the Italian name *alto-relievo* (q.v.), in which the objects project strongly from the background; and low relief (Italian, *basso-relievo*; French, *bas-relievo*), a surface ornamentation in which the projection is very slight. Midway between the two is semi-relief (Italian, *mezzo-relievo*; French, *demi-relief*), in which the figures are fully rounded, but without detached portions. *Stiacciato* (Italian, crushed, flattened) is the slightest form of relief, being little more than scratches upon the surface, while in the hollow relief (*cavo-relievo*) (q.v.) the contours of the figures are carved below the surface of the background. In nearly all relief work figures and background are of the same material, though there are some examples to the contrary in best Greek art, and in Chinese and Japanese decorative work. The materials generally used in larger relief work are marble, bronze and sometimes terra cotta, and in smaller decorative work the precious metal and stones, enamel, ivory, wood, etc., are more common. Reliefs were almost universally colored by the Egyptians and in classical antiquity and partly in early Christian art. This practice prevailed in wood, terra cotta and stucco work during the Gothic and Renaissance periods, while marble and stone were not usually colored.

HISTORY. Relief is that form of sculpture which most resembles painting, with which it has composition and perspective in common. In the history of relief work, therefore, the practice has swayed between purely plastic and pictorial principles. Relief was practiced contemporaneously with sculpture in the round by the early culture peoples, like the Babylonians, Assyrians, and Hittites. The Egyptians made a very wide use of *cavo-relievo*. The Greeks con-

ceived relief in a purely plastic sense and achieved the highest mastery of it. Distinguishing strictly between high and low relief, they used the former between the triglyphs, and in the tympana of the temples, but the latter in friezes, grave stones, and the like. Purely decorative principles were strictly followed, the space being adequately filled, the background never carved, and the heads of the figures at the same height. (See GREEK ART.) During the Hellenistic period a more picturesque and dramatic composition was practiced, and subjects were carved in the backgrounds—a practice which in Roman times degenerated into the use of several different planes of reliefs. Picturesque relief attained its most perfect development at Florence during the Renaissance, in such works as the Baptistery doors of Ghiberti and the marble pulpit of Santa Croce by Benedetto da Majano. In these works all the qualities of painting except color were reproduced. Donatello, Luca della Robbia and other sculptors of the Renaissance followed plastic laws more strictly, but during the entire Baroque period, picturesque principles prevailed to such an extent as to preclude any real style of relief. At the beginning of the nineteenth century Thorwaldson, inspired by the study of Attic grave monuments, brought back relief to its proper plastic function. Since that time excellent relief work has been done in Europe by modern German sculptors like Rauch and Rietschel and by Frenchmen, like Jules Dalou, and also in the United States. The present tendency, however, is to neglect the distinction between high and low relief and to give rather undue emphasis to pictorial qualities.

RELIEF SYNOD. See PRESBYTERIANISM.

RELIGIO MEDICI (Lat., A Physician's Religion). A prose work by Sir Thomas Browne (1643). Written about 1635, but not for publication, which was necessitated by an unauthorized edition in 1642, this prose poem is the devout musing of a scholar and man of science, and withal a mystic, who sought a Divine presence in nature and in all conditions of his own life. The first part treats of Faith and Hope. The second, on Charity, shows a tolerance unusual in that day.

RELIGION (Lat., *religio*, probably from *re-ligare*, to bind fast, from *re*, back again, anew + *ligare*, to bind). COMPARATIVE. The science which treats of religions from an historical and comparative point of view. Its methods are first descriptive, then historical, and finally comparative. The descriptive part of comparative religion discusses in detail the actual phenomena, or any particular phenomenon, presented by religions, and includes treatments of individual religions. Even in such an individual discussion, the comparative method must be employed if the phenomena presented by the religion in question are to be correctly interpreted. While the descriptive part of the science is confined, strictly speaking, to the status of religion, that is, to the phenomena observable at any specified time, the historical aspect considers the development of a single faith from its origin or from its earliest ascertainable manifestation to its extinction, or absorption into other religions, or the latest development which it has attained. The historical side of comparative religion, therefore, is evolutionary in character. The com-

parative study in the strict sense of the term may, technically, be static. The value of such an investigation is, however, so much inferior scientifically to evolutionary comparison that it may practically be ignored. By far the greater number of investigations make their studies of comparative religion historical or evolutionary. Such discussions alone lead to the final object of the science. This object is to investigate the nature and development of religious beliefs and to discover if possible the origin of religion itself. Comparative religion therefore ranks as one of the historical sciences.

DEFINITION OF RELIGION. Nowhere is definition more difficult than in the sphere of religion. The manifestations are so varied, and the causes, where they can be traced, are so complex, that almost no definition of religion can be given which is altogether free from objection. The definition which seems on the whole least open to adverse criticism is as follows: Religion is the view held by man of an intelligent being or beings which is or are, or which he conceives to be, superhuman, and of the relation, modifiable by his own agency in certain respects and by certain means, which he sustains toward the being or beings in question. This definition recognizes the two-fold aspect of religion, which accounts for part of the complexity of religious phenomena, the theoretical and the practical. The theoretical side of religion is the view held by man regarding the nature and character of the superhuman being or beings in which he believes. The practical side is the power which such being or beings exert over him and the power which he has or may acquire over them.

UNIVERSALITY OF RELIGION. The statement which is still made, though with decreasing frequency, that there are races or tribes without religion is almost certainly false. It may be true that many peoples seem to possess no religion, either because these religions are so obscure as to pass unnoticed, or because they are contemptuously rejected as false. Yet even the scientific investigator may be misled in this matter. In the first place, the person questioned as to his religion may not, and in the case of savages often does not, understand the questions which are asked him. His answers, therefore, are misleading. It must also be remembered that one questioned concerning his religion will sometimes willfully give a false answer, either because he regards the inquiry as foolish, impertinent, or tiresome, or because he does not dare to reveal his religion. In giving a knowledge of his religion, one gives a part of himself, and the power thus gained by another may be used to his own detriment. If these obstacles to an accurate knowledge of a religion exist in the case of living faiths, they hold to a far greater degree in the study of extinct religions or extinct phases of them. The ancient writers who describe foreign religions were either little acquainted with them and unscientifically trained, as were even Herodotus and Plutarch, or were contemptuous and unsympathetic, as was Tacitus. Moreover, the sacred books of religions give us only a partial view of their own faiths. They represent only the officially sanctioned religion, while the popular deviations from these book-religions are either ignored altogether, or mentioned with disparagement and hostility, or must be partially reconstructed

from chance allusions scattered through the canonical works. There is also a marked tendency both in ancient and in modern investigators of religion to interpret foreign religions in terms of their own, thus leading to false identifications and to attributions of concepts to religions which they may not contain. The student of religion must also guard against mistaking an idea previously imported into a religion from a foreign source for an integral part of the faith which he studies.

CLASSIFICATION OF RELIGIONS. Still more difficult than definition of religions is classification. While one may make rough distinctions between various religions, hard and fast lines of demarcation can seldom be drawn, for religions often overlap one another in attributes common to both. Nor is it easy to classify a religion according to its salient feature. To say that Greek religion is the cult of the beautiful, or that Roman religion is legalistic, or that American religions are animistic, does not adequately describe them, for they represent the culminations of long evolutions, in which many factors from many sources have cooperated. Animism, totemism, ghost-worship, nature-worship, and other factors, all combine in different proportions. Several classifications, however, have been proposed. Of them all, the most simple and the most worthless divides religions into true and false, the first class holding the single religion adopted by him who makes the classification, the latter class containing all the rest. There are a number of other classifications which are equally unsatisfactory. Among these may be enumerated the division of religions on a linguistic basis into Indo-Germanic, Semitic, and Turanian. This classification, proposed by Max Müller, proceeds on the false premise that religion and linguistic affinity are one. A religion may indeed originate in a certain race, but it may spread with equal facility to other races, and even to other climates and entirely different systems of civilization. The division into national and universal or international religions, advocated by Kuenen, is also objectionable, since there is no real line of demarcation between the two. Comparatively primitive religions may be international, on account both of their catholicity and of the absence of any national idea, while very advanced religions, as Zoroastrianism, may be strictly national, although apparently intended to be international in scope. Hegel attempted a classification, in four divisions. The most primitive faiths, or nature religions, he regarded as spontaneous. To them he opposed the religions of spiritual individuality, which was differentiated from nature religions by the presence of reason and meditation. Within the religions of spiritual individualities there are three divisions: First, the religion of majesty, where the divine overwhelms the human; second, the religion of beauty, where the divine blends with the human; and third, the religion of design, where a divine purpose in the universe is recognized. The increased knowledge of the evolution of religion since Hegel's time has rendered this view of his useless. A marked advance was the classification of Hartmann, who made a broad division into naturalism and supernaturalism. Naturalism is characterized by a belief that deities rule in the world and require material representations, while in supra-

naturalism the deities rule over the world, and are freed from the necessity of representation. In the former class are primitive religions and such advanced ones as the Greek, Roman, Teutonic, and Egyptian, while in the second category come, among others, Buddhism, Judaism, and Mohammedanism. The final stage is a monism where the absolute spirit is a unity which is the absolute source and being of the universe. The chief weakness of the system is the tendency already noted to characterize religions only by salient features, without taking into account phases equally important though less obtrusive. A classification which combines the historical and philosophical points of view was prepared by Réville. Making a broad division into polytheistic and monotheistic religions, he included in the first category primitive nature religions, animism, and fetishism. These were followed by national mythological religions, such as the Chinese, Egyptian, Babylonian, Teutonic, Celtic, Greek, and Roman. The fourth stage is characterized by the legal element, as seen in Brahmanism, and here he also reckoned the Chinese systems of Confucius and Lao Tse. The highest point of polytheism was reached in his opinion by Buddhism. The monotheistic religions, which compose his second main division, are Judaism, Mohammedanism, and Christianity. Against this classification may be alleged that (1) there is no such sharp dividing line between animism, fetishism, and mythology as is here implied, and (2) the demarcation between polytheism and monotheism is evanescent. In the religions of Egypt, Babylonia, India, and Greece, which were admittedly polytheistic, a monotheistic trend, especially among philosophers, was marked, and conversely, in religions essentially monotheistic, such as Zoroastrianism, there is a tendency toward reversion to or survival of polytheistic cults. The important step in advance in Réville's classification is his recognition of the importance of the legal factor. Tiele set up a scale of primitive, naturalistic, animistic, national, polytheistic, nomistic, and universal religions. This scheme later was somewhat modified by him, and he finally favored a division into nature religions and ethical religions. Still another classification was proposed by Jastrow. Its division is fourfold, into the religions of savages, of primitive culture, of advanced culture, and those religions whose conscious ideal is the coextensiveness of religion with life and complete harmony between the doctrines and the practices of religion. This classification, like the others, is unclear in the distinction between the first two divisions, while the third and fourth in like manner are somewhat arbitrary. It seems, however, superior on the whole to all its predecessors, despite the credit which the classifications of Tiele and Réville deserve. Adopting this system of Jastrow's, then, with the modification of combining his first two divisions, the broad outlines of the principal forms of religion may be sketched, while the detailed treatment both of individual religions and of numerous special phases of comparative religion will be found under separate titles.

THE RELIGIONS OF SAVAGES AND OF PRIMITIVE CULTURE. The religion of the savage, connoting by this term man in the pre-cultural stage, is almost impossible to determine. The difficulties already enumerated oppose the solution of this

problem. It is, moreover, a question whether pre-cultural man, unalloyed by cultural races—however primitive, now exists. Only within comparatively recent times has the intercommunication of ideas between the less civilized races both of ancient and modern times received due recognition. Even the most primitive religions known, such as the Australian, belong to tribes which have begun the cultural stage. We are reduced, therefore, for our knowledge of savage religions to deductions which may be made from more advanced cults, especially those of primitive peoples. This uncertainty is the more unfortunate, since it is here if anywhere, from a scientific point of view, that we are to seek the origin or origins of religion. The most that can be said of this most primitive stage seems to be that there was probably an innate germ of religious thought, a vague personification of the powers of nature, and the first beginnings of a belief in ghosts.

Turning to the religions of primitive culture we find a wide range of cults in all parts of the world, of most varied grades. Among the most important may be mentioned the Polynesian and Australian, the diverse native religions of Africa, the Finno-Tataric, many phases of Hindu religion, especially among the Dravidians, the Mongolian Shamanism, the ancient Teutonic religions, and the American religions, including those of Mexico and Peru. The diversity of the primitive cults is evident, ranging from the rude religions of the Hottentots and Blackfellow to the elaborate mythology of Polynesia and the developed ritual and priesthood of Mexico. The religions of primitive culture, however, may all be characterized by at least four points in common; animism in belief, magic in practice, and in worship nature-worship and ancestor-worship. Of these the most primitive seems to be animism. This may be defined as a belief which ascribes conscious life to every natural object which manifests vitality or force in any way. It is the theory evolved by primitive man to account for the various natural phenomena by which he is surrounded. The ascription of life analogous to his own to trees, rivers, fire, and the like is not necessarily religious in itself, but the transition from animism in theory to animism in cult seems to involve a recognition of their super-human powers. If a river is endowed with life as is a man, it has power to benefit, as in irrigation, or to injure, as in flood, and it becomes necessary either to propitiate the river that it may be bounteous in its waters, or to induce it to refrain from destructive floods. The primitive means of controlling the powers of nature is by magic. If the desired results do not follow the performance of magic, the fault is not with the magic itself. Either wrong magic has been employed for the end in view, or there is a strong counter magic at work, which must first be overcome if possible. For magic is, in its last analysis, the science of primitive man, the cause, real or supposed, of a given result, which must, by its performance, produce again the desired result, and this fact accounts for its early importance and its extreme tenacity.

Within the sphere of religion proper we have, as common to all religions of primitive culture, nature-worship and ancestor-worship, the developed forms of the beliefs in animism with magic and ghosts with magic respectively. To

this same stage of development belong some of the most important aspects of religion. As an evolution of ghost worship comes the belief in totemism, which derives whole tribes or families from an animal or plant. This animal or plant is consequently regarded as a blood relative of the tribe or family in question, and therefore becomes sacrosanct, so that it is neither eaten, killed, nor harmed in any way by one whose totem it is. Another mixture of magic and animism is seen in fetishism, which ascribes superhuman properties to material objects. Developments of magic are seen in the important phenomena of taboo and Shamanism. To this same period belongs the evolution of the priest. While the savage was able to perform his own religious rites, the increase both in number and complexity of sacrifices and magic rites rendered necessary the presence of a body of men who stood in especially close relations with the superhuman beings, and who came in course of time to have entire control both of cult and religion. As intermediaries between the gods and men, the priests naturally came to be regarded as healers of disease by their magic arts, and the knowledge of medicine was, consequently, practically in their possession alone throughout this period and at least the earlier portion of the succeeding one.

THE RELIGIONS OF ADVANCED CULTURE. In the religions of advanced culture, which, as has already been said, are closely connected with those of primitive culture, are contained the religions of Egypt, Babylonia and Assyria, China, India (excluding Buddhism), Greece, and Rome. It is at once obvious how varied are the spirits of these religions, yet there is one common factor which may serve to characterize them all, and which may, at the same time, be made a line of demarcation between the faiths of advanced and of primitive culture. This factor is the predominance of mythology over animism and magic. While the mythological element is of importance in many of the religions of primitive culture, and while it is seen at a comparatively early stage, it is overshadowed by animism and magic, and plays relatively little part. Even in the most highly developed religions of this class, such as the Polynesian, which has a mythology almost rivaling that of the Greeks, this statement holds good. On the other hand, while the religions of advanced culture, especially the more ancient ones of Egypt and Mesopotamia, contain abundant traces and instances of animism and of magic, even in their early epochs the mythology is the most striking feature. Mythology in itself is a process and a proof of higher culture. Based in part on early tribal history and ancestor-worship, as may clearly be seen in the case of Greece and Rome, and in part on nature-worship, as is evident in India, it involves a power of abstract thought beyond the capability of primitive culture in its early stages. But, on the other hand, mythology is a check on religious growth. As the people progresses in religious life and thought, while mythology, like ritual, remains stationary or moves much more slowly than the actual popular religious faith, a constantly widening gap appears between religion and mythology. As in the religions of primitive culture the animism and magic which characterize them in their earlier stages become relatively less important

in their later developments, so in the religions of advanced culture the mythology which is at first their leading feature becomes more and more secondary in course of time. In many instances in a more refined community the old myths are felt to be immoral. Attempts are, therefore, made to explain away this immorality, to which the masses still cling tenaciously, by poetical, allegorical or esoteric interpretations as in the explanations of the erotic Krishna myths in India as mystic portrayals of divine love. Yet these explanations are, in the nature of the case, inadequate, and there is thus created a division between religion and ethics, which it is the task of the next and final stage of religion to bridge over.

The priesthood undergoes a marked change in the religion of advanced culture. In the previous stage the priests had been little more than go-betweens between men and gods. With the fuller development of religious idealism, however, their place became more truly spiritual. Not alone did they conserve the rites and doctrines of religion, but they became the censors of morals as well, and in the course of time they made the important step of giving a legalistic form to religion as distinguished from its merely ritualistic aspect. Yet side by side with the religions thus officially recognized which prevailed in Babylonia and Assyria, Egypt, Greece, and Rome, and which still prevail in China and India, there was, and is, a vast amount of religion officially unrecognized. This, expressed both in belief and custom, is regarded by the religion which is formally acknowledged as superstitious. The attitude toward it, however, is one rather of contempt than of hostility. Gradually the feeling seems to have gained ground that such a distinction between religion and superstition was distinctly injurious. More and more it became evident that religion, which was outgrowing the beliefs of animism and even of the more tenacious magic, could and must progress still further. The next step marks the transition to the religions of the last type, the highest that has thus far been evolved.

RELIGIONS COEXTENSIVE WITH LIFE. Within this class fall the religions of Judaism, Buddhism, Zoroastrianism, Mohammedanism, and Christianity, with a few minor representatives, such as Mormonism. These represent, as already stated, the conscious attempt to render religion and life coextensive, whereas the religions of primitive culture had assumed them to be one, and the religions of advanced culture had finally divorced them. They thus attempt to create final harmony between religious doctrine and religious practice. There is no longer a tacit admission of the usefulness of superstition, such as exists in the religions of advanced culture, but since everything in the spiritual world not with religion is now seen to be against it, there is a deliberate resolve to annihilate all such extra-religious forces. More than this, not alone are the lower forms of religion existing within itself regarded as hostile, but all other religions are considered as lower, and therefore to be suppressed. It is an important fact that each of the five religions in this class regards itself as true and the other four, together with all lower religions of whatever sort, as false. Herein lies one of the chief characteristics of the class. The religions coextensive with life are exclusive, all

others are inclusive. Another distinction between the two types lies in the fact that if the earlier is ethical and legalistic, the latter is spiritual. The religions coextensive with life lay more weight on the spirit of man in its relation with the divine, and less, relatively speaking, on cult and ritual. A striking example of this is seen in the origin of Buddhism, which is essentially a revolt from the excessive ritualism of Brahmanical Hinduism toward a deep spirituality with, in its pure form, almost no cult. As the maintenance of a priesthood is conditioned in a great measure by an elaborate cult, it is obvious that in this final type, conspicuous for simplicity of ritual, the priest occupies a far less important position than in the religions either of primitive or advanced culture. This affords in part the explanation of the fact that the reforms which have resulted in religions of the highest type have been made in every case by individuals outside the priestly code, by the Hebrew Prophets, by Buddha, Zoroaster, Mohammed, and Jesus. Nor is this in any way a reproach to the priest. For he is in the nature of things a conservator, not an inaugurator, and rightly so, and if in some instances he is shown by the results to have been over-cautious, he is not thereby to be convicted either of dishonesty or of ignorance. Finally, religions of this class go further than the individual or than the State, herein contrasting sharply even with the religions of advanced culture. They aspire to be world-religions, and three of them, Buddhism, Mohammedanism, and Christianity, are in fact the leading religions in numbers and extent. We have in this aspiration yet another characteristic distinction between the religions coextensive with life and all other forms of religious cult.

HISTORY OF THE STUDY OF COMPARATIVE RELIGION. The study of comparative religion is of modern origin. It is indeed true that we find in the histories of Herodotus, in the *De Iside et Osiride* of Plutarch, in the *De Dea Syria*, generally ascribed to Lucian, in the *Germania* of Tacitus, and in brief mention in numerous other classical authors accounts of religions other than Greek or Roman. Yet here, as might be expected, the historic knowledge was too slight to render the philosophical part of the work anything but superficial, although the descriptive part is still of value. The general attitude of the Greeks and Romans, who alone of the ancient world touched the subject of comparative religion, is one of contempt. This was succeeded by a not unnatural intolerance in the attitude of the Church Fathers and mediæval theologians. This attitude remained practically unchanged until the rise of skepticism in the eighteenth century. Yet there was no real progress in the study of religion, for dogmatism was succeeded by superficiality. It is noteworthy that the first real impulse to an historical study of religions came with the sixteenth and seventeenth centuries. To this early period belong such books as the *Pansœbeia, or View of All Religions in the World*, of Ross (London, 1653), and the *Ceremonies and Religious Customs of the World*, of Picart and Bernard (ib., 1733). This latter work is in a sense the forerunner of the historical method of religious study, and is far superior to one of its most important successors, the *Origine de tous les cultes ou religion universelle* of Dupuis

(Paris, 1795). The real founder of the historical school, however, was Herder, who outlined the history of religion, so far as it was then possible, in his *Ideen zur Philosophie der Geschichte der Menschheit*, published in 1781, although his previous writings indicate that many of his ideas on this subject had been formulated much earlier. The year after Herder's *Ideen* saw the publication of Meiners's *Grundriss der Geschichte aller Religionen*, followed twenty-one years later by his *Allgemeine kritische Geschichte der Religionen*. In the decade 1821-31 the foundations of a scientific philosophy of religion were laid by Hegel in his *Vorlesungen über die Philosophie der Religion* (not published, however, until 1832). The credit of inaugurating the study of comparative religion in a truly scientific spirit and method, however, must be given to Max Müller, even though his views are now in great part rejected in the light of later investigations. In a long series of volumes, including *Lectures on the Science of Religion* (London, 1872), *Natural Religion* (2d ed., ib., 1892), *Physical Religion* (ib., 1890), *Anthropological Religion* (ib., 1891), and *Theosophy or Psychological Religion* (2d ed., ib., 1899) he developed his system. He also aided in the establishment of the Hibbert Lectures on the Origin and Growth of Religion in 1878, and above all founded in 1879 the epoch-making series of translations entitled *The Sacred Books of the East*. A still greater name than Max Müller's is that of Tiele, of Leyden, whose *Outlines of the History of Religion* (translated from his Dutch *Hoofdtrekken der Godsdienstleerenschap* into English by Carpenter, London, 1877, 3d German ed. by Weber and Söderblom, Breslau, 1903) is by all odds the best general survey of religions from an historical and descriptive point of view, while his *Elements of the Science of Religion* (Edinburgh, 1897-99) and his *Geschiedenis van den Godsdienst in de oudheid tot op Alexander den Grooten* (Amsterdam, 1891-97) are no less authoritative. In France the study of comparative religion received a powerful impetus in the establishment in 1888 of the Musée Guimet. In America there is as yet little general interest in this science, although signs are not lacking that comparative religion will receive here also the attention which it merits both from a theoretical, an historical, and a practical point of view. The activity in the science, despite the lack of recognition on the part of many universities and the unfounded suspicion with which it is viewed by certain classes even of the educated, is most promising, among the eminent investigators being Réville, of France; Sausseye, of Holland; Achelis and Edmund Hardy, of Germany; Tylor and Frazer, of England; and Toy and Jastrow, of America.

BIBLIOGRAPHY. The bibliography of comparative religion is very extensive. Among general works some of the most important are, in addition to those already mentioned: Lichtenberger, *Encyclopédie des sciences religieuses* (12 vols., Paris, 1877-83); Sausseye, *Lehrbuch der Religionsgeschichte* (2d ed., Freiburg, 1897, contains also bibliographies); Orelli, *Allgemeine Religionsgeschichte* (ib., 1899); Jastrow, *The Study of Religion* (New York, 1901, contains an excellent bibliography); Tiele, *Konceptium der Religionsgeschichte* (3d German ed., Breslau, 1903, containing abundant bibliographies). For

the philosophy of religion reference may be made to Caird, *Introduction to the Philosophy of Religion* (2d ed., London, 1889); Hartmann, *Religionsphilosophie* (Leipzig, 1888); Lotze, *Grundzüge der Religionsphilosophie* (ib., 1882, Eng. trans. by Ladd, Boston, 1885); Pfeleiderer, *Philosophie und Development of Religion* (Eng. trans., Edinburgh, 1899); Sabatier, *Esquisse d'une philosophie de la religion d'après la psychologie et l'histoire* (6th ed., Paris, 1901, Eng. trans., London, 1897); Siebeck, *Lehrbuch der Religionsphilosophie* (Freiburg, 1897). As additional general manuals may be mentioned: D'Alviella, *Introduction à l'histoire générale des religions* (Brussels, 1886); Jevons, *Introduction to the History of Religion* (London, 1896); Reville, *Prologues de l'histoire des religions* (Paris, 1881, Eng. trans. by Squire, London, 1881). Special topics of importance are treated in Frazer, *Totemism* (London, 1887); id., *The Golden Bough* (2d ed., ib., 1900); Hartland, *Legend of Perses* (ib., 1894-96); Lang, *Myth, Ritual, and Religion* (2d ed., ib., 1899); id., *Myth and Religion* (ib., 1901); Taylor, *Ancient Ideals* (New York, 1896); Réville, *Les religions des peuples non civilisés* (Paris, 1883, with bibliographies); Tylor, *Primitive Culture* (2d ed., London, 1878); Roskoff, *Religionswesen der robusten Naturvölker* (Leipzig, 1880). The two most important periodicals devoted to comparative religion are the *Revue de l'histoire des religions* (Paris, 1880 et seq.), and the *Archiv für Religionswissenschaft* (Freiburg, 1898 et seq.). Discussions of individual religions not treated under special titles are contained in Réville, *Religions du Mexique, de l'Amérique centrale et du Pérou* (Paris, 1885); Abeghian, *Arménischer Volksglaube* (Leipzig, 1899); Leger, *Mythologie slave* (Paris, 1901); D'Arbois de Jubainville, *Le cercle mythologique irlandais et la mythologie celtique* (ib., 1884); Rhys, *Celtic Heathendom* (London, 1886). See also BUDDHISM; CHINESE EMPIRE, section on *Religion*; CONFUCIUS; DEMONOLOGY; DRUID; EGYPT, section on *Religion*; FETTERISM; GHOSTS; GREEK RELIGION; INDIA, section on *Ancient Religion*; JAINISM; MAGIC; MEXICAN ARCHEOLOGY; MUHAMMEDIANISM; MYTHOLOGY; NATURE WORSHIP; PERSIAN MYTHOLOGY; PERUVIAN ANTIQUITIES; PHALICISM; PRIEST; ROMAN RELIGION; SACRIFICE; SIAMANISM; SHINTO; SUPERSTITION; SWASTIKA; TABOO; TAOISM; SCANDINAVIAN AND TEUTONIC MYTHOLOGY; TOFEMISM; ZORASTRIANISM; and the bibliographies and cross-references under these titles.

RELIGIOUS EDUCATION. See SCHOOLS.

RELIGIOUS ORDERS. See ORDERS; MONASTICISM.

RELIGIOUS SOCIETIES. In a legal sense, those corporations formed for the advancement of religion or the administration of church property for religious purposes. To the efforts of religious corporations in the Middle Ages to acquire vast holdings of land was due the enactment of the various Statutes of Mortmain (q.v.). Most of the States of the United States now have general laws governing the formation of religious corporations and defining their powers. Generally there is no limit to their power of acquiring land for church purposes and all their property used directly for church or religious purposes is exempt from taxation. See COR-

PORATION; CANON LAW; and compare CIVIL CHURCH LAW and CLUB.

RELIQUARY (ML., *reliquare, reliquarium*, from Lat. *reliquia*, remains). A case or box to contain relics. Reliquaries are made of all kinds of materials, such as wood, iron, stone, ivory, silver, enamel, gold, and crystal, and are frequently ornamented with costly jewels. Shrines are of the same description, but are on a larger scale and are permanent. As a class they are the most consummate masterpieces of mediæval minor artists, especially among the metal-workers. Some of the cathedral and church treasuries still possess numerous mediæval reliquaries, for example, San Marco at Venice, and the cathedrals of Aix-la-Chapelle and Cologne. The reliquary in the form of a church at the Cathedral of Orvieto is one of the most wonderful pieces of thirteenth-century goldsmith work, with exquisite details. The Romanesque and Gothic periods were the golden age of such work (eleventh to fifteenth centuries). At first the Rhemish and Flemish schools were easily pre-eminent, but in the thirteenth century Italy and France surpassed the northern schools. Reliquaries were of many shapes. They often took the form of the relic they contained, such as a hand, a foot, or a head. They were nearly always decorated with minute figures in relief or even statuettes, or with colored enamels and ornamental designs. The Renaissance led to a complete decadence.

RELIGUES OF ANCIENT ENGLISH POETRY. A collection of old ballads and lyrics (1765), taken by Thomas Percy from an old manuscript of the early seventeenth century, which he found at a friend's house in Shiffnal, Shropshire. These ballads he altered and polished to suit the taste of his age, for which he was severely criticised. Ritson charged Percy with forged and garbled versions of many ballads, and even questioned the existence of the manuscript. This, however, was proved by an edition from the original in 1868 by Hales and Furnivall. In spite of Percy's inaccurate and unscholarly work, the *Reliques* has been a source of pleasure for generations and marks the revival of taste for romantic poetry.

REL'LY, JAMES (c.1722-78). A Universalist minister. He was born at Jeffreston, Pembroke-shire, Wales, was converted under Whitefield in 1741, and became an itinerant Methodist preacher. Being convinced that Universalism was true, he parted company with the Methodists, and preached independently in various places. In 1761 he settled in London and preached there, without much success. It was, however, under him that John Murray (q.v.), the Apostle of Universalism in the United States, was converted.

REMAINDER (OF, *remanere, remain*, from Lat. *remanere, to remain*, from *re, back* + *manere, to stay*). The fee tail, the life estate, and the term of years are conceived of as being less in quantity than a fee simple (see ESTATE), and the gift of such an estate leaves something—some part of the fee simple—undisposed of, which may remain, or revert back, to the grantor (in which case it is called a *reversion*), or may be given by the same deed which creates the lesser estate to a third person as a *remainder*. There may, indeed, be any number of remainders, one

after the other, until the entire fee simple has been disposed of, as, for example, after a present, or 'particular,' estate to A for life, remainder to B for life, remainder to C for life, remainder to D in fee tail, leaving still a fee simple to be given to E as a final remainder, or to come back to the grantor as a reversion. A remainder thus given to an ascertained person, ready to go into effect upon the determination of the precedent estate, is said to be *vested*. If given to an unborn or unascertained person, or upon a further contingency (as, when B shall return from abroad), it is a *contingent* remainder. Such a remainder was at common law scarcely of sufficient importance to be regarded as an estate at all. It was incapable of alienation to a stranger and was liable to be extinguished by the accidental or deliberate determination of the precedent estate before the contingency had happened on which the remainder was to vest. But modern legislation has given the contingent remainder much of the definiteness and permanence of the vested remainder by freeing it from this dependence upon the precedent estate.

Though classified as a future estate, a remainder is conceived of as a present interest and as capable of being dealt with as such by the owner thereof. It may thus be alienated like any other property (though, being 'incorporeal,' it has always required a deed of grant to convey it), and, being real property, it will, if a remainder in fee, descend to the heirs of the owner. Although efforts have been made in some of the United States to wipe out by legislation the distinction between remainders and other future estates, these have not completely succeeded, and the distinction is still of fundamental importance in this country as well as in England. See **ESTATE; FUTURE ESTATE; PROPERTY**.

Consult: Digby, *History of the Law of Real Property* (Oxford, 1875); Fearn, *The Law of Remainders*; Leake, *Law of Property in Land* (London, 1874); Blackstone and Kent, *Commentaries*.

REMAINDER THEOREM. An algebraic principle of great service in factoring. The theorem may be stated thus: If $f(x)$ is a rational integral algebraic function of x , then the remainder arising from dividing $f(x)$ by $x - a$ is $f(a)$. Since the dividend equals the product of the quotient and the divisor plus the remainder, we have $f(x) = q(x - a) + r$, and if $x = a$, the equation becomes $f(a) = r$. Similarly the remainder arising from dividing $f(x)$ by $x + a$ is $f(-a)$. When the remainder is zero the division is exact, hence the divisor is a factor of the given function. E.g. $x^n + y^n$ is divisible by $x + y$ when n is odd, since the remainder $(-y^n + y^n) = 0$. The rational binomial factors of functions above the second degree are readily determined by use of the remainder theorem and synthetic division. E.g. to factor $a^3 - 6a^2 + 11a - 6$, it is only necessary to substitute, for a , factors of the absolute term -6 . Using detached coefficients (see **COEFFICIENT**), the division by $a - 1$ may be performed thus:

$$\begin{array}{r} 1 - 6 + 11 - 6 \\ 1 - 1 \quad 5 \quad 6 \\ \hline 1 - 5 + 6; 0 \end{array}$$

Whence the factors are $(a - 1)(a^2 - 5a + 6)$ or $(a - 1)(a - 2)(a - 3)$.

REMAK, ra'mak, Roum. 1815-65. A young one of German physiologist and embryologist, born at Posen. He studied at Berlin; in 1847 was privat-docent at Berlin, and was elected professor extraordinary in 1859. Besides important work on the physiology of the nerves, he, with Kölliker, further elaborated the germ-layer theory. His chief embryological work was *Untersuchung über die Entwicklung der Wirbeltiere* (1851-53).

REMBRANDT, rem'brant, properly REMBRANDT HARMENSZ VAN RIJN, ha'm'nens van rin (1606-69). The chief master in painting and etching of the Dutch school. The date of his birth is disputed, the most probable conclusion being that he was born at Leyden, July 15, 1606. His father, Harmen Gerrit-z van Rijn, a well-to-do miller, sent him to a Latin school, preparatory to the university, but finally permitted him to follow his inclinations to painting. After studying with his relative, Jacob van Swanenburgh, at Leyden, he was for six months a pupil of Pieter Lastmann at Amsterdam, from whom he learned the technique of etching, and whose influence was decisive upon his art. He was a very precocious genius, and upon his return to Leyden he soon acquired a high reputation. About 1631 he removed to Amsterdam, where he speedily became the most fashionable portrait painter, and had many pupils. Among his patrons were Frederick William, the Prince of Orange, and Burgomaster Jan Six; the foremost men of the day, like the poet Jeremiah Decker and Constantin Huygens, were his friends and associates. He bought a fine house in the Breestraat, which he equipped with quaint costumes, weapons, and the like, and which contained his remarkable art collection, especially rich in old Netherlandish prints. He possessed paintings of Giorgione, Raphael, Michelangelo, and even antique sculptures.

A very important event in Rembrandt's life was his marriage in 1634 with Saskia Uylenburgh, a young lady of wealthy and influential Amsterdam family. Their happy married life was the inspiration of many of his best works. After her death in 1642, he drew back even more from the world, especially after his financial misfortunes, which censorious biographers have ascribed to dissipation and extravagance. But although it is true that he expended a large sum upon his art collection, his misfortunes are rather to be ascribed to the hard times then prevailing in Holland, and to the change in public taste. In 1657 his creditors sold his wonderful collection, including several of his own paintings, for the pitiful sum of 5000 florins, and in 1658 his house for 11,000. But Titus, Saskia's son, and Hendrickje Stoffels (or Jaghers), a young woman who had become his house-keeper in 1649, formed a partnership for the disposal of Rembrandt's pictures, and rented a house in the Rozengracht, paying the artist a stated yearly salary. After ten years of toil the odd artist satisfied his creditors. The stories of his dissipation and low associates in later life are unfounded. His chief associates were artists and he was interested in the inhabitants of the Ghetto; but he also had more influential friends, like Jan Six, Hendrickje died in 1664, leaving a daughter Cornelia, and Titus in 1668, Rembrandt himself was buried in the Westerkerk, Amsterdam, on October 8, 1669.

The world has never produced a more original artist than Rembrandt. In theory and in practice he was the great antipode of what was considered the standard art of his day—the Italian. He knew no model, except nature. His conception of nature was essentially poetic and picturesque, but at the same time virile. The most prominent technical characteristic of his work is a marvelous rendition of light, through which he emphasized the important part, leaving the rest in luminous shadows. At first he painted in full light, but after 1633 he preferred the inclosed light of the studio. Everything appears in subtle harmonies of gold and brown. His early pictures are painted with detailed execution and light color; but he increasingly uses a broader brush and richer color, and later in life his painting becomes highly impasto, almost decorative in character. He exercised great influence upon the art of his day, and a more lasting one upon the art of the nineteenth century. Among his many pupils were Gerard Dou, Govaert Flinck, and Ferdinand Bol.

Rembrandt was preëminent in portraiture, and no artist has succeeded better in rendering the head in a realistic, characteristic, and at the same time in a picturesque manner. Among his numerous portraits, perhaps the most interesting are those of himself and of his wife, Saskia. A charming picture is that of the young couple in an affectionate position at breakfast. The best known examples of Rembrandt's portraits are those of 1633, 1634, and 1637 in the Louvre; of 1635 in the Liechtenstein Gallery, Vienna, and in the National Gallery, London; of 1641 in Buckingham Palace. In later life he painted those in Munich (1658), National Gallery (London), and several in English private possession. The best known portraits of Saskia are at Dresden and Cassel; of Hendrickje Stoffels at Berlin; of his mother in Windsor Castle; of his son Titus and of his sister in the Imperial and Liechtenstein galleries, Vienna. Among other famous portraits are: a "Money Changer" (1627, Berlin); the "Polish Nobleman" (1631, Saint Petersburg); the poet Kint (1633, Cassel); the "Mennonite Preacher Amslow Consoling a Woman" (Berlin Museum); the so-called "Frame-Maker" (Haymeyer Collection, New York, 1640); "Burgomaster Pancras and His Wife" (1645, Buckingham Palace); "Jan Six" (1654, Amsterdam); the "Ship Architect and His Wife" (in possession of the King of England); the so-called "Jewish Bride" (Amsterdam); and the "Architect" (1656, Cassel). Of his "Rabbis" a fine example is in Buckingham Palace; of his numerous "Old Women," the best known are in London and Saint Petersburg. Examples of his work may be seen in this country in the Metropolitan Museum, New York.

Rembrandt's most ambitious efforts in portraiture were groups similar in character to those of Hals. The masterpiece of his earlier full-light treatment is the well-known "Anatomical Lecture" (1632, The Hague). It represents the anatomist Nicholas Tulp, who ordered the picture, making a post-mortem examination before a group of his associates. The heads are wonderfully expressive, and the dead body is treated in a manner at once realistic and delicate. On a still larger scale is his masterpiece of the second period, painted for the Town Hall and now in

the Amsterdam Museum. The fine treatment of chiaroscuro created the erroneous opinion that it represented a "Night Watch," by which title it is generally known, but it is, in reality, a portion of the civic guard issuing forth in broad daylight. His third chief work of this character is "De Stallmeesters" (1662), a representation of the presidents of the clothiers' guild, in the same museum—simple and harmonious in treatment, and showing the more sombre coloring of his last period.

Like the Italians of the fifteenth century, Rembrandt depicted religious subjects in apparel of the day, and chose especially the inhabitants of the Ghetto in their picturesque Oriental costumes. They are characterized by high dramatic power, and by deep religious feeling, of that homely and effective kind typical of the Dutch Calvinistic Church. Among the principal examples are the "Presentation of Christ in the Temple" (1631, The Hague); the "Descent from the Cross" (1633, Munich); "Samson Threatening His Step-Father" (1635, Berlin); the "Angel Leaving Tobias" (1637, Louvre); "Samson's Wedding" (1638, Dresden); the "Sacrifice of Manoa" (1641, ib.); "Reconciliation of Jacob and Esau" (1642, Louvre); "The Disciples of Emmaus" (1648, Louvre); "Jacob Blessing His Grandsons" (1656, Cassel); and "Return of the Prodigal Son" (Saint Petersburg). His mythological pictures make no endeavor to attain classic form or beauty, but strive for pure pictorial effects. Some of them, like the "Rape of Ganymede" (Dresden), even seem to burlesque the subjects. More serious examples are "Diana and Endymion" (Liechtenstein Gallery, Vienna); the "Rape of Proserpina" (Berlin); and "Danaë" (Saint Petersburg). The dozen landscapes which Rembrandt painted display the same poetic feeling and technical skill as his figure subjects. With emphasis of the essentials he has portrayed the beauty of the flat country about Amsterdam. The best known example is "The Mill," in possession of Lord Lansdowne (London); other examples are at Brunswick, Cassel, Dublin, etc.

Rembrandt was probably the most consummate etcher of all times, and held his rank on purely technical as well as artistic grounds. His etchings possess the harmony, tone, and poetry of his pictures, and whether sketched or highly finished they are always masterpieces. Among his best known prints are the "Descent from the Cross" (1637); "Christ Healing the Sick"; "Christ Preaching"; "Burgomaster Jan Six"; and the well-known "Landscape with Three Trees." Examples of his prints, as well as of his admirable drawings, may be found in the Louvre, Albertina (Vienna), and British Museum, in the museums of Berlin, Dresden, Munich, Holland, and in several private collections.

BIBLIOGRAPHY. Consult the biographies by Scheltema (Amsterdam, 1853); Vosmaer (Paris, 1877), the standard authority; Lemecke, in *Dohme: Kunst und Künstler* (Leipzig, 1877); Grahl (ib., 1892); Michel (Paris, 1893); Knackfuss (Bielefeld, 1899); Malcolm Bell (London, 1899); Neumann (Stuttgart, 1900). (Berlin and London, 1888-90, 1902); and for reproductions of all his works, Bode (8 vols., Paris, 1897).

REMBRANDT
"THE SYNDICS OF THE DRAPERS," FROM THE PAINTING IN THE RYKS MUSEUM, AMSTERDAM

REMEDIOS, rē-má'dé-ós, or SAN JUAN DE LOS REMEDIOS. A town in the Province of Santa Clara, Cuba. It is situated 30 miles northeast of Santa Clara, and 5 miles from the port of Caibarién, with which it is connected by rail, as it is with all the important towns of the island (Map: Cuba, F 4). Population, in 1899, 6633.

REMEDY (from Lat. *remedium*, cure, from *re*, back again, anew + *mederi*, A. *mad*, to heal). In law, the means by which the violation or invasion of a legal right is either prevented, redressed, or compensated. The term in fact is the correlative of the term legal right, there being in general no right without a corresponding remedy for its violation. The term remedy, however, does not include punishment, and therefore has no application in the criminal law.

The various forms of remedy afforded by the law may be classified as: (1) Remedy by act of the injured party, or self-help; (2) remedy by operation of law; (3) remedy by action or suit.

(1) Remedy by the act of the injured party includes all those rights conferred by law on private persons to protect themselves or their property from injury, and in certain cases to redress wrongs done, without recourse to legal proceedings. In general, remedy by act of the party, or self-help, is permitted by law whenever the remedy afforded by action would be less effective and when the privilege thus accorded to the individual to take the law into his own hands is not inconsistent with sound public policy. Thus, in general, one may defend his person and property from unlawful attacks provided he use no more force than is necessary to accomplish that result. (See SELF-DEFENSE.) One who has been unlawfully deprived of his property may upon fresh pursuit forcibly retake the property, but if the pursuit is not made immediately following the wrongful taking, or if the property has passed into the hands of an innocent holder, his only remedy is by action to recover the property or damages for its conversion. Other forms of remedy by act of the injured party are distress, right of entry, and abatement of a nuisance.

(2) There is perhaps but a single true example of remedy by operation of law, and that is the ancient doctrine of *remitter*, which may briefly be stated as follows: At common law one who was dispossessed of his real estate under certain circumstances had a mere right of action to recover his property; he had no right to reënter upon the property and thus acquire possession, his sole remedy being by action. If, however, he became entitled to the property by inheritance or purchase through the person wrongfully in possession, he was entitled to possession of the property, and upon taking possession under his new but defective title, he might then retain possession by virtue of his valid title. He was then said to be remitted to his rights under the valid title. The doctrine is of slight importance in modern practice.

(3) Remedy by action is the relief or redress afforded to one whose legal right has been invaded, by means of a legal proceeding carried on in a court having jurisdiction over the subject of the suit and the parties to it. See PROCEDURE and ACTION.

For the discussion of the varied forms of remedies, see such titles as DISTRESS; FORCIBLE ENTRY and DETAINER; NUISANCE; EQUITY; CRAN-

CLBY; COMMON LAW, etc., and consult the authorities referred to under some of these titles.

REMEDY OF LOVE, IHL. (1) A poem of the sixteenth century wrongly ascribed to Chaucer, and printed in the edition of 1532. (2) A paraphrase of Ovid's *Remedy of Love* by Sir Thomas Overbury, printed in 1620.

REM'ENSnyder, JUNIUS BENJAMIN (1843—). An American Lutheran (General Synod) clergyman, born in Staunton, Va., and educated at Pennsylvania College, Gettysburg (class of 1861), and at Gettysburg Theological Seminary (1865). He held pastoral charges in Philadelphia, in Savannah, Ga., and in New York City; labored for the union of Lutheran sects, which was largely accomplished through his service, and published *Doom Eternal* (1880), *Luther, His Work and Personality* (1883), *Six Days of Creation* (1886), and a *Lutheran Manual* (1892), which came into common use.

REMÉNYI, rē'mán-yé, EDUARD (1830-98). An Hungarian violin virtuoso. He was born at Heves, and studied the violin under Joseph Böhm at the Vienna Conservatory, 1842 to 1845. He took part in the insurrection against Austria in 1848 and fled from Hungary. He came to the United States in 1849, but in 1853 went to Weimar, and thence to England, where he was appointed solo violinist to Queen Victoria. In 1860 he was pardoned by the Austrian Government and returned to Hungary. He afterwards traveled extensively and visited Canada, Mexico, China, Japan, France, and Germany. He ranked among the foremost musical artists of his day, although his style was frequently so exaggerated as to mar the high standard of his work. In technique he has had few rivals. He died while on an American concert tour.

REMI. A powerful people of Belgic Gaul, who alone of the Belgæ formed an alliance with Cæsar in his campaign of B.C. 57. Their capital became the modern Rheims.

REMIGIUS, rē-mij'i-ús. See REMY.

REM'INGTON, FREDERIC (1861—). An American sculptor, artist, and author, born at Canton, N. Y. He was educated at the Vermont Episcopal Institute, the Yale Art School, and the Art Students' League, New York City. Afterwards he lived on a ranch in the West. His pictures of Western subjects, especially cowboys and soldiers, soon became very popular. His statuettes include "The Broncho Buster" and "The Wounded Bunkie." They are spirited bronzes, executed with much technical skill, and his horses are notably fine. His stories also deal with Western life, and are illustrated by him-self. They include *Pony Tracks* (1895), *Crooked Trails* (1898), and *Sundown Lullary* (1899).

REMINGTON, PHILIP (1816-89). An American manufacturer and inventor, born at Litchfield, N. Y. He studied at the Cazenovia Seminary and then entered his father's arms factory at Ilion, N. Y. During the Civil War the Remingtons supplied small arms to the Federal Government, and at its close they formed a corporation under the title E. Remington & Sons. Soon afterwards they began to manufacture the breech-loading rifle which bears their name. In 1871 the firm secured the right to one of the first typewriters, but subsequently the manufacture both

of cooperators and of rifles passed into other hands.

REMIREMONT, *remi-rânô*? A town in the Department of Vosges, France, on the left bank of the Moselle. (Map: France, N 31.) The residence building of the old abbey has been rebuilt and is now used as the hôtel de ville. There is a trade in Vosges cheese. Cotton goods, embroideries, and ironware are manufactured. Population, in 1901, 10,322.

REMITTENT FEVER (from Lat. *remittens*, pres. part. of *remittere*, to send back, from *re*, back again, anew + *mittere*, to send). A form of malarial fever characterized by a regular lowering of the temperature, which, however, always remains above the normal point. In this respect it differs from intermittent malaria, in which there is an interval of entire absence of fever (apyrexia); and from the continuous variety, in which the body heat remains continuously elevated. The causative agent in remittent fever is the estivo-autumnal variety of the *plasmodium malariae* of Laveran. (See MALARIA.) The severer forms of remittent fever prevail in the Southern States and in tropical countries. They are found in Southern Asia, Western Africa, Central America, and the West Indies. The disease is sometimes, though improperly, called bilious remittent fever. The symptoms of this type are very severe and characterized by typhoid or cachectic features such as occur in the worst cases of intermittent fever, viz. coma, delirium, vomiting, collapse, and hemorrhages from various parts of the body. In certain localities cases occur in which hamoglobinuria (the presence of altered blood in the urine) is a prominent symptom. The urine assumes a port-wine color, or becomes almost black, the patient is jaundiced, and in fatal cases death takes place from suppression of urine with coma, or from collapse or syncope.

A milder type of remittent fever is seen in temperate climates, especially in the late summer and fall. The symptoms are much less pronounced than those of typical intermittent fever, and consist of loss of appetite, nausea, chill, slight jaundice, and a colorless diarrhoea. The chill is not severe and may appear only once in the course of an attack, which lasts from a few days to two or three weeks. The temperature is not unlike that of a mild typhoid fever (q.v.), and the disease is not infrequently mistaken for typhoid.

The treatment of remittent fever is the same as that of other forms of malarial fever. Quinine in doses proportioned to the severity of the attack acts as a specific. Tonics must also be given and attention paid to the general health. See INTERMITTENT FEVER.

REMONSTRANTS. See ARMINIANISM.

REMORA (Neo-Lat., from Lat. *remora*, delay, from *re*, back again, anew + *morare*, delay), or SUCKING FISH. A fish of the family Echeneididae, interesting because of its commensal habit. The remoras attach themselves to sharks and other large fishes by a sucking-disk on the top of the head. They have an elongated body, covered with very small scales; one soft-rayed dorsal fin, situated above the anal fin; the head flattened and covered with an elongated disk extending back beyond it, which exhibits numer-

ous transverse cartilaginous laminae directed backward, and has a free flexible broad margin. These laminae are formed by modification of the spinous processes of a first dorsal fin, and when

THE WEST INDIAN REMORA (*Rhombochirus osteochir*).

they are raised after the margin of the disk has been closely applied to a smooth surface, a vacuum is created; and so powerful is this apparatus that great weights may be dragged by a remora, while it obstinately refuses to let go its hold. A remora thus attached to a shark or turtle may be carried about for weeks, leaving its host only to secure food, injuring the shark in no way save, perhaps, by the slight check its presence gives to the shark's speed in swimming. In Madagascar native turtle-catchers put a ring about the narrow caudal end of the remora's body, attach a line to this ring, and thus use the fish for catching turtles. Several species of the family are known, dwelling in all the warmer seas. They are mostly small fishes, one or two feet in length, and of plain colors, or striped lengthwise in brown and white. One (*Remora brachyptera*) is occasionally caught as far north as Cape Cod. A rarer form is *Rhombochirus osteochir*, which attaches itself to spearfishes (Tetrapturus). More numerous is the closely related species called 'shark-sucker' (*Echeneis naucrates*). (See SHARK-SUCKER.) Consult Jordan and Evermann, *Fishes of North and Middle America* (Washington, 1898).

SUCKING-DISK OF A REMORA.

REMPHAN. A word which occurs in Aets vii. 43 in a passage quoted from the Septuagint text of Amos v. 26. In Amos the reading is Chium, which is evidently intended either as the name of a heathen deity or as a symbol of idolatrous worship, and is generally explained as the Babylonian name of the planet Saturn (see CHU'X). Why Remphan (Raiphon, Rephan in some texts) should be substituted in the Septuagint is hard to explain. The attempt to connect it with an Egyptian name for Saturn is not satisfactory. A plausible suggestion is that it represents a misreading or alteration of the Hebrew.

REMSCHIED, *rēm'shit*. A city in the Rhine Province, Prussia, 19 miles northeast of Cologne (Map: Prussia, B 3). It has several fine technical schools. Remscheid's manufactures are mainly small steel and iron wares (tools, scythes, skates, etc.), in which industry it ranks first in Germany. There are also machine shops, rolling mills, and manufactures of silk ribbons. The city carries on a large export trade chiefly with America, Russia, and the Orient. Remscheid is first mentioned in 1132. Its industries were stimulated by Protestant refugees from Holland and France. Population (commune), in 1890, 40,371; in 1900, 58,108.

REMSEN, IRA (1846—). An American chemist, born in New York City. He graduated from the College of the City of New York in 1865, from the College of Physicians and Surgeons, New York, in 1867, and received his Ph.D. from the University of Göttingen, Germany, in 1870. From 1870 to 1872 he was assistant in chemistry at the universities of Tübingen, Munich, and Göttingen, Germany; and from 1872 to 1876, professor of chemistry and physics in Williams College. In 1876 he was made professor of chemistry in Johns Hopkins University, and in 1901 succeeded Dr. Gilman as president of the university. Dr. Renssen has carried out a number of important investigations in both inorganic and organic chemistry. He is editor of the *American Chemical Journal*, founded by him in 1879. His book-form publications include the *Principles of Theoretical Chemistry* (4th ed. 1892); *Organic Chemistry* (latest edition 1899); *Introduction to the Study of Chemistry* (1885); and the *Elements of Chemistry* (1887). Renssen's text-books have passed through many editions in this country and have been republished in England and translated into several foreign languages. They form a remarkably clear exposition of the fundamental principles of the science and are well known among students of chemistry both in this country and abroad.

REMUS. The brother of Romulus and co-founder of Rome.

REMUS, UNCLE. A character invented by Joel Chandler Harris in *Uncle Remus; His Songs and Sayings* (1880), and other stories. He is an old plantation dandy, who entertains the son of his mistress with quaint stories of the doings of Bre'r Fox, Bre'r Rabbit, and other animals, illustrating their various traits and interspersed with shrewd philosophy. The author used the folk tales current among negroes in the southern part of the United States, and several of his stories aroused the curiosity of those interested in folklore.

RÉMUSAT, rā'mu'zā', CHARLES FRANÇOIS MARIE, Count de (1797-1875). A French politician and philosophic historian, born March 14, 1797, in Paris. He was the son of Claire Elisabeth Jeanne Rémusat (q.v.). Rémusat studied with brilliant success, and in 1818 began his career as a journalist and supporter of Guizot. He contributed constantly to *Le Globe* from its establishment in 1824. From 1830 to 1848 he was Deputy, and for brief periods Under-Secretary of State (1836) and Minister of the Interior (1840). After the revolution of February, 1848, he was elected to the Constituent and Legislative Assemblies, and became an opponent of Louis-Napoleon, by whom he was exiled after the coup d'état. He was amnestied in 1859 and devoted himself to literature and science. From 1871 to 1873 he was Minister of Foreign Affairs. The most noteworthy of his writings are *Essais de philosophie* (1842), *Abélard* (1845), *Passé et présent* (1847), *L'Angleterre au XVIII. siècle* (1856), *Bacon* (1858), *Hartley* (1874), *Histoire de la philosophie en Angleterre depuis Bacon jusqu'à Locke* (1875). After his death were published six volumes of *Correspondance pendant les premières années de la Restauration* (1883-90).

RÉMUSAT, CLAIRE ELISABETH JEANNE GRAVIER DE VERGEMES, Countess de (1780-1821). A writer of memoirs, born in Paris. She was a

grand-niece of Vergemes, Prime Minister under Louis XVI., a noted beauty of the Court of Napoleon I., and an intimate friend of Josephine. As wife of Count Augustin Laurent de Rémusat, chamberlain of Napoleon, and as *dame de palais*, she was acquainted with the intimate life of the Napoleonic Court, of which she left an account in her *Memoires*, published long after her death (1879). She was also the author of an *Essai sur l'éducation des femmes* (1824).

RÉMUSAT, JEAN PIERRE, ABE (1788-1832). A French Orientalist, born in Paris; the son of a surgeon. His father taught him Latin, which he wrote and spoke with great ease. He took up Chinese and unaided brought out in 1811 his *Essai sur la langue et la littérature chinoises*. He received his degree as a physician at twenty-five, and served in the military hospitals. A chair of Chinese having been established at the Collège de France in 1811, Rémusat was appointed to it. He was made a member of the Academy in 1816, and in 1818 succeeded Visconti as editor of the *Journal des Savants*. He was one of the principal founders of the Société Asiatique of Paris in 1822, and was long its secretary. He translated and wrote a good deal, many of his shorter productions appearing in the *Moniteur* and other periodicals, as well as in the *Journal of the Asiatic Society*. He died of cholera in Paris. His principal works are: *Livre des recompenses et des peines* (the Chinese *Kan-ying-pan*), with notes and illustrations (Paris, 1816); *L'invariable milieu de Ts'z-tse* (1817); *Description du royaume de Camboge* (1819); *Histoire de la ville de Khotan*, to which is appended a treatise in which he endeavors to show that jade is the jaspis of the ancients (1820); *Éléments de la grammaire chinoise* (1822); *Mémoire sur la vie et les opinions de Lao-tse* (1823); *Mélanges asiatiques* (1825); *Tu-Kiao-li*, or "The Two Cousins" (1826); *Recherches sur les langues tartares* (1829); *Nouveaux mélanges asiatiques* (1829); and *Foi Koué K'i, ou relations des royaumes bouddiques* (a translation of the travels of the Buddhist pilgrim Fa-hien, unfinished at the time of his death, but revised, completed, and supplemented by Klaproth and Landresse, and brought out in 1836). Consult Silvestre de Sacy, *Notice sur la vie et les ouvrages de Rémusat* (Paris, 1834).

RÉMY, rā'mé', CAROLINE (1855—). A French journalist, best known by her pseudonym of Séverine. She was born in Paris, and in 1880 met in Brussels the communiard Jules Vallès, with whom she wrote for Paris papers, and, after 1883, for his *Cri du Peuple*. On Vallès's death Mlle. Rémy married Guébard, a co-editor of the *Cri du Peuple*, which for several years was carried on under her supervision, in the meantime turning from socialism to philanthropic sentimentalism. Besides she appealed for many charities in the columns of the *Figaro*, *Gil Blas*, *Gaulois*, and *Petit Journal*. In the nineties she made herself famous by publishing an interview with Leo XIII., and in 1896 by a bitter personal warfare with Rochefort.

REMY, or REMI, SAINT. (1) The apostle of the Franks (437-c.533). He was born of noble family at Leon. He was appointed in 459, against his will, to the Bishopric of Rheims, and his episcopate is memorable for the conversion

of Clovis, who was baptized by Remy on December 24, 496. Remy lived to see Gaul almost entirely Christianized, and died in 532 or 533. Some of his letters are preserved in Migne, *Patrologia Latina*, lxx., as also two documents under the title of *Testamenta*, the genuineness of which has been disputed. Consult his *Life*, by Aubert (Paris, 1849). (2) An Archbishop of Lyons (833-875), who sided with Gottschalk (q.v.) and whose works are in Migne, *Patrologia Latina*, cxxi. (3) A Benedictine monk, head of the episcopal school at Rheims (882-908), whose works, which are commentaries and an allegorical interpretation of the mass, are in Migne, *Patrologia Latina*, cxxxi.

RENAISSANCE (Fr., new birth), or REVIVAL OF LEARNING. A name usually applied to the transition from mediæval to modern methods of study and thought. As to its origin and the time at which this is to be set, literature is full of mis-information. The most common error, still repeated in text-books, is that through the capture of Constantinople by the Turks in 1453 Greek manuscripts and Greek scholars were brought into Europe in such numbers that a complete revolution in the intellectual life was thereby and at once produced. This notion takes no account of the condition of European culture which must have existed to make such a reception possible. In fact, the revival of interest in learning for its own sake followed a long and natural process. It is clearly discernible more than a century before the capture of Constantinople, and by that time had completely established itself in Italy and made great progress in other countries. The actual importation of manuscripts and teachers, doubtless stimulated by this event, had long been going on, and it had already become an established custom for Western youths to seek in Athens or in Constantinople satisfaction for the intellectual curiosity aroused by their studies at home.

It is again a popular error to suppose that we can reach a clear understanding of the great transition by undervaluing the culture of the Middle Ages. The difference is not merely or primarily in the mental power of individuals nor in the volume or range of their learning. It is in the spirit in which they approached the study of the past and applied it to the conditions of the present. Mediæval learning had been pursued almost entirely by clergymen and had been valued chiefly for its service in making clear to the increasing mental acuteness of the West the mysteries of the faith. During this period the European mind had lain under the spell of the philosophy of Realism, with its inevitable indifference to the phenomena of everyday experience and its contempt for the idea of the individual as compared with the authority of traditional institutions. With the beginning of the fourteenth century a reaction makes itself clearly felt. A new philosophy, that of Nominalism, finds expression in the Englishman William of Ockham and becomes a vital force in the political theories of Marsiglio of Padua and his school. The essence of this new way of looking at things is the importance of the individual, and hence his right to think and organize as may seem best to him. In religious affairs we see the application of this principle in the fearless criticism of the prevailing conditions by Wiclif in Eng-

land, Huss in Bohemia, and all their sympathizers, organized or not, throughout Europe. This central idea is that the most important fact of Christianity is the membership of the individual Christian in a community of which Christ alone is the head, and that consequently all organized forms of human authority in religion are non-essential and may be totally wrong. The only necessary authority is that of Scripture, and the inevitable result of this is the right of individual interpretation with all its consequences. From Wiclif on through the whole period of the Reformation, the Bible is the common source of appeal for the most diverse forms of opposition to the Roman system. Naturally men found in its infinite variety a thousand serviceable things that were not there.

Precisely parallel with this development in religion is the intellectual process we call the Revival of Learning. Wiclif's Italian contemporary Petrarca subjected to a sweeping criticism all the existing forms of the science of his day: the scholastic philosophy, the science of astrology, the study of the law and of medicine, the practice of teaching, all seemed to him to be governed by a set of conventional rules having no foundation in fact. To this mass of tradition Petrarca opposed the principle of individual study and observation of things as they were. Yet, he, too, like the religious reformers, must have his authority, and he found it in the classic literature. The 'ancients' stood to him for types of a higher manhood, with larger, freer, and truer conceptions of life. They seemed to him free from the superstitious slavery to traditions which he saw around him. His own struggling individualism found its justification in what he imagined to be the perfected individualism of the ancient world. His own poetic gift found its chief satisfaction in the poetic charm of ancient literature; even the prose of Cicero seemed to him to have a wonderful rhythm long before he could understand it. Then, precisely as the religious reformers insisted that the Bible should be studied without restraint of doctrine or tradition, so Petrarca found his chief mission in collecting, collating, copying, and publishing the texts of the classical authors. Still further, as the translations of Wiclif and others were made, not from the original tongues, but from the imperfect Latin authorized version (Vulgate), so Petrarca had to be content with Latin versions of the Greek authors. In both cases the authority they revered came to men in an imperfect form, but in both the spirit of a new time is perfectly evident. Wiclif is the first apostle of the Protestant Reformation, and Petrarca is the first great teacher of the Revival of Learning. To conclude, the Humanist was as much inclined to discover non-existent things in his classics as was ever the Reformer in his Bible.

Petrarca was at once the defender of rational thought, and, after Dante, the chief creator of the modern Italian language. The literary use of the modern tongues, the natural utterance of the free layman, is, equally with the more sympathetic study of the ancient world, an element in the great reaction against a purely clerical and Latinized culture.

This double intellectual life of Petrarca is shared by all his humanistic contemporaries and

immediate followers. Giovanni Boccaccio is known to posterity chiefly through his Italian prose tales, but his own special pride was in the service he rendered to classical learning by his laborious encyclopedic works—the *Genealogy of the Gods*, a dictionary of mythology, and his *Dictionary of Classical Geography*. These books served as a groundwork of classical studies for the youth of two centuries to come. Boccaccio died as professor of the *Divine Comedy* at the University of Florence, another illustration of the equality of the modern and ancient literatures in the estimation of Renaissance Italy.

Petrarca applied to learning for the first time what we have learned to call the 'collector's instinct.' Much of the classic literature was already known, but until Petrarca no one had thought of searching for more. Through his widely extended personal relations in all the countries of Europe he was able to employ willing hands to bring the long-forgotten manuscripts out of their hiding-places, to have them sent to him, procure copies of them, compare these with the originals, and thus learn wherein they needed correction. Many indications in already known writings pointed to others not yet discovered, and thus made possible intelligent search after these lost treasures. All this work was carried on by Petrarca and his contemporaries with the fresh enthusiasm that belongs only to an interest freed from any professional quality, but it soon became the serious pursuit of men who gave their lives to it, and thus laid the foundations for a new profession, unknown to the Middle Ages, the profession of the scholar, pure and simple. These men were devoted to learning for its own sake, and ready to leave to others the application to practical things.

The same instinct of discovery appears also in the field of archaeology. The Middle Ages had pitilessly despoiled the remains of ancient buildings to gain material for their own constructions, and had destroyed without scruple the choicest works of antique sculpture. Now, following the indications of what remained above ground, Petrarca and his followers began to seek for what was hidden. They gave the first feeble impulse to the vast activities of modern research. To them we owe the beginnings of both the libraries and the museums of modern Europe.

In the generation following Petrarca the influence of the new learning makes itself widely felt in many forms of activity. Men whose early training had been chiefly as scholars came to be sought for services of every kind. Coluccio Salutati, one of Petrarca's most ardent admirers and imitators, spent his life as secretary of the Republic of Florence, at a time when the little State was involved in the most complicated relations with all the powers of Europe. It was his duty to write the elaborate Latin essays which were then the chief medium of diplomacy, and his fame rests upon the elegance and purity of this imitated classicism. Poggio Bracciolini filled for life a similar place in the Papal chancery, and was no less approved and applauded because his caustic humor reveled in ribald obscenities. Niccolò Niccoli was the business centre of the Florentine group of scholars, the earliest type of the modern book-collector and publisher. Ambrogio Traversari, general of the Order of Camaldoli, devoted much time to studying and editing the works of the

ancient. Francesco Filelfo was the earliest specimen of the haughty pedant, learned beyond others in all the detail of scholarship, but without the creative power that had marked the pioneers. He touched the schoolmasterly stage of the Revival when the work of discovery had largely been done, and when the exact distinction of the scholar was to be gained by a kind of technical skill quite independent of any largeness of mental equipment.

It is at this stage that we begin to see the results of the great expansion of interest due to the study of Greek. Petrarca had deeply felt the importance of this study, and had bemoaned his incapacity to engage in it. Greek was still a living tongue in parts of Southern Italy, and communication with the East was frequent enough, but Boccaccio, who seems really to have made the effort, found it impossible to procure suitable instruction. The men of the next generation, however, set themselves more earnestly to work; Greek teachers began to hear of the golden opportunities in the rich Italian towns, and Italian youths sought instruction at the ancient school of Athens. The earliest and most influential of these Greek teachers was Manuel Chrysoloras, a man of distinction in the public service at Constantinople, brought over to Italy by his duties in this capacity, and then employed as teacher of Greek at Florence. He died on his way to attend the Council of Constantine in 1415. Another Greek of later influence was John Argyropoulos (died c.1489), who was successively rector of Padua and professor at Florence and finally at Rome. Of Italians who illustrated the highest application of ancient culture to the development both of Italian literature and the perfection of classic learning, we may mention Guarino (d.1460), Poliziano (d.1494), and Lorenzo de' Medici (d.1492). The inherent charm of the Greek language and literature worked at once upon the highly sensitive Italian mind, revealing a new world of beauty and of meaning.

Circumstances favored a rapid spread of the new culture. The Italian cities, grown rich under democracy, but having tired somewhat of its responsibilities, had been passing into the control of that extraordinary series of despotic rulers who united with a brutal unscrupulousness of character a taste for the best in literature and art without a parallel. It was one of the chief claims to power for a new made tyrant like Cosimo de' Medici that he provided the means of existence for talent of every sort. Even the bloody rulers who, one after another, held power in Milan, made places for scholars and artists, maintained libraries, and encouraged learned research. The ancient universities of Bologna, Padua, and Salerno were reinvigorated by the healthful breath of the new learning and stimulated by the rivalry of the new schools founded by the younger republics. The Papacy, with a free hand after the Council of Basel (1431-49), passed into the control of a series of men like Nicholas V., Pius II., and Leo X., in whom the interest in learning and art was an absorbing passion. In fact, learning, under the Italian humanistic impulse, may be said to have taken on the form of a fine art and thus to have concealed much of its serious import. Under all these favoring conditions it is not strange that a certain dippaney of character

came to be associated with the cleverness of the fifteenth-century scholars. The lightness of Boccaccio had seemed the natural expression of exuberant joy in the natural things of human life. A century later this sincerity had largely given way to an over-refinement that knew no limits. Everything was permissible in the name of a æsthetic experiment. Without in any formal way renouncing their allegiance to Christianity, many became more really interested in philosophy than in doctrine, and became increasingly lax in following the ordinary forms of devotion.

It is here that we may best notice a distinction insisted upon by recent Roman Catholic scholars notably by Ludwig Pastor in his *History of the Popes*—between a 'true' and a 'false' Renaissance. By the former is meant the enlargement of scope and the clearing of the mental vision possible to men without departure from the traditions or the institutions of the Church. By a 'false' Renaissance is meant the exaggeration of the æsthetic and critical side of learning to a point where it must lead to indifference or even hostility to the clerical traditions.

A great change came over the spirit of the New Learning when it passed to the more serious, less artistic, and more deeply religious peoples of the North. The impulse which led young Germans and especially young Englishmen to cross the Alps and study the ancient classics under Italian teachers was largely the desire to find the very best means to acquire such training as would help them in the regular professions. There is in the North but little of the affected æstheticism of the later Italians. Such men as those whom Erasmus found in England at the end of the fifteenth century, John Colet, later Dean of Saint Paul's, founder of the most important boys' school in England and interpreter of Christianity by the method of a rational criticism; Groeyn, the most important agent in introducing the teaching of Greek into England; Thomas Linacre, founder of the London College of Physicians; and Thomas More, a busy lawyer, King's counselor, and social reformer, suggest a type of man totally different from the members of the Florentine 'Academy.' Yet all these men drew their intellectual inspiration from Italy, and were free to acknowledge their debt. Erasmus himself, with all his biting satire and his ready criticism of many serious things, was primarily the preacher of a sane rationalism based upon sound learning, and by this he always meant the learning of the New Method. 'Art for art's sake' never held the same place in the intellectual code of the North as in that of Italy, but the appreciation of learning was there none the less keen, and proved to be more lasting in its effect upon national character. One of the great services of the northern Humanism was the revival of the study of Hebrew on a scientific basis. What we have said of the mediæval study of Latin applies equally to that of Hebrew. It had been pursued by Jewish scholars with a view to the perpetuation of their racial institutions, but it had not been in any sense an instrument of culture. Johann Reuchlin, an elder contemporary of Luther and Erasmus, was the first to call attention to the importance of Hebrew in a complete scheme of Christian scholarship. He aroused a storm of opposition from the same obscurantist elements that had always been ready to persecute Jews as inevitably hostile to

all that bore the Christian name. He found his support wholly in the circle of enlightenment that had spread itself outward from the study of the Greek and Latin classics as a means of civilization. The party of the 'Reuchlinists' included all the forward-looking elements of German society and attracted the sympathy of the men of enlightenment everywhere. Its most characteristic expression is found in the *Epistole Obscurorum Virorum* (Letters of the Men of Darkness), the most galling satire of the Reformation period, in which the old scholastic method was held up to the derision of people who were quite ready to join in the laugh and to carry out the suggestion of reform.

The first quarter of the sixteenth century saw the capture of most of the great universities of the North by the new spirit. Even at Paris, the theological school, the Sorbonne, still defended the ancient faith, and largely by the ancient methods, while the Collège de France, founded by Francis I., became a seat of enlightened instruction. So at Louvain, one of the most solid bulwarks of the scholastic theology, a new school, established with the help of Erasmus, kept up the balance with success.

The great importance of the New Learning in its effect upon the Protestant Reformation is sufficiently shown by the studies of Luther, Calvin, Zwingli, and other leaders of the movement. No doubt the immediate effect of the Reformation was once more to turn men's minds away from purely æsthetic considerations, but the work of the New Learning had been done and could not be undone.

BIBLIOGRAPHY. The most important work on the general history of the Renaissance is Voigt, *Die Wiederbelebung des klassischen Altertums* (3d ed., Berlin, 1893). Consult also: Müntz, *Precursori e propugnatori del rinascimento* (Florence, 1902); Burekhardt, *Geschichte der Renaissance in Italien* (Stuttgart, 1890-91); id., *Kultur der Renaissance in Italien* (8th ed., Leipzig, 1901); Symonds, *The Renaissance in Italy* (London, 1877); Pater, *Studies in the History of the Renaissance* (ib., 1873); Biese, *Die Entwicklung des Naturgefühls im Mittelalter und der Neuzeit* (Leipzig, 1887); Robinson and Rolfe, *Petrarch* (New York, 1892); Seebohm, *Three Oxford Reformers* (3d ed., London, 1887); and the lives of Erasmus by Froude (ib., 1894), Drummond (ib., 1873), and Emerton (New York, 1899).

RENAISSANCE ART (OF., Fr. *renaissance*, from Lat. *renascens*, pres. part. of *renasci*, to be born again, from *res*, back again, anew + *nasci*, to be born). During the last decades of the fourteenth century and the first decades of the fifteenth a new spirit invaded the domain of art, asserting itself in a new enthusiasm for the study of man and the study of the antique. To the humanists in literature corresponded the realists, naturalists, and classicists in art. Antique art was re-discovered, but while the classical element preponderated in architecture and decoration, it was the element of realism that took possession of the arts of sculpture and painting. The flowering of the Renaissance into these new impulses was chiefly due to a few leading artists of Tuscany between 1390 and 1430; to the architect Brunelleschi, the sculptors Donatello, Quercia, and Ghiberti, and the painters Masolino, Masaccio, and others. Northern critics, however, have

shown that a strongly realistic school had previously developed in Burgundy, Northern France, and Flanders, especially in the sculpture of such artists as Claus Sluter, Beaumeveu, and Jean de Cambrai. The age of the Renaissance, though it practically closes before 1600, was not superseded by a Græco-classical revival until about the period of the French Revolution.

Painting was the typical art of the Renaissance because it best expressed its realism. In architecture the style was far less original, its character being less constructive than decorative. The preponderance of the secular spirit led to a decadence of religious art in all forms. The previous tendency toward general types in art gave way before a new individualistic tendency, each artist creating his own personal style. Only in painting were the peculiarities of local schools very prominent.

Tuscany was followed by Lombardy in the development of the Renaissance about 1460, and shortly afterwards by Venice. Rome and Naples were simply meeting places for Tuscan and Lombard artists. France was the first foreign country to follow the example of Italy, with whom its relations of all kinds had long been of the closest. Spain, in some parts, then followed quite early in the sixteenth century. Not till the middle of the century did Germany and England accept the new style to any large extent, and even then with less of pure beauty and classic precision than in Italy and France.

Renaissance sculpture and painting are of such importance in the history of the general development of these arts that it is most convenient to treat them under the general articles.

ARCHITECTURE—ITALY. Gothic architecture had never acquired a deep-rooted hold in Italy and Italian architects had been seeking for a new style ever since the decline of the Romanesque. This they found in a study of the Roman ruins, out of whose columns, entablatures, and arches they developed a style which, sharing the pagan spirit of Roman art, was more successful in secular than in religious buildings. Coming at a time of individualism, it developed personal and local phases of style, and its history is the history of the works of individuals, not of a national style. It developed into a system of decoration and composition rather than of construction, although it made effective use of the dome and vault. Several periods of Italian Renaissance can be distinguished: (1) Early or Free Renaissance, c. 1420-1500; (2) High or Classic Renaissance, c. 1500-1580; (3) the Decline of Barocco, c. 1580-1780. The founder of the style was the Florentine Brunelleschi, the greatest designer of the early Renaissance and equaled only by Michelangelo and Bramante among later men. In the Pazzi Chapel (1425) and the two great basilican churches of Santo Spirito and San Lorenzo he revived the moldings and details of classic architecture, but neither he nor his followers, Michelozzi and Giuliano da Majano, attempted any close imitation of Roman buildings. The two great palaces of this first period in Florence, viz. the Riccardi by Michelozzi (1430) and the Pitti (1435), though Roman in scale and in minor details, were of a thoroughly modern and Florentine type. Alberti was the first to attempt strictly Roman and classic exterior design in both religious and secular architecture by the use of

superposed orders, pilasters, entablatures, and Roman arches. Florentine architects of later date, Rossellino and Francesco di Giorgio, earned the new style to Pienza, Siena, and Cortona, and others, like the Majani, Laurana, and Giuliano di San Gallo, to Naples, Urbino, and Rome. The ducal palace at Urbino is one of the most imposing masterpieces of the Early Renaissance. In Lombardy the new style developed a prolific school of design which, retaining the use of terra cotta ornament, open arcades, and some mediæval details, was more varied and picturesque than the Florentine. Its influence was carried to Venice by the Lombards, and there gave rise to the most richly decorative of all the local Renaissance styles, through the free use of marble incrustations and surface carving. To Lombardy belongs also the most highly decorated façade of the Renaissance, that of the Certosa at Pavia; and from Lombardy came Bramante, the genius who inaugurated the Middle Renaissance, after his establishment in Rome in 1499.

While most of his predecessors had been primarily goldsmiths or decorators, Bramante was a master-builder, and became an architect in the true modern sense. He was the first to embody the genuine Roman spirit in modern design, as in his Tempietto, and in his designs for the Vatican and Saint Peter's (1503-06). Henceforth both the Lombard and early Tuscan systems of ornament were abandoned for plain surfaces and colossal details; the new style was severe and grandiose; only in the interiors was decoration still abundant. The design that embodied its best features was Bramante's plan for Saint Peter's. The Roman school under him now succeeded the Tuscan in the leadership, and the study of Vitruvius and the measuring and drawing of Roman ruins became an accepted part of every architect's training. Raphael, Peruzzi, and Antonio da San Gallo were among Bramante's foremost pupils; the Farnesina, Massimo, and Farnese palaces embody their ideas, the last named being the most imposing in Rome. But meanwhile the Venetian school had not lost the individual charm (see VENICE) of its civic and palace architecture under Tughelmo Bergamaseo and his rivals and then under the neo-classic leader Sansovino, whose Libreria di San Marco and Palazzo Comaro marked an epoch in Venetian architecture.

This middle period closes with Michelangelo, whose genius, like Bramante's, also ushered in a new period, that of the scientifically developed Renaissance, based upon the deepest study of classical monuments. Remodeled by Michelangelo, Saint Peter's remained even more the type for Renaissance churches. The dome, either single or grouped, the tunnel vault and cross vault, often coffered, continued the orthodox forms of covering. Internal piers became heavier, while columns often took the place of pilasters outside. The single order after the colossal example of it given at Saint Peter's by Michelangelo reigned supreme. Vignola's works present this style under a more refined aspect and mark the beginning of the villa architecture of the Roman school. (See LAXTE, VILLA.) In the palaces of Alessi and others at Genoa monumental stair-cases and vestibules are the central point for grandiose and original treatment, rather than the façades. The progressive domination of classic formulae is observed alike in the writings and

the buildings (especially at Vicenza) of Palladio. The term Palladian is generally used for this scientific-theoretical style, whose side lights were Vignola, Serlio, and Scamozzi. Its first great embodiment in Palladio's work was the arcade around the basilica at Vicenza, which was followed by other remarkable works, such as the Palazzo Chiericati, the Palazzo Tiene, and the Teatro Olimpico. He created his highest types of religious architecture in Venice with San Giorgio Maggiore and the Redentore, and through them produced a revolution.

Hard on his footsteps came the Barocco style (q.v.) (c.1575-1780). It was a reaction from Palladian severity and revelled in broken lines, vagaries of proportions and form, defiance of tradition. Domenico Fontana, Maderna, Bernini, and Borromini were its greatest representatives. Its masters produced sometimes a grandiose work like Bernini's colonnades of Saint Peter or a logical church facade, though Maderna failed utterly in that of Saint Peter's and succeeded better only in smaller buildings such as Santa Susanna. The works of Longhena (q.v.) at Venice were exceptions to the general rule of extravagance and bad taste. As in every final style of an architectural period, the picturesque predominated over the monumental. Rich colored marbles, heavy details of cupids, scroll-work, and architectural motives, even imitations in metal and marble of stuffs, as in Bernini's famous baldachin, are prominent.

FRANCE. The close political relations of Italy with France and the habit of calling in Italian artists, consequent upon the campaigns in Italy of Charles VIII., Louis XII., and Francis I., led to the introduction of Renaissance forms into France sooner than elsewhere; at the same time the strength of French Gothic traditions not only retarded the prevalence of Renaissance forms, but led to an internal reform rather than to the adoption of an Italian style. Religious architecture had been for some time on the wane and palace architecture in the ascendant. The first indications are most evident in decoration, where Lombard models prevail. The transitional period illustrated in the Château de Gaillon and in the older part of that of Blois (q.v.) is still prevalingly mediæval; but with Francis I. Gothic outlines tend to disappear and the classic orders to prevail. But it was not the foreign but the native artists to whom the fundamental changes were now due; first to the men of North France, like Fain and Biart; then to those of the Royal Domain, like Le Breton and Lemercier, while others, like Chambige in his unique Château of Saint Germain, remain outside of the Renaissance orbit even toward the middle of the seventeenth century. The greatest achievement was the transformation of the feudal castle into a superb and artistic residence, totally unlike anything known in Italy; such were Amboise, Blois (q.v.), Fontainebleau (q.v.), and especially Chambord (q.v.), with its great corner bastions and its forest of dormer windows, chimneys, and towers, a characteristic feature in which French differs so fundamentally from Italian Renaissance. These royal residences were almost rivaled by those of the nobility like Azay-le-Rideau and Chenonceaux (q.v.).

The closing years of Francis I. (died 1547) usher in a more classic style. Some of its leaders, like Jean Bullant, Du Cerceau, and Phil-

bert de l'Orme, studied in Italy; others, like Pierre Lescot, were undoubtedly familiar, through drawings, with Italian buildings. Lescot's creation of the Louvre (q.v.) (1546) is the classical example of the new style of royal palace without a trace of mediævalism, and is if anything superior to the contemporary work of San Gallo, Vignola, and Sansovino in Italy. One of its great charms lies in the magnificent sculptures of Jean Goujon and others, which make it unique in its decorative scheme. De l'Orme's Tuileries (q.v.) and Château of Anet were his masterpieces. Under Francis I., Henry II., and Charles IX. France was covered, especially in the region of the Loire, with châteaux of similar types, with civic structures like the town halls of Beaugency and Paris, and with innumerable city houses of the nobility and bourgeoisie. The changes brought about by a further influx of Italian ideas under Maria de' Medici involved loss of charm, as well as force in later works. Additions were made to the royal palaces such as the Tuileries, the Louvre, and Fontainebleau and a new palace, the Luxembourg (q.v.), was built by one of the leaders of the new school, Salomon de Brosse, who improved upon his Italian model, the Pitti Palace. Lemercier was very successful in his additions to the Louvre and in the Sorbonne. Through all this middle period there is a constant struggle between Italian classic and barocco tendencies and the French love of the picturesque, but French architects did not go to the extreme either of scientific frigidity or lawless eccentricity.

Under Louis XIV. a more fanciful decoration mingled with the formal Palladian architecture. Mansart showed in his colossal palace of Versailles the chilling effects of this formal classicism, but he achieved greater success in his dome of the Invalides. The masterpiece of the time was, however, the superb Corinthian colonnade of the east front of the Louvre, by which the palace was completed, from the designs of Perrault. The interior decorative work of this period in France has an originality and delicacy that places it as much above contemporary work in Italy as the early decoration had been inferior. Under Louis XV. Italian ideas obtained complete possession of exterior design and of church architecture both exterior and interior, though in domestic architecture the interior decoration and furniture display a remarkable fantastic originality. The Paris Pantheon by Soufflot (q.v.) represents the formal Roman classicism that prevailed in the latter part of the eighteenth century.

GERMANY. The Renaissance as a style in art and especially in architecture made its way more slowly in Germany than elsewhere, except in England; partly, no doubt, because the movement was so largely concerned with religious questions. When the new style entered Germany it was from Carinthia, Bohemia, and Tyrol, rather than from Italy, and Italian architects were employed in Prague, Craeow, Gran, and Vienna, long before the creation of the earliest examples of the style even in South Germany, while the northern States were still slower in receiving it. The real transformation of German architecture began after the Peace of Augsburg (1555), and is to be seen in the castles of the princes and barons, the houses of wealthy burghers, and guilds, and the *Rathäuser* of the town

councils, rather than in royal palaces or in religious buildings. Indeed, Saint Michael's, Munich, is the only really important church edifice of the sixteenth century in all Germany (1582). Until the Palladian or rather the Italian Baroque style invaded Germany, late in the seventeenth century, the Germans retained in their Renaissance buildings unchanged many of their national and mediæval features—high roofs, vast stepped gables of fanciful outline, dormers running through two or three stories, spiral stair towers, oriels, the irregular plans of the feudal castles, and a predilection for old, fantastic, and picturesque combinations of form and detail. The orders appear rarely except in portals or in pilasters, and then treated with utter disregard of classic canons, and court arcades of the classic type are not to be found, the Germans preferring stumpy columns with segmental arches to the Italian type. The style appears, therefore, at its best in the smaller street fronts of narrow houses, or the picturesque masses of castles on the hillsides, as at Torgau, or in the highly ornate Otto Heinrichsbau (1554) and Friedrichsbau (1601) of the great castle at Heidelberg, which are generally considered the masterpieces of the first period. The town halls of Altenburg, Danzig, Augsburg, Rothenburg, and Bremen (from 1562 to 1612) and others of less importance form another interesting group of examples of the style. In the later or Baroque period there were many palaces erected or enlarged of moderate architectural interest, except in the case of the Zwinger at Dresden (1711), which is one of the finest and most consistent examples of the Rococo extant; and there were also a number of interesting churches in this style (e.g. Marienkirche at Dresden). Landscape architecture after the style of Versailles was highly developed in this period.

BELGIUM AND HOLLAND. In these closely related countries Renaissance architecture developed very differently; though late in both. Belgium was strongly affected by both French and Spanish influences, as in the fantastic semi-Spanish episcopal palace at Liège by Borset (1508), and produced but one monumental edifice of classic type, the Antwerp town hall (1564). As in Germany, many of the most characteristic Renaissance works are guild halls and narrow street fronts, as on the great square at Brussels, the Boatmen's houses at Ghent, etc. Even more successful were many sumptuous choir screens, altars, and pulpits, both in Belgium and Holland. In the latter country the Renaissance produced almost no works of real importance, though some of the Dutch town halls are worthy of notice, as at The Hague (1565), Amsterdam (1655), and Leyden (1597). With these may be classed also the Amsterdam Bourse, and in Denmark the Exchange at Copenhagen. The use of brick, of stepped gables, and of a simple and naïf style of design gives a certain charm to many less important Dutch buildings.

SPAIN. Although the Renaissance in architecture entered Spain largely through the work of Flemish artists, it developed more rapidly and produced more important works than in Flanders. The exuberant decorative spirit of Spanish late Gothic and Moresque art appears in the elegant detail of the Plateresque, as the early phase of the Renaissance in Spain is called, in such structures as the Santa Cruz Hospital at

Toledo, the College at Alcalá de Henares, and the Ayuntamiento at Seville, all between 1500 and 1520. About 1525 church architecture was radically modified by the new style, as shown in the cathedrals of Jaén (1525) and Granada (1529) and San Domingo at Salamanca. But hardly had this begun when Berruguete returned from Italy and brought with him the High Renaissance in the Palladian form, which was further developed by Herrera. This second phase of Spanish Renaissance is called the Greco-Roman, and it ruled until the close of the seventeenth century. The palace of Charles V. at Granada is a noble structure by Machuca and Berruguete, rusticated below, colonnaded above, of good proportions and well planned. One building especially corresponds in its vastness to the greatness and character of Spanish power, viz. the Escorial (q.v.), a huge rectangle, simple and uninteresting except in its domical church, which is an impressive edifice of classic style. In such works as these Italian ideas are reproduced with greater fidelity and absence of local national traits than in any other country. On the other hand, when under the leadership of Churriguera an extreme form of Baroque or Rococo pervaded Spain, the national leaning toward elaborate detail and over-decoration of surfaces ran riot as never before. Some of the royal palaces (Madrid and San Ildefonso) built in the eighteenth century escape it, but with few exceptions it prevailed.

PORTUGAL hardly holds any independent position. Its masterpiece of the sixteenth century, the group of monuments at Belem, is the *comb* of luxuriant expression of the mixed late Gothic and pseudo-Renaissance design.

ENGLAND. Latest of all countries to employ the Renaissance style was England. Under Elizabeth and James I. (1558-1625) there were sporadic examples and a sprinkling of the new style of decoration in Tudor work. There were some Italian artists like Torrigiano and Giovanni of Padua, but they had to adapt themselves to Tudor requirements, except in a few cases such as the Chius Gate at Cambridge. Inigo Jones changed the trend of architecture and led to the universal adoption of the pure Italian High Renaissance of the Palladian type before the middle of the seventeenth century, his happiest effort being the palace at Whitehall (q.v.). His work was carried forward by Wren, whose masterpiece, Saint Paul's Cathedral (q.v.), is one of the great buildings of Europe. It combined the Renaissance groups of domes with the typical ground plan of an English Gothic cathedral. Wren's sobriety and consistency gave a character of good taste to all contemporary English architecture, which continued throughout the eighteenth century under the leadership of men like Van Brugh, the designer of Blenheim, Hawksmoor, and Gibbs, who built Saint Martin-in-the-Fields and the Radcliffe Library, Oxford. These men and their successors, Chambers, Adams, Taylor, and Dance, show a progressive degeneration in point of originality up to the close of the century, when the wave of purely Greek Renaissance struck England and was embodied in buildings like the Bank of England (see SOANE), the British Museum (q.v.), the Fitzwilliam Museum, Cambridge, and the fine Saint George's Hall, Liverpool (q.v.).

RENAIX, re-nâ'. A town of Belgium, in the Province of East Flanders, picturesque situated, 24 miles by railway south of Ghent (Map: Belgium, B 4). It manufactures principally fine linen and damasks, woolen fabrics, tobacco, and pottery. Population, in 1900, 20,090.

RENAL DISEASE. See BRIGHT'S DISEASE; CIRRHOSIS.

RENAN, re-nân', ERNEST (1823-92). A French religious historian and Semitic philologist, born at Tréguier, in Brittany, February 27, 1823. Of his childhood he told in *Souvenirs d'enfance* (1883). He lost his father in youth and owed it to a devoted sister that he could begin with neighboring priests the studies for which his frail health seemed to designate him. He was soon summoned to Paris and promoted to Saint-Sulpice, the chief training school of the French priesthood. His belief in the Catholic teaching soon began to leave him, but not his love for its beauty, nor his regard for its worthy professors. At twenty-two he abandoned his study for orders and taught Latin in a clerical school, still aided by his sister's savings, till at twenty-five he won his doctorate with such distinction as to assure a position that was already recognized by an academic prize for an essay *Sur les langues scythiques*. He won a second prize in 1850 for an essay *Sur l'étude du grec dans l'occident au moyen-âge*, was sent by the Academy to Italy, where he prepared an epoch-making work on Arab philosophy, *Arrocs*

et l'Aristotélisme (1852), and to Syria (1860), where he found inspiration for his *Vie de Jésus* (1863), the first of seven volumes that occupied him from 1867 to 1881, dealing with the origins of Christianity to the death of Marcus Aurelius. To this he added as an introduction *L'histoire du peuple d'Israël* (1888-94). Though elected professor of Hebrew in the Collège de France (1862), he was not allowed to lecture, because of his expressed unorthodoxy. This gave wide popularity to his ideas and allowed him more leisure to propagate his enthusiastic belief that politics, education, and ethics itself would be regenerated by the progress of science, especially of history and philology. The *Vie de Jésus* was widely translated; 300,000 copies were sold in France alone, and for every later work of Renan there was a popular as well as a scholarly demand. *Les apôtres* (1866) and *Saint Paul* (1869) were followed by a volume of essays on contemporary questions (1868). Then came the Franco-German war, which evoked from Renan two remarkable letters to David Strauss, the radical biblical critic of Tübingen, showing a patriotism free from every taint of Chauvinism. The Republic restored his professorship and he now published *L'Antéchrist* (1873), *Les crânes et la seconde génération chrétienne* (1877), *L'église chrétienne* (1879), *Marc-Aurèle et la fin du monde antique* (1881). Volumes of essays with the titles *Etudes* (1857), *Essais* (1859), *Mélanges* (1878), *Nouvelles études* (1884), *Discours* (1887), accompanied or followed his more connected work. His *Drames philosophiques* were first collected in 1888. A vision of *L'avenir de la science*, written in 1848, was given to the world as a sort of parting gift in 1890. During his last years Renan enjoyed all the honors, public and private, that Paris could give to a favorite scholar. He was made grand officer of the Legion of Honor and administrator of the Collège de France, dying as he had wished, at his post, October 2, 1892. Renan saw so many sides of his subject that he was never as sure of any of them as he was of his own critical wit. He was by turns hazy, cautious, mythical, ironic, idealistic, skeptic, all with a romantic sentiment and a rosy optimism that regarded the nineteenth as "the most amusing of centuries," to be contemplated with "benevolent and universal irony." He had a lofty conception of moral duty, and held that "few persons have a right not to believe in Christianity." He knew that he himself was "a tissue of contradictions, one half fated to be employed in destroying the other," and he said this fact gave him "the keenest intellectual pleasure that man can enjoy." The clew to this psychic paradox is perhaps that Renan united two races, the Breton and the Norman, and two cultures, the ecclesiastical and the scientific, neither overcoming the other, and both possessing his mind. It is this, joined to a uniquely subtle, sensuous charm, that has made his influence a powerful one in the literature of the present generation. He typifies the skepticism of modern France, its awakening religious curiosity, its dilettante shrinking from "the horrible mania of certainty," its Protean inconsistency and its easy tolerance, born of a conviction that no faith is worth a struggle, much less a martyrdom. Of Renan's works there is no uniform edition. The writings named above may be added many linguistic studies in the *Mémoires* of the Academy and in the *Journal Asiatique*, important con-

tributions to the monumental *Histoire littéraire de la France* (vols. 24-30), translations of *Job* (1858), *The Song of Songs* (1860), *Ecclesiastes* (1881), and many lesser essays. The titles and dates of the *Philosophic Dramas* are *Caliban* (1878), *L'eau de jeunesse* (1880), *Le prêtre de Nemi* (1885), *1802, Dialogue des morts* (1886), *L'abbesse de Jouarre* (1887). There are English translations of the whole *Histoire du peuple d'Israël* and of the *Origines du christianisme*, of the *Études* and *Nouvelles études*, of *Job* and the *Song of Songs*, and of the *Souvenirs*. For Renan's life and character consult his own *Souvenirs d'enfance et de jeunesse* (1833), his *Feuilles détachées* (1892), and *Lettres intimes* (1896); also the monographs by Bourget, in *Essais de psychologie contemporaine* (Paris, 1883); Reinach (ib., 1893); Abbé d'Hulst (ib., 1894); Séailles (ib., 1895); and Mountstuart Duff (London, 1893); also Lemaître, *Les contemporains* (Paris, 1890-92); and Monod, *Les maîtres d'histoire* (ib., 1894).

His son **ARY** (1858—), born in Paris, became known as a landscape and figure painter and artist, and was a pupil of Delannay and of Puvion de Chavannes. He began to exhibit in the Salon in 1880, contributed many critical essays to the *Gazette des Beaux-Arts*, of which he afterwards became secretary, and in 1900 published an interesting monograph on Gustave Moreau (q.v.).

RENSBURG, rēnsbōrk. A town in the Province of Schleswig-Holstein, Prussia, situated on the Eider and the Kaiser-Wilhelm Canal, about 15 miles south of Schleswig (Map: Germany, D 1). It has a thirteenth-century church, a gymnasium, a Realschule, and manufactures of woollens, pianos, fertilizers, meat products, leather, and artificial stone. It carries on a considerable trade in lumber and cattle. Rensburg is first mentioned in the twelfth century. Population, in 1900, 14,757, chiefly Protestants.

RENÉ, re-nā', surnamed 'The Good' (1409-80). Count of Provence, Duke of Anjou and Lorraine, and titular King of Naples. He was born at Angers, January 16, 1409, being the second son of Louis II. of Anjou and Provence. He married Isabella of Lorraine and claimed the succession to the Duchy of Lorraine in 1431, after the death of his father-in-law, Duke Charles. Being opposed by another claimant, the Count of Vandemont, René was defeated and taken prisoner, remaining a captive for several years. In 1434 he inherited Provence and Anjou on the death of his brother, Louis III. In 1437 he purchased his liberty and the possession of Lorraine by the payment of an immense sum. He now led an army into Italy to secure the Kingdom of Naples, the title to the succession to which had been left to him by Louis III., who had been adopted as her successor by Queen Joanna II., by whom René had been declared heir on the death of his brother. (See JOANNA II.) He had a powerful rival in Alfonso V. (q.v.), King of Aragon, who succeeded in capturing Naples in 1442. Weary of the vain struggle, René abandoned the kingdom and returned to Provence, where his Court at Aix became a famous resort for artists and poets. He sought to revive the poetry of old Provence, and his devotion to the forms of a rapidly disappearing chivalry gained him the name of the last of the Troubadours. Agriculture and manufactures

were also encouraged and he earned his title of 'The Good.' He refused the crown of Aragon when offered to him, but allowed his son to accept it. His daughter, Margaret, married Henry VI. of England. After a long and prosperous rule, René died at Aix. He had no direct heirs and his possessions, therefore, reverted to the French Crown. For his literary productions see *Œuvres du roi René*, edited by Quatrebarbes (4 vols., Angers, 1844-66); and for his life, Leroy de la Marche, *Le roi René, sa vie et ses travaux* (Paris, 1875); Villeneuve-Bargemont, *Histoire de René d'Anjou, roi de Naples* (ib., 1825); Champollion-Figeac, *Les tournois du roi René* (ib., 1826).

RENÉE (re-nā') OF FRANCE (dt. *Renata*) (1510-c.1574). A French princess, daughter of Louis XII., born at Blois, and married in 1527 to Ercole II., of the House of Este (q.v.), Duke of Ferrara. With him she differed greatly on religious matters, being a zealous patron of the Reformation, of Calvin, to whom she gave refuge in 1535, and of Brucelli, who dedicated to her his version of the Bible in Italian. Ercole's Catholicism made his wife a subject for the Inquisition. She was imprisoned in 1554, confessed and attended mass, but after her liberation resumed her allegiance to Protestantism. After her husband's death (1559) she returned to France, and there attempted to unify the forces of Reform. Calvin wrote her many letters of counsel. Consult: Fontana, *Renata di Francia, duchessa di Ferrara* (Rome, 1888-93); and Rodocanachi, *Renée de France* (Paris, 1896).

RENEVIER, rēn'vyā', ERGÈNE (1831—). A Swiss geologist, born and educated in Lausanne. There he became professor of geology, paleontology, and mineralogy in 1857, curator of the Vaudois Geological Museum in 1864, and a founder of the Swiss Geological Society and of the Paleontological Association (1874). Besides many important contributions to periodicals and work on the international geological chart of Europe, he wrote *Description des fossiles du terrain aptien* (1854-58, with Pietet); *Notices sur les Alpes vaudoises* (1864-79); *Carte géologique des Alpes vaudoises* (1875-77); *Orographie des Hautes Alpes* (3d ed., 1881); and *Chronographie géologique* (1896).

RENFREW. A southwestern county of Scotland, bounded on the north and west by the River and Firth of Clyde, on the south by Ayrshire, and east and north by Lanarkshire (Map: Scotland, D 4). Area, 245 square miles. Renfrew is very uneven in its surface, and consequently in the nature and quality of its soil. At the Hill of Stake, on the Ayrshire border, the land rises to 1711 feet. Over two-thirds of the arable land is devoted to dairy farming. There are extensive mineral deposits in the county, and the exportation of coal, oil, and iron-stone employs a large number of people. Chief towns, Renfrew, the capital, Greenock, Port Glasgow, and Paisley (q.v.). Population, in 1801, 78,500; in 1851, 161,100; in 1891, 230,812; in 1901, 268,900.

RENFREW. A royal, Parliamentary, and municipal burgh, capital of Renfrewshire, Scotland, on the Clyde, six miles west-northwest of Glasgow (Map: Scotland, D 1). The Renfrew Grammar School and Blythswood Testimonial, originally endowed by charter of Robert III., is

born. The important are employed in non-wood and in ship-building. Population, in 1901, 3270.

RENI, GIÚLIO, GENO (1575-1642). An Italian painter, one of the chief masters of the Eclectic School (Bolognese). Born at Calvenzano, near Bologna, November 4, 1575, the son of a musician, he was apprenticed at an early age to Denys Calvaert. He then studied under the Carracci, especially under Lodovico, but aroused their jealousy, and soon parted company with them, and applied himself to the technique of fresco-painting under Ferrantini. His first short visit to Rome in 1599, in company with Francesco Albani, a friend and fellow student, was given chiefly to the study of Raphael, and after some years of further study at Bologna of nature and of classic models, we find him again at Rome in 1605. His development was marked by works very dissimilar in style, those of his early years partaking of the manner of Caravaggio, as, for example, the "Crucifixion of Saint Peter" (1606, Vatican); the "Madonna della Pieta" (Pinacoteca, Bologna); and "The Hermits Saint Paul and Saint Anthony" (Berlin Museum). From this influence, however, he soon freed himself, forming a style of his own, tinged with refined idealism, in strong contrast to the coarse realism of Caravaggio, and exemplified by the "Concert of Angels" (1608), a charming fresco in the Chapel of Santa Silvia (San Gregorio, Rome), and the world-famed "Triumph of Phobus," generally known as "Aurora" (1609, fresco in the Palazzo Rospiglioso, ib.)—his great masterpiece of this period, unequalled in nobility of line and poetry of color.

In 1610 Pope Paul V. commissioned Guido to decorate the chapel in the Quirinal and other private chapels, which works increased his reputation, as well as the number of his enemies, even the friendship of Albani turning into antagonism. After his return to Bologna in 1612, Guido painted "Saint Paul Reproaching Saint Peter" (Brera Gallery, Milan), quite Venetian in conception; the "Massacre of the Innocents" (Pinacoteca, Bologna), a work full of vigor and resplendent in that warm golden tone characteristic of the artist's middle period; the "Apotheosis of Saint Dominic," an imposing fresco in San Domenico, Bologna; and "Four Episodes from the Myth of Hercules" (Louvre). In 1620 he decorated a chapel in the cathedral at Ravenna, and in 1621 he went to Naples, commissioned to execute frescoes in the cathedral, but was compelled by the murderous jealousy of the Neapolitan painters to flee to Rome without accomplishing his task. Forced by intrigues to leave Rome, too, in 1622, he returned to Bologna, where he became the acknowledged head of the Eclectic School, and resided until his death, August 18, 1642. The tone of his pictures gradually changed to a pale silvery gray, and in the later part of his life his manner became slight and sketchy, his constant pecuniary difficulties, caused by his inveterate passion for gambling, inducing him to paint with careless haste to retrieve his heavy losses.

The most important works of the next decade were the "Triumph of Samson Over the Philistines" (Pinacoteca, Bologna), still in his purest golden tone; a "Judith" (Palazzo Adorno, Genoa); "Fortuna" (Academia, San Luca, Rome), one of his finest treatments of female

form; and, above all, the "Rape of Helen" (c.1630, Louvre). Masterpieces in his silvery manner include the famous representations of "Saint Sebastian" (the finest in the Pinacoteca, Bologna); others in the Capitol, Rome, and in the Louvre, and the "Nativity" (Lichtenstein Gallery, Vienna, an unfinished replica in San Martino, Naples); pronounced by some authorities the artist's finest creation. Favorite subjects with him and his school were the "Ecce Homo," the most celebrated specimens of which are those in the Vienna (two), London, Bologna, and Dresden galleries; the "Cleopatra," best in the Madrid Museum and the Palazzo Pitti, Florence; and the "Penitent Magdalen," of which the Louvre and the Lichtenstein Gallery, Vienna, contain each two examples, the Madrid Museum, the National Gallery, London, and the Pinakothek in Munich, each one. The type of melancholy beauty, familiar through the supposed portrait of "Beatrice Cenci" (1599) in the Palazzo Barberini, Rome, frequently recurs in his paintings. In his art, Guido is an Eclectic, lacking in originality. From a technical standpoint his works are good, both as to color, composition, and drawing; but they are full of sentimentality, and he was one of the first to introduce the soft style so disastrous to the development of art. Consult: Bolognini-Amorini, *Vita del celebre pittore Guido Reni* (Bologna, 1839); Lanzi (Roscoe), *History of Painting in Italy*, iii. (London, 1847); Janitschek, in Dohme, *Kunst und Künstler Italiens*, iii. (Leipzig, 1879); and the authorities referred to under BOLOGNESE SCHOOL OF PAINTING.

RENIER, RENYÁ, LÉON (1809-85). A French archaeologist, born in Charleville (Ardennes), and educated at Rheims. For a time he was a proof-reader and then became instructor and principal in the College of Nesle in Picardy. Then he went to Paris, taught Latin and Greek for several years, collaborated with Philip Le Bas on the *Dictionnaire encyclopédique de la France* (1840-45), and on Didot's *Encyclopedie*, and was an editor of Courtin's *Encyclopedie moderne* (1845-51). In 1860, after thirteen years in the Sorbonne Library, he became its director and in 1861 became professor of epigraphy at the College de France. His great educational work was the foundation of the Ecole des Hautes Etudes with Duruy in 1868. A part of Borghesi's works was edited under his care, and he took a prominent part in the excavations of the Farnesi Gardens, and in the purchase of the Campana collections. His work on the inscriptions of Gaul was not completed; his most important publication was *Inscriptions romaines de l'Algérie* (1855-58).

REN'NELL, JAMES (1742-1830). An eminent British geographer and explorer. He lost his father when a mere boy, but found a home in the family of Mr. Burrington, vicar of Chudleigh, from whom he received his early education. When fourteen years old he joined the frigate *Brilliant* as midshipman, and five years later was an officer in the British Navy. He had already developed a love for geography by study and his many opportunities for surveying harbors and drawing charts. He made such a reputation by his harbor charts that soon after he left the navy in 1763, to take service with the East India Company, he was appointed Surveyor-General of Bengal. For the next fif-

GUIDO RENI
"AURORA," FROM THE FRESCO IN THE ROSFIGLIOSI PALACE, ROME

teen years he spent most of his time in the jungle and on the plains of Bengal. The large amount of map material he collected was used in the preparation of the *Bengal Atlas*, which appeared in 1779, a work of the first importance for strategical and administrative purposes. His map of Hindustan, accompanied by about 200 pages of letterpress, appeared in 1783, and marked the time when Rennell ceased to be merely a surveyor and map-maker and became a geographer in the more extended sense. Rennell lived for the remainder of his life in London, and for fifty years, from 1780 to 1830, he was one of the leading geographers of Europe, and the great critic of geographical work and elucidator of geographical problems. Comfortably established with his wife and children in London, he began the construction of the first approximately correct map of India, and many years elapsed before it was superseded by the more accurate trigonometrical survey. He then turned his attention to Western Asia between India and the Mediterranean. He had conceived a scheme for a great work on the comparative geography of Western Asia, but he never completely carried it out, his *Geography of Herodotus*, which formed only a part of the whole project, occupying him for many years. This work has been of permanent value to geographical students.

Rennell's studies of Herodotus made him a very high authority on all matters relating to African geography, and he became the coadjutor of the African Association when that body inaugurated the modern era of the exploration of that continent. His map of Northern Africa, prepared for the use of the association, was the result of immense research combined with sagacious reasoning. He elucidated the reports of explorers, and his maps illustrated their travels. He worked up, for example, the rough notes of Mungo Park, examined his daily routes with great care, compared them critically with previous work in West Africa, and brought all the materials into harmony as far as possible. He constructed the map of the discoveries of Mungo Park. As a hydrographer, also, Rennell made important advances in the study of winds and currents, and was the founder of that branch of geography which is now called oceanography. Rennell's volume on winds and currents is based upon an enormous mass of material which he collected to illustrate the subjects. The current now known as Rennell's current, a stream in the ocean moving northward athwart the mouth of the English and Irish channels, was revealed by his study of a great number of facts collected by seamen. His wind and current charts, published only after his death, contained a large amount of information of service to mariners. His body was buried in Westminster Abbey.

RENNES, *rën*. The capital of the Department of Ille-et-Vilaine, France, at the confluence of the rivers Ille and Vilaine, 155 miles east of Brest by rail (Map: France, E 3). It is divided into the upper or new town and the lower or old town. It has remains of its mediæval walls, towers, and gates, beyond which lie extensive suburbs. Bridges unite the two divisions of the town, the older portions of which lie on the left bank of the quay-lined Vilaine. The most noteworthy buildings are the modern cathedral, whose interior is a spacious hall of Grecian architecture, the stately Palais de Justice, the

Hôtel de Ville, the Lycée, the Palais Universitaire with its fine art museum, and the handsome modern university. Tree-lined boulevards, the spacious Champ-de-Mars with a war monument commemorating 1870-71, and the Jardin des Plantes, add to the town's attractions. It carries on an active trade and has manufactures of agricultural implements, stockings, lace, sail-cloths, and earthenware. The town is the seat of an archbishopric and of a university, which has an attendance of about 1150. It was almost totally destroyed by a great fire in 1720, and was rebuilt on a modern plan. Rennes is the Celtic *Condate*, the capital of the Gallic tribe of the Redones, whence the modern name. Under the Romans it was an important station. In the Middle Ages it was the capital of the Duchy of Brittany (q.v.). Population, in 1901, 74,676.

RENNET (from ME. *rennen*, *rinnen*, AS. *rinnan*, *rynna*, Goth., *riſig*, *rinna*, Ger. *rinnen*, to run; connected with Lat. *rinus*, stream, Skt. *ar*, to move). A substance obtained from the fourth or digestive stomach of calves living upon milk, and also from the stomachs of puppies and pigs. The active principle is obtained from the folds of the membrane lining the stomach, and is prepared commercially by soaking this lining in warm slightly salted water, filtering the resulting extract, and adding a little salt and saltpetre to preserve it. These extracts are generally used in place of the home-made preparations formerly in use. They are of uniform strength, free from taints, and retain their strength and purity for a considerable time. The active principle, *rennin*, an enzyme or ferment, has the power of coagulating or curdling the casein of milk. The extracts also contain more or less pepsin, the digestive ferment of the stomach. The action of rennet is impaired by heat, and the ferment is destroyed by high heat. The principal use of rennet or rennet extract is in making cheese, where it is employed to curdle the milk, and thus form the curd. See CHEESE-MAKING.

RENNIE, GEORGE (1791-1866). An English civil engineer. He was born in Surrey, the eldest son of John Rennie (q.v.), and at the age of sixteen entered Edinburgh University. He returned to London in 1811, and began the practical study of engineering under his father. In 1818 he was appointed superintendent of the machinery of the mint, and at the same time aided his father in the planning and designing of several of his later works. After his father's death, in 1821, Rennie entered into partnership with his younger brother, John (afterwards Sir John Rennie), as engineer and machinery constructor. Their operations included the construction of bridges, harbors, docks, shipyards, and dredging machinery, steam factories, both in Great Britain and on the Continent, and the furnishing of engines for warships of England, Russia, France, Italy, Mexico, etc. Rennie in addition was engaged in the drainage of large tracts in the midland counties of England and the construction of several Continental railways. He was greatly interested in the development of the screw propeller, and after building the engines for the *Archimedes* boat with a novel form of screw, constructed the *Dwarf*, the first screw vessel in the British Navy. He was the author of various papers published in the *Philosophical Transactions*.

RENNIE, JOHN (1761-1821). A British civil engineer, was born at Phantassie, in Fife-shire, and obtained his preliminary education at the Parish school of Prestonkirk, and afterwards at two years at Dumfries, where he studied pure mathematics. After serving as a workman he studied at Edinburgh, and in 1780 secured employment at the works of Boulton & Watt at Soho, near Birmingham. Here his mechanical genius soon displayed itself, and so highly did Watt esteem Rennie that he gave him, in 1789, the sole direction of the construction and fitting up of the machinery of the Abbot Mills, London; and the ingenious improvements effected in the wheel work, shafting, and frames were so striking that Rennie at once rose into general notice as an engineer of great promise. To this mill engineering he added, about 1799, the construction of bridges; and in this branch also his talent and ingenuity were manifest. The elegance and solidity of his constructions, the chief examples of which were at Kelso, Leeds, Musselburg, Newton-Stewart, Boston, and New Galloway, were universally admired; Rennie's greatest work of this kind was the Waterloo Bridge over the Thames. Another of his works was the Southwark Bridge, which was built on a new principle, with cast-iron arches resting on stone piers. He also drew up the plan for the London Bridge, which, however, was not commenced until after his death. He superintended the execution of the Grand Western Canal in Somerset, the Polbrook Canal in Cornwall, the canal joining the Don and Dee in Aberdeen, that between Arundel and Portsmouth, and, chief of all, the Kennet and Avon Canal between Newbury and Bath. The London Docks, the East and West India docks (see DOCK) at Blackwall with their freight sheds, the Hull Docks, the Prince's Docks at Liverpool, and those of Dublin, Greenock, and Leith, were all designed and wholly or partially executed under his superintendence. He also planned many improvements of harbors and on the dock yards of Portsmouth, Chatham, Sheerness, and Plymouth, executing at the last-mentioned port the most remarkable of all his naval works, the celebrated breakwater. (See BREAKWATER.) Rennie died October 16, 1821, and was buried in Saint Paul's Cathedral, London. Consult Smiles, *Lives of the Engineers* (London, 1861-62; rev. ed. 1874).

RENNIE, Sir JOHN (1794-1874). An English civil engineer. He was born in London of a great engineering family, being a son of John Rennie (1761-1821), with whom he studied until 1813, when he became Hollingsworth's assistant on the Waterloo Bridge. With his father he worked on the Southwark Bridge in 1815, and after studying abroad went into partnership with his brother, John Rennie, who was knighted in 1833 on the completion of the London Bridge after his father's plans. He also finished his father's work as engineer to the Admiralty, building the Brompton breakwater, and draining the Lincolnshire fens. The Whitehaven and Cardiff docks and the restoration of Boston harbor are the most important of his original works. Rennie was an accomplished draughtsman and author of *Theory, Practice, and Construction of British and Foreign Harbors* (1851-54). Consult his autobiography (London, 1875).

RENO. The largest city of Nevada and the county seat of Washoe County, 31 miles south

of Carson City; on the Truckee River, and on the Southern Pacific, the Virginia and Truckee, and the Nevada, California and Oregon railroads. (Map; Nevada, D 2). It is the seat of the Nevada State University, opened in 1886; and among other features are the United States Government Agricultural Experiment Station and the Nevada State Hospital for Mental Diseases. Reno is situated in a section devoted to farming, mining, and stock-raising, and is the most important business and industrial centre in the State. Settled in 1868, Reno was incorporated in 1897, but was disincorporated two years later. It received its present city charter in 1903. Population, in 1890, 3563; in 1900, 4500.

RENO, JESSE LEE (1823-62). An American soldier, born at Wheeling, Va. (now W. Va.). He graduated at West Point in 1846; was brevetted second lieutenant of ordnance; and soon afterwards was ordered to the front in Mexico, where he fought under General Scott from Vera Cruz to the City of Mexico. From that time until 1861 he was employed in various routine duties and advanced to be captain. On the outbreak of the Civil War he was commissioned brigadier-general of volunteers and was assigned to a brigade in General Burnside's North Carolina expedition (December 20, 1861-April, 1862), with which he participated in the capture of Roanoke Island, and the actions of Newbern and Camden. For these services he was promoted to be major-general of volunteers, and in August was ordered north to Virginia, where he fought in the second battle of Bull Run and at Chantilly. During the succeeding Maryland campaign he commanded the Ninth Corps, and was killed leading his men at the battle of South Mountain.

RENOIR, re-nwâr', AUGUSTE (1841-). A French figure and landscape painter, born in Limoges. He studied in the atelier of Gleyre and with Monet and the other Impressionists, and exhibited in 1874 at the first Impressionist Salon. Renoir is one of the most distinctive of the group, and, like Degas, devoted himself principally to figures, especially portraits of young women and children, in which he renders the texture of flesh and the most fleeting shades of expression with astonishing adroitness. His figures are painted out of doors, and are subject to every variation of light and reflection. He also painted landscape, fruit, and flower subjects, and groups of figures. His paintings include: "La loge;" "La danse;" "Danse à la ville;" "Le déjeuner à Bougival;" "La balance;" "Le pont de Chatou;" and "Jeunes filles au piano." Among his portraits are those of Wagner and Claude Monet. Consult: Duret, *Les peintres impressionistes* . . . (Paris, 1879), and Alexandre, *Catalogue de l'Exposition de A. Renoir* (Paris, 1892).

RENOUF, re-nwôf', EMILE (1845-94). A French landscape, marine, and genre painter, born in Paris. He was a pupil of Boulanger, Lefebvre, and Carolus-Duran. His works usually represent scenes in the lives of fisherfolk or purely marine subjects. "The Helping Hand" (in the Corcoran Gallery at Washington, D. C.), a boatman rowing while his child holds the oar, is one of his best-known works. He also painted several views near Honfleur, and a picture of the

Brooklyn Bridge (in the Haye Museum), done while he was in New York City in 1887-88. He received a medal of the first class at Munich in 1883 and the Legion of Honor in 1889.

RENOUF, SIR PETER LE PAGE (1822-97). An English Egyptologist, born in the island of Guernsey, August 23, 1822. He received his early education at Elizabeth College and went later to Oxford, where he formed a lasting friendship with the Rev. John Henry, afterwards Cardinal, Newman. He took an active part in the Tractarian controversy, and in 1842 was received into the Roman Catholic Church at Saint Mary's College, Oscott, where he began the study of Oriental languages together with theology and philosophy. In 1846 he undertook the tuition of the young Marquis de Vaublanc, and until 1855 resided on the Continent, where he formed the acquaintance of many of the most distinguished scholars of the time. From 1855 to 1864 he was professor in the Catholic University at Dublin, lecturing at first upon French literature and the history of philosophy, and later upon ancient history and Oriental languages. It was during this time that he took up the study of Egyptian, and he soon became one of the foremost as well as one of the most conscientious and reliable Egyptologists of his day. In 1864 he left the university to accept an appointment from the Government as one of the chief inspectors of schools, a position which he held for over twenty years. He visited Egypt in 1875 and spent some time there studying the monuments. From March, 1886, until the end of 1891 he was keeper of the Egyptian and Assyrian antiquities in the British Museum, and in 1896 he was knighted in recognition of his distinguished scholarship. From 1887 until his death he was president of the Society of Biblical Archaeology. He died in London, October 14, 1897. Renouf was a versatile scholar, and in addition to his Egyptological attainments he possessed a knowledge of most of the ancient and modern Semitic, Indo-European, Berber, and Finnic languages. In his later years he also became a student of Chinese. He was a very prolific writer and contributed a large number of valuable articles to *Atlantis*, *Proceedings of the Society of Biblical Archaeology*, *Zeitschrift für ägyptische Sprache*, and other periodicals. He also translated a number of Egyptian texts for *Records of the Past*. In 1879 he delivered the second course of the Hibbert Lectures, and the following year he published his *Lectures on the Origin and Growth of Religion, as Illustrated by the Religion of Ancient Egypt* (1880; 2d ed., 1884). Renouf's great work was his masterly translation of the Egyptian Book of the Dead (q.v.), the study of which formed his chief occupation for nearly forty years. The translation, accompanied by a valuable commentary, was published serially in the *Proceedings of the Society of Biblical Archaeology* (vol. xiv., 1892, et seq.) and was unfinished at his death, but was completed from the author's manuscript notes by E. Naville (q.v.). A biography of Renouf and a full bibliography of his writings are to be found in *Proceedings of the Society of Biblical Archaeology* (vol. xix., London, 1897).

RENOUVIER, re-nōō'vāī'. CHARLES BERNARD (1815-). A French philosopher and politician. He became known through his *Manuel de*

philosophie moderne (1842) and his *Manuel de philosophie ancienne* (1840). After the Revolution of 1848 he published a *Manuel républicain de l'homme et du citoyen* (1848), which was condemned for its socialistic propositions. He retired from public life after the coup d'état of 1851. From 1872 until 1900 he was associate editor of *La Critique philosophique*, and he published *Essais de critique générale* (1854), *Science de morale* (1869), and *Esquisse d'une classification systématique des doctrines philosophiques* (2 vols., 1885).

RENO'VO. A borough in Clinton County, Pennsylvania, 28 miles northwest of Lock Haven, on the Philadelphia and Erie division of the Pennsylvania Railroad (Map: Pennsylvania, D 2). It is of some importance as a summer resort, being situated near the Alleghany Mountains, in a picturesque region. There are valuable deposits of bituminous coal and fire clay, and manufactories of fire brick; shops of the Pennsylvania Railroad are here. Population, in 1900, 4082.

RENSSELAER, rēn'se-lār. A city in Rensselaer County, New York, on the Hudson River, directly opposite Albany, with which it is connected by three bridges, and on the New York Central and Hudson River and the Boston and Albany railroads (Map: New York, G 3). It is situated in an agricultural and dairying region, and manufactures felt, leather, ice tools, chains, shirt waists, and lumber products; but is important chiefly as a railroad town, having shops, round-houses, freight yards, etc. Rensselaer was chartered as a city in 1897, having been known formerly as Greenbush, which was incorporated as a village in 1815. In 1902 the village of Bath, with a population in 1900 of 2504, was annexed to Rensselaer. Population, in 1890, 7301; in 1900, 7466.

RENSSELAER POLYTECHNIC INSTITUTE. A school of engineering and science at Troy, New York, founded by Stephen Van Rensselaer in 1824 as Rensselaer School and reorganized in 1850 under the present name on the basis of a general polytechnic institute. It was the first school of science and the first school of engineering established in any English-speaking country, and has long been famous for its engineering courses. Opportunities for investigation and research are offered by the many well-known engineering works within reach of the school. In 1902 the electrical and chemical laboratories were destroyed by fire, but were rebuilt, and with the other laboratories are equipped with machinery and appliances of the most modern type. The students in 1903 numbered 309 and the faculty 20. The Institute owns valuable collections and a scientific library of 6700 volumes and 3500 pamphlets.

RENT (OF., Fr. *rente*, It. *rendita*, income, from ML. *reddere*, nasalized form of Lat. *reddere*, to restore, return). In political economy, the term rent, when used without a qualifying phrase, refers to the payment which is made for the use of land. In the payments popularly known as rent are usually included two elements, one of which may be classed as interest on buildings and other improvements, the other as economic rent. The economic rent of any given piece of land is measured by the difference between the prices which its products obtain and the cost of

the amount of capital employed in producing the product.

Under the conditions of a new community, with an abundance of accessible land, and with the soil, it is obvious that so long as the product of the best land is more than sufficient to satisfy the community's wants there will be no rent. Producers will be on an equality, and if any difference exists between the value of the product and the costs of production in labor and capital, it will be the same for all. As population increases the product of the best grade of lands no longer suffices to satisfy the want for food. Prices of food will rise until it will pay to bring inferior lands under cultivation. Permanent prices will have to be sufficient to cover costs in labor and capital upon these inferior lands. Since the cost of production on the better land does not increase, a surplus value will emerge in the produce of these lands. This surplus value is rent. If the owner of the better land cultivate the ground not in person, but by tenants, this surplus is what the latter can afford to pay the landlord for the use of his land. If the favored producers are themselves cultivators, they receive the rent directly in the increased returns of their husbandry.

This simple illustration suffices to explain the law of rent, which may be briefly stated as follows: Rent of land is the difference between the cost of the product and its value, the latter being determined by the cost of production upon the poorest land cultivated. In an isolated community the increase of population and the resulting pressure upon the food supply must always enhance rent, as cultivation must be extended from better to poorer soils. In other words, the pressure of population upon the means of subsistence creates rent on those lands where the means of subsistence can most easily be produced. Again we may assume all the available land of the community to be in cultivation and yet the pressure upon the means of subsistence increases. Now even if all the land were uniform in quality but deficient in quantity rent must appear. No increase of product can be obtained without application of additional labor and capital to the soil. This will not be so fruitful as the first application, and hence the latter must yield a rent. In this phase the law of rent may be stated as follows: The rent of land is the difference between the value of the product and its costs, value being determined by the costs of production for the product due to the least fruitful increment of capital and labor employed in cultivation. It follows that rent is a result, not a cause of price. This principle was demonstrated by Ricardo and until recent decades was thought to establish a perfectly clear distinction between rent and other economic incomes. The rise of the Austrian school of economists (see *POLITICAL ECONOMY*) has, however, tended to break down this distinction in incomes. Labor and capital, like land, receive their value from their product. While it is true that no form of goods will long be produced which does not pay the prevailing rates of interest and wages, it is no less true that an agricultural product will not be produced unless it pays the ordinary rate of rent.

One of the most important practical principles that have been deduced from the demonstration of the law of rent is that a tax levied upon rent

or upon the value of land, which represents merely the capitalization of the rental value, cannot raise the price to the consumer of the product of the land. This principle has served as a basis for the plan of social reform of Henry George. (See *SINGLE TAX*.) The fact that every increase in population or in capital increases the return to the landlord quite without his own efforts served as an ethical justification for a plan of appropriation to the State of ground rents. Recent economic theory has widely extended the application of the theory of rent. Since the time of Senior (q.v.) the term has been frequently applied to the net income from monopoly advantages, whether natural or legal. Profits (q.v.) are frequently classed as a form of rent; and Clark applies the term to any form of income which may be described differentially.

In the language of Marshall, "the rent of land is no unique fact, but simply the chief species of a large genus of economic phenomena; the theory of the rent of land is no isolated economic doctrine, but merely one of the chief applications of a particular corollary from the general theory of demand and supply." The theory of the rent of land occupies a large space in all systematic presentations of political economy. A compact statement is found in Walker, *Land and Its Rent* (Boston, 1883).

RENT. In its most ancient as well as its modern sense, compensation payable by a tenant to his landlord for the land held of him. Rent has never been an incident of tenure, but even under the feudal system of land-holding and when due from tenant in fee simple to his lord, rent was due only as matter of contract. It was, indeed, the service agreed by the feudal tenant to be performed (*servitium redditum*), which might or might not include a money payment, and which varied according to the tenure upon which the land was held, according to the custom of the manor of which it formed a part, or according to the will of the parties.

In much the same way the obligation of the modern tenant for life or years to pay rent to his landlord is based entirely on agreement expressed in the lease or implied from the acts of the parties as to the time and manner as well as the duty of payment. This being so, a failure to pay rent does not ordinarily affect the relation of landlord and tenant so as to enable the landlord to enter and terminate the lease, nor can a tenant by terminating the relation of tenure between himself and his landlord (as by assigning his entire estate to a third person) relieve himself of the obligation to pay the rent agreed. Rent is equally independent of any other violations of duty by either party, excepting only the breach of the covenant for quiet enjoyment implied in every letting of lands.

As already indicated, a failure to pay rent does not in and of itself involve a forfeiture of the tenant's estate. The landlord's proper remedy is an action at law for the rent due. At common law, however, he was provided with a more efficacious remedy in the process known as levying a distress. See *DISTRESS*.

The rents described by Blackstone in his famous chapter on incorporeal hereditaments (Blackstone II. 41-43), as "certain profits issuing yearly out of lands and tenements corporeal," are obviously a very different thing from those which have just been described. The rent here

referred to is a right in the nature of an easement, or more accurately a profit *à prendre*, in the land of another, and it comes into existence, not by agreement or in connection with a lease, but, as such incorporeal rights always do, by grant or prescription. The right to take the rent is a species of real property which may be held, like any other estate, for life or years or in fee, and which is capable of alienation, and, if held in fee, of transmission by inheritance. The common law distinguished three kinds of such rents, viz. rent service, rent charge, and rent seek. The *rent service* was merely the old feudal rent surviving into a period which had forgotten its origin. It existed only when lands were held by one of another in fee, and where, accordingly, the rent due was in the nature of a feudal service. The *rent charge* is the rent just described as arising by grant of the owner of the land on which it is charged. The distinguishing characteristic of this was the fact that it was enforceable by distress. The *rent seek* was merely the rent charge without the power of distress annexed. Of these three forms of rent the rent service is obsolete, excepting, perhaps, in a few manors in England (see QUOTRENT); rent charge survives unchanged except where distress has been abolished, and there all rents charged on land by deed or will are properly rents seek. It is to the class of rents charge, rather than of contract rents, that we must refer the so-called *fee-farm rents*. See FEE.

Consult the *Commentaries* of Blackstone and Kent; Williams, *Law of Real Property* (19th ed., London, 1901); Maine, *Early History of Institutions* (Amer. ed., New York, 1895). See INCORPOREAL; HEREDITAMENT; LANDLORD AND TENANT; LEASE.

RENUNCIATION. In law, the disavowal or abandonment of an official or property right. Of the latter class are the renunciation by an heir, devisee, or legatee of the property, real or personal, to which by operation of law or under the will of his testator he is entitled. Of the former class is the more frequent case of the refusal by an executor, administrator, or trustee of the office conferred upon him. The formality of renunciation is in either case of the simplest character, a letter or other written expression of intention being the usual form. In Scotland the term renunciation is employed to denote the surrender (q.v.) of an estate for life or years to the landlord.

REN'WICK, JAMES (1662-88). A Scottish Covenanter, born at Moniaive, Dumfriesshire. He was a student at Edinburgh University, but received no degree there, because of his refusal to acknowledge Charles II. as head of the Church, and therefore finished his theological education at Groningen, Holland. In 1683 he returned to Scotland and began preaching at conventicles. He was outlawed for his collaboration with Alexander Shields in *An Informatory Vindication of the Covenanters* (1684). In 1687 he had become the virtual leader of the Cameronians, who were excluded from the Act of Toleration, and was finally captured and executed at Edinburgh.

RENWICK, JAMES (1818-95). An American architect. He was born in New York and educated at Columbia College. He constructed the

distributing reservoir of the Croton Aqueduct in New York City and was for some years an architect on the Erie Railroad. Among the buildings designed by him are Vassar College, Poughkeepsie, New York; Saint Patrick's Cathedral, Grace, and Calvary Church, New York; and the Smithsonian Institution and Corcoran Gallery at Washington. He left a valuable art collection to the Metropolitan Museum.

REPAIRS. In the law of real property, such acts of construction and amendment as are necessary to keep the buildings of an estate from deterioration and decay. By the common law of England and America the obligation to repair rests on the tenant in possession, whether his estate be for life or years. It is, in fact, an incident of such a tenancy and flows from the doctrine of waste, and this includes the wholesale restoration of premises destroyed by fire, as well as current repairs called for by ordinary uses or mere lapse of time, excepting where (as now generally in the United States) this harsh rule of the common law has been modified by statute. The obligation to repair does not extend to a tenant at will or at sufferance, nor to a joint tenant or tenant in common (whether in possession of the premises or not), nor generally to a mortgagee in possession.

This common-law obligation of the tenant to keep the premises in repair is sometimes varied by local custom and more frequently by agreement of the parties. See EVICTION; LANDLORD AND TENANT; LEASE; WASTE.

REPARATION (Lat. *reparatio*, from *reparare*, to restore, repair, from *re*, back again, anew + *parare*, to prepare). In law, the redress of an injury by making compensation therefor, or by restoring something which has been unlawfully taken from one entitled to its possession. See DAMAGES.

REPEAL (OF. *rapeler*, Fr. *rappeler*, to recall, revoke, repeal, from *re*, back + OF. *apeler*, Fr. *appeler*, to call, appeal, from Lat. *appellare*, to address, appeal, to call, summon). The obliteration or abrogation of a statute by another act of a legislative body. Where an act declares in positive terms that another shall be abrogated, it is said to be an *express* repeal, but where a statute contains absolutely inconsistent provisions with a prior one, and does not refer to it directly, it is said to repeal the latter by *implication*. It is in the latter class of cases that the greatest difficulty arises. The provisions of the subsequent act must be absolutely contrary or repugnant to those of the former, so that it is clear that they must have been intended to supersede the former, in order to work out a repeal by implication. An act may repeal only portions of another, and the provisions not thus expressly repealed will continue in force. The same is true where a subsequent statute is only inconsistent with a former one in some provisions. Where it is desired to alter some of the provisions of an act, it is usually *amended*, by striking out some part of it and substituting new provisions. An amendment, therefore, is a change or alteration, whereas a repealing act abrogates or wipes out the provisions of the statute to which it applies. Under the common law the subsequent repeal of an express repealing act has the effect of restoring or reviving the statute which had been abrogated by the latter, but this

rule has been abolished in England and many of the United States.

REPEATING RIFLE. See **SMALL ARMS.**

REPENTANCE (GEE., Fr. *repentance*, from ML. *rep. penes*, repentant, from Lat. *re-*, back again, anew; *penitere*, to repent, frequentative of *penite*, *penare*, to punish, from *pena*, punishment), expiation, pain, from Gk. *πενή*, *pené*, punishment; connected with Gk. *ἔπειν*, *lucra*, Skt. *ca*, to avenge). Sorrow for sin and renunciation of the same. It is intimately connected with faith (q.v.), since faith is the turning of the soul toward God, and repentance is the same act considered as a turning away from sin. It is synonymous with conversion when used of the original and decisive abandonment of sin which marks the beginning of the Christian life; but, unlike conversion, which occurs but once, daily repentance should follow daily sins. It is a consequent of regeneration (q.v.), which is God's act calling forth repentance and conversion. Adequate repentance embraces all sin as such, known or forgotten, and involves the condemning sentence of conscience and the voluntary activity of the will in forsaking it, and both choosing and executing acts of holiness in its place. The motive leading to an evangelical repentance must be nothing short of a perception of the evil of sin in itself, as violating the law of conscience and of God. Any lesser motive, as sense of danger or fear of the wrath of God, is not sufficient to produce a true repentance, which must embrace the love of God and sincere submission to His holy will. Every act of repentance involves a new girding up of the soul to new resistance to temptation. Such repentance is always accepted of God and followed by the divine forgiveness.

REPHAÏM, *rēf'ā'im* or *rē-fā'im* (Heb. *rēph-āim*). (1) A popular name of the prehistoric inhabitants of Palestine, especially to the east of the Arabah (q.v.). The Hebrew *rāphā* means 'weak,' and hence is used of the shades of the dead (e.g. Is. xiv. 9). The term appears to have been applied to the early legendary inhabitants, whose ghosts were supposed still to haunt their ancient homes. But the myth-making process magnified them into giants, and the word received this connotation. In this sense the word may be used in II. Sam. xxi. 16 et seq. Most definite are the interesting antiquarian notes in Deut. ii. 10, 20, where reference is made to the predecessors of Moab and Ammon, and they are described as a gigantic folk; compare the tradition concerning the Anakim, whom Israel encountered in South Palestine (Num. xiii. 33). In Deut. iii. 11, Og, the King of Bashan, is recorded as a descendant of this gigantic race, and the proof of his stature is given in an enormous bedstead of iron. These notes are paralleled by the etymology of Gen. xiv. Consult Driver, *Commentary on Deuteronomy*, p. 40 (London, 1895). (2) *The Valley of Rephaim*. The scene of the two battles in which David broke the power of the Philistines (II. Sam. v. 18, 22; xxvii. 13; I. Chron. xiv. 9 et seq.); also famous for fertility (Is. xvii. 5). The location is given in Josh. xv. 8, 9; xviii. 16, as contiguous to the Valley of Hinnom, and is identified with the broad valley running for two miles southwest from Jerusalem, a strategic vantage point for the invaders, and also afford-

ing cooperation with the non-Israelitish city of Jerusalem. Some would associate the name with the race of the Rephaim.

REPH'IDIM (Heb. *Rēph'idim*, probably refreshments, from *rāphad*, to support, succor). A station in the route of Israel through the peninsula of Sinai (Exod. xvii. 1, 8; xix. 2; Num. xxxiii. 14 et seq.). It was the scene of a rebellion of the people for lack of water, which Moses supplied by a miracle, whence, according to tradition, the names Massah (tempting) and Meribah (striving) were given to the place. Here Israel routed Amalek by miraculous interposition, an account of which was recorded in writing. Here Jethro, Moses's father-in-law, paid him a visit. But, as in the case of most of the Sinaitic stations, no local tradition of the name survives. It has often been identified with the oasis of Feiran, north of Mount Serbal; it would be a fitting prize of war between Amalek and Israel, but, on the other hand, the lack of water does not agree with the nature of the oasis. The modern theory, which takes the Exodus through the northern part of the peninsula, finds there no tradition of the name. Consult: Robinson, *Biblical Researches*, vol. i. (Boston, 1841); Palmer, *Desert of the Exodus* (Cambridge, 1871).

REPIN, *ryā'p'in*, ИЛІА ЯЕФИМОВИТЧ (1844—). A noted Russian painter, born in the Government of Kharkov. The son of a poor Cossack officer, he was first instructed by an obscure painter in his native place, and soon earned a living by painting saints' images until enabled, in 1865, to attend the Academy at Saint Petersburg, where his "Raising of Jairus's Daughter" (1871) brought him the great gold medal, accompanied by a stipend entitling him to study abroad for six years. His real master, however, had been Ivan Kramskoy (1837-87). Before starting on his travels, he painted (1872) at Moscow a series of life-size portraits of Russian, Polish, and Czech composers for a concert hall, and in 1873 he exhibited in Vienna the "Burlaki" (Barge-men on the Tow-path), a remarkable work. His best picture, dating from his foreign sojourn, was "Szadko in the Wondrous Realm of the Sea," based upon a national legend. For this he was elected a member of the Academy (1876), where he subsequently became professor. Among a series of historical and legendary subjects and genre scenes which followed, the best known are: "The Czarevna Sofia at the Chapel-Window" (1879); "Return of the Dying Soldier" (1883); "Back from Siberia" (1884); "Ivan the Terrible and His Slain Son" (1885), and "Saint Nicholas Staying an Execution" (1889), the last two in the Alexander Museum, Saint Petersburg. After 1886 he devoted himself almost exclusively to portraiture, his subjects including Liszt, Rubinstein, Garshin, Pissenski, and Tolstoy. Characteristic of Repin's earlier work is the element of gloom and oppressiveness. He interpreted what he saw of the dumb, patient suffering around him, and, like Tolstoy, had the profoundest compassion for humanity. A happier atmosphere pervades some of his later pictures, and technically all his works exhibit great power and freedom of treatment, subsiding occasionally even into impressionism. A humorous note—unusual in this artist—is sounded in the "Holiday

"Evening" (1881) and "Country Life in the Crimea" (1888). The Tretiakoff Gallery in Moscow preserves more than fifty of his paintings. Consult the monograph by Norden (Vienna, 1894); Hapgood, "A Russian National Artist," in *The Century Magazine*, xxiii. (New York, 1892); and Muther, *A History of Modern Painting*, iii. (ib., 1896).

REPLEVIN (OF, *replevin*, from *replevir*, from ML. *replirire*, to warrant, pledge, from *re-*, back again, anew + *plirire*, *pligrare*, to pledge). An action brought to recover the possession of goods and chattels unlawfully taken, or wrongfully detained. Under the old common law practice it was only employed to recover back goods which had been unlawfully taken from the owner, as by the ancient proceeding of distress for rent, and *detinue* was used for the recovery of chattels unlawfully detained. To-day in most jurisdictions replevin, or some action of like nature, is employed for the recovery of chattels wrongfully withheld. In the action a writ is issued for the seizure of the goods, and the plaintiff is required to file a sufficient bond to cover damages which may result to the defendant. The defendant may by statute in some States give a bond and retain possession until the action is determined. Any person who is entitled to the possession of property may maintain the action, and the defendant must rely on the strength of his own rights rather than on the weakness of the plaintiff's title. The plaintiff should allege in his complaint or declaration the value of the chattels, and what damage he has sustained, and in such case is entitled to an alternative verdict and judgment commanding the return of the goods, and if that is not possible, the payment of their value, and in each case damages for their detention. The defendant must return the goods if possible, and he does not have the option of paying their assessed value instead. If the defendant is successful he is entitled to recover such damages as he has sustained, and may sue on the plaintiff's bond. Replevin is a possessory action and corresponds to ejectment (q.v.) as to real estate. See CHATTEL; DETINUE; TROVER; PROPERTY.

REPLICA. See COPY.

REPORT. A written or printed account of a case which has been judicially determined. Such an account, in the most complete and accurate reports, is usually composed of a brief statement of the facts of the case prepared by the editor or the reporter, a brief summary of the arguments of counsel, including a statement of the authorities cited by them on the argument or in their briefs, and the opinion of the court. The opinion also frequently contains a statement of the facts, a statement of the court's decision of the case, and the reasoning and the authorities upon which the decision is based. The report of the case may also include dissenting opinions. The value and use of precedents in the English common law (see PRECEDENT) make the careful preparation and preservation of reports of decided cases of the highest importance. Beginning with the reports of cases contained in the Year Books (Edw. II. to Henry VIII.) there is a complete series of reports of cases decided in the higher English courts down to the present time. In each of the United States there are published reports of all cases decided by the courts having appellate jurisdiction, going back to the date

of their organization; and there are also complete reports of the cases decided in the United States Supreme Court and the inferior Federal courts having appellate jurisdiction since their creation under the United States Constitution.

The Year Books were prepared at public expense by scribes of court or reporters who were appointed to that duty, a function which unfortunately was abandoned at the close of the reign of Henry VIII. After that time the reports were the work of private lawyers, and they sometimes bear evidences of hasty and inaccurate preparation. Some of them, however, prepared by lawyers of great learning, are of the highest value as authorities. The various editors of English reports number in all about one hundred. The following are a few of the more important early law reports following the Year Books: Dyer (1513-82), Coke (1572-1618), Hobart (1603-25), Croke (1582-1644), Yelverton (1603-13), Saunders (1678-84), Vaughan (1665-74), Raymond (1694-1734), Salkeld (1689-1712), Strange (1716-49), East (1800-12). The first chancery reports were published after the Restoration, although West's *Synobolography*, published in the latter part of the reign of Elizabeth, contained some precedents of process, bills, and answers in chancery. The first chancery reports, entitled "Reports of Cases Taken and Adjudged in Chancery in the Reign of Charles I., Charles II., James II., William III., and Queen Anne," were inaccurate and of little value. Of the other early chancery reports the following are the more important: Vernon (1680-1719), Peer Williamson (1700-35), Vesey, Sr. (1746-1836), Vesey, Jr. (1789-1817), and Atkins (1736-54).

In the United States generally, reports of cases are now published by public officials appointed for that purpose by the court, and in those States in which the law and equity systems have been merged, law and equity cases are published together. The increase in volume of litigation has resulted in recent years in an enormous increase in the number of reports, and has led to the consideration of various plans for curtailing their number.

Consult: Wallace, *The Reporters Chronologically Arranged with Occasional Remarks on Their Respective Merits*; Daniel, *History and Origin of Law Reports* (London, 1881); Wambaugh, *Study of Cases* (Boston, 1884). For a complete list of reports, see Soule, *Lawyers' Reference Manual of Law Books and Citations* (Boston, 1884).

REPOUSSÉ (Fr., beaten back). A process of ornamenting thin metal by producing a pattern or design with a hammer. The finest existing specimens of this work are those of Benvenuto Cellini (q.v.), made in the sixteenth century. The art was extensively practiced by the early Egyptians and Etruscans.

In repoussé work a hammer with an elastic handle is used, which is sewed to a permanent support. Many adjustable heads are provided to suit the different parts of the work. After the pattern is roughly hammered up from the inside the design is perfected on the outside with chasing tools. In order to make this possible, a bed of some soft but resisting material is used to furnish a support for the thin, pliant metal. If the work is a hollow vessel it may be filled with melted pitch, which is permitted to harden.

The art is most successfully applied to such metals as gold, silver, copper, tin, and brass. A more effect, though lacking in artistic individuality, is produced by stamping on metals. See DIES AND DIE-STAMPING; EMBOSSING.

REP'PLIER, AGNES (1855—). An American novelist of French descent, born in Philadelphia, Pa., April 1, 1855. Miss Reppler was educated at the Convent of the Sacred Heart at Torresdale, Pa. She is known for her travels and for many articles in such magazines as *Scribner's* and the *Atlantic Monthly*. Her lively essay style often deals with serious subjects in a vein of light, humorous banter, sometimes tinged with extravagant and witty irony. Her published volumes include: *Books and Men* (1888); *Points of View* (1892); *Essays in Miniature* (1892); a *Book of Famous Verse* (edited, 1892); *Essays in Idleness* (1893), perhaps her most popular work; *In the Dozy Hours, and Other Papers* (1894); *Varia* (1897); *Philadelphia: The Place and the People* (1898); *The Fireside Sphinx* (1901).

REPRESENTATION (Lat. *representatio*, from *representare*, to represent, from *re-*, back again, anew + *presantare*, to present, from *presens*, present, pres. part. of *presens*, to be at hand, to be before, from *par*, before + *esse*, to be). In political science, the agency through which the collective will of the people is exercised. In the city States of Greece and Italy, where pure democracies prevailed, all the citizens, in theory at least, attended the public assemblies. The comparatively small geographical area of the city State and the relatively small number of persons vested with the full rights of citizenship made it possible to govern without resort to the agency of representation. Besides, government was a simple matter then as compared with the government of a modern community, and hence the body of citizens meeting at intervals could without difficulty frame the few police regulations that were necessary and administer justice among the inhabitants. The agency of representation was first extensively employed by the Church in the ecumenical councils which it called from time to time, and this may have led to its more general employment for purposes of civil government. The idea of political representation, like many other political institutions, was a contribution of the Teutonic nations, by whom it was employed in a rude way in their popular assemblies. The first European legislature founded on the principle of representation was the Parliament of England. (See **PARLIAMENT**.) In 1302 Philip the Fair, King of France, summoned representatives of the three estates, nobility, clergy, and commons, to form the States-General (q.v.). In 1308 the Cortes (q.v.) acquired a very important share in the government, and grew to be powerful enough to impose its will upon the monarch. In other countries of Europe about the same time national representative bodies were organized by royal authority. The medieval idea of representation was representation of classes and interests rather than of numbers, which is the basis of the modern idea. Each order had its own representatives, who sat apart and carried on their work independently, one class thus being able to neutralize the action of the others. A like action was made in Eng-

land between rural and urban constituencies, each having its own representatives, and this is still perpetuated.

With regard to the principle of representation it may be said that the civilized nations have reached a consensus that the distribution of representatives, in one branch of the legislature at least, should be on the basis of the whole population, though some regard is frequently paid to permanent administrative or local divisions, partly for historical reasons and partly as a concession to local consciousness. Thus it is a common provision in national constitutions that each State or other division shall have at least one representative in the national legislature, although on the basis of population alone it would not be so entitled. (See section on *Government*, under the various countries.) In the upper chambers of lawmaking bodies throughout the world there is considerable diversity in the principle of representation. See **LEGISLATURE**.

As regards the relation of the representative to his constituency, a popular view is that the representative is the mouthpiece of his constituency and subject to their instructions. According to this view he has no independent judgment, and cannot follow the convictions which he may have reached from the most exhaustive study and reflection, if the will of his constituency be otherwise. Moreover, their own local interests are to be preferred to those of the country at large, and it is his first and foremost duty to champion those interests in preference to the national interests. A sounder view regards the representative as the interpreter of the common consciousness of right and reason. According to this view the representative is not bound by the will of his constituency, but by research and reason endeavors to discover what the general good requires. The question has been much discussed as to whether a system of representation based on mere numbers is an ideal one or even a just one. By many it is contended that an equitable system of representation would take into consideration various interests, economic, industrial, social, and religious as well as political. They insist that provision should be made for special representation of such classes as free-traders, single-tax adherents, labor organizations, civic federations, business leagues, chambers of commerce, the advocates of temperance and prohibition, socialists, etc. The tremendous tendency toward class differentiation and the growing popularity of independent movements in politics, it is said, make a reform of the present system of representation highly desirable so as to harmonize conflicting interests, to enable each class to show the people what its interests are, and to defend them against attack.

By the present system, the political party having a minority of voters in a given electoral district is generally unrepresented in the government, notwithstanding the fact that its numerical strength may lack but a few votes of equaling the party which secures the entire representation. As a result of this system, it frequently happens that the minority party in a State is inadequately represented in the State legislature or in Congress. To remedy these inequalities various methods have been proposed, and in some cases attempted. Of the more important of these the first to be mentioned

is the so-called 'limited vote,' according to which each voter in an electoral area is allowed to vote for a certain number of the candidates, usually one less than the number to be elected, so that if three members are to be elected from the district the minority is reasonably sure of electing one member. This method may be employed only in elections in which three or more representatives are to be chosen from the district. The chief objection to this method is that it does not allow the minority party proportional representation, but only limited representation. Moreover, it allows representation only to a very large minority and makes no provision for third parties and independent movements. Another method is the so-called 'cumulative vote,' which allows the elector as many votes as there are representatives to be chosen from the district, and which permits him to distribute them among the different candidates as he pleases, or cumulate them on one or more candidates. The advantage of this method over the first mentioned is that it enables a small minority to elect at least one member by cumulating their votes. Since 1870 it has been employed in Illinois for the election of representatives in the Legislature. The chief objection to this method is that it frequently involves a waste of votes, since a popular candidate may receive many more votes than actually necessary to elect him. As a result of this it may happen that the minority party actually succeeds in electing two representatives out of three.

What is known as the Hare or Andrae system, so called because proposed by an Englishman named Hare, and introduced into Denmark by Andrae, provides for the election of representatives by general ticket, and allows each elector to vote for one candidate or for a limited number, but permits him to indicate his second and third choices, etc. The total number of votes cast is divided by the number of representatives to be chosen, and the quotient is taken as the amount necessary to elect any candidate. In counting the ballots only the first choices are counted, and as soon as a candidate has received a number of votes equal to the electoral quotient he is declared elected, and no more votes are counted for him. The remaining ballots which designate him as first choice are then counted for the candidate having second choice, and so on down the list until the necessary number of persons have been declared elected. Under this system the waste of votes is insignificant, but its complexity is an objection, and the element of chance enters into the scheme. Finally there is the 'free list' system, according to which a certain number of voters may nominate a number of candidates not exceeding the number of places to be filled. Each voter casts as many votes as there are representatives to be chosen, distributing them at will, but not cumulating them on any one candidate. The number of votes necessary to elect is determined by dividing the total vote cast by the number of places to be filled. The total vote cast by each party is then divided by the electoral quotient and the result is the number of representatives to which each party is entitled. Any deficiency is supplied from those parties having the largest fractional quotas. This plan possesses the advantage of economy and secures proportional representation.

REPRESENTATION. In law, a statement or assertion as to some matter of fact. Representations have significance in a legal sense when they are acted upon. Such representations may be made as the basis of numerous legal transactions. See DECEIT; FRAUD; CAVEAT EMPTOR; CONDITION; SALE; WARRANTY, etc.

In the law of inheritance the term representation is also used to denote the principle upon which the issue of a deceased person take or inherit the share of an estate which their immediate ancestor would have inherited had he been living. Thus if one dies leaving two children and the children of a deceased child surviving him, the children will each inherit one-third of the real estate of the deceased and the other third will go to the children of the deceased child who are said to take by representation. See ADMINISTRATION (in Law).

REPRESENTATIVES, HOUSE OF. The Lower House of the Congress of the United States. See UNITED STATES; CONGRESS; COMMITTEES.

REPRIEVE (doublet of *reprovo*, from OE. *reprover*, *reprover*, Fr. *reprover*, to reprove, reject, from Lat. *reprobare*, to condemn, reject, from *res*, back again, anew + *probare*, to test, prove, from *probus*, good). The temporary suspension of a sentence for a crime, granted by the pardoning power, which is usually the chief magistrate of a State or nation. The term is most commonly employed to denote a stay of execution of a person convicted of a capital crime. Reprieves are usually granted in order to allow an investigation into the legality of the conviction, or into alleged 'newly discovered evidence' in favor of the condemned person. They are also granted in case of pregnancy of a woman condemned to death, in cases of alleged insanity after condemnation to death, and often pending an investigation of facts urged in an application for a pardon. See PARDON.

REPRISAL (OE. *repressalle*, Fr. *reprisaille*, from *reprise*, prize, a taking, from *repris*, p.p. of *reprendre*, to retake, from Lat. *reprehendere*, *reprehendere*, to recover back, blame, from *res*, back again, anew + *prehendere*, *prehendere*, to take). In international law, a means of securing redress without resort to war, but at the same time with the use of force. It consists in forcibly seizing from an offending nation property or its equivalent belonging to the aggrieved nation, or in detaining the property of an adversary with the intention of compelling it to afford the necessary redress. Reprisal is resorted to when a specific wrong has been committed and the seizure is by way of compensation in value for the wrong. The things seized are held subject to the termination of the controversy and are restored if the controversy is amicably settled. Reprisal is an act of retaliation and consists in applying to the subjects of an offending State treatment analogous to that which the subjects of the offended State have received. A reprisal, though an act of war in fact, is not such in intent, and, indeed, is resorted to as a means of avoiding war by securing redress without resort to the graver alternative, although it may constitute a sufficient cause of war. The forms of reprisal most commonly employed in recent times consist in placing an embargo on such ships of the offending State as may be lying in the harbors of the aggrieved State, or in the seizure of its ships

at sea of property within the jurisdiction of the State, whether belonging to the State or to private citizens. Bluntschli mentions in addition the following acts of reprisal as permissible by the law of nations: interruption of commerce, detention of subjects of the offending State as hostages, the expulsion or imprisonment of its subjects, refusal to be bound by treaty stipulations or other international agreements, and the withdrawal of privileges and protection to the subjects of the offending State. See BLOXTON.

REPRODUCTION (from Lat. *re*, back again, anew + *producere*, to produce, from *pro*, before + *ducere*, to lead). The fundamental property of the organic world essential in repairing losses by death and in maintaining the earth's population. Although at the outset the result of unknown causes, it consists in a separation of a part of the body of an individual from the parent body; division of a one-celled organism into two; or a giving off of an egg-cell or sperm-cell from the parent. (See CELL; MITOSIS.) Reproduction and growth are inseparable, and the former is the result of growth. As Verworn states, the general process that constitutes growth is an increase of living substance, and the essence of reproduction likewise consists merely in an increase of living substance. Reproduction differs from growth in that a part of the substance separates from the original organism. If the quantity of the living substance increases further by growth, this results in a "growth beyond the measure of the individual," and the cell must divide, i.e. reproduce. The different forms of reproduction are: (1) Self-division, secondary forms of which are (a) fission, and (b) budding or gemination; (2) conjugation; (3) sexual reproduction.

REPRODUCTION BY CELL DIVISION. This is the primary mode of reproduction. While that of plant and animal cells is called 'cell division,' that of the entire one-celled plant or animal is called 'self-division.' This has been observed in the amoeba and other Protozoa, as well as in the white corpuscles of the blood (leucocytes). See AMOEBÆ.

FISSION. Many of the lower invertebrate animals multiply by fission or budding. In fission the body, as in certain planarian and annelid worms, after having reached a certain size but not sexual maturity by ordinary cell division, is constricted into two or more parts. Each of these several parts separates and regenerates itself into an independent perfect worm. Fission or self-division occurs in fully grown examples of many-celled animals, as in certain polyps and starfish.

BUDDING OR GEMINATION. The process of reproducing the persons of a compound individual or colony. Buds are outgrowths of a parent person that enlarge while in connection with the parent to form a new person. In the case of budding the products are unequal. All the higher plants are produced by budding and are colonies. Among animals the process occurs in Protozoa, sponges, coelenterates, polyzoans, and tunicates. According to one view the Tapeworm is a colony whose parts are produced by budding; even segments or rings of an annelid have been considered as produced by budding. Indeed, as there is no sharp line drawn between growth of the simple individual and growth of a compound

individual, so no sharp line exists between ordinary development and budding; nor is there any definite distinction between cell division and division in the amoeba, and budding. This is seen in examples of terminal budding, when the buds appear at the end of the main axis of the parent organism, as in plants and certain Protozoa and low multicellular animals.

CONJUGATION. Though an anticipation of sexual reproduction, conjugation radically differs from it in the fact that two conjugating bodies are each an entire plant or animal. It occurs in the unicellular plants, such as diatoms and desmids, and in the Infusoria. Thus in the act of conjugation of a monad-like form (Heteromita) a free-swimming individual approaches an anchored form, the posterior ends coming in contact; they then fuse like two drops of syrup, the nuclei sharing in the fusion. The product swims around freely, then rests, loses its flagella, and becomes encysted, then bursts open at three angles of the cyst, pouring out a swarm of spores as the result of multiple internal fission. It is usually among the Infusoria a temporary process, but in *Vorticella* the fusion is permanent. The result of conjugation upon the species is to prevent its deterioration. It is a process of rejuvenation, comparable with the intercrossing of higher plants and animals.

SEXUAL REPRODUCTION. In the process, sometimes called 'amphigony,' of reproduction by means of sexual cells, two animals, the male and female, secrete in reproductive glands, one eggs, the other spermatozoa, the result being their union and the formation of a new individual. Here still more than in conjugation sexual reproduction results in a complete renewal or rejuvenescence of the organism. In those plants and animals which also reproduce by budding sexual reproduction arrests degeneration by the introduction of new blood. Sexual reproduction in animals is essentially the same in all classes above the Protozoa. There is a series of developmental processes embraced under the following heads: (1) Maturation of the egg; (2) the process of fertilization; (3) a process of cleavage or segmentation of the yolk (see MITOSIS); and (4) formation of the three germ layers. (See EMBRYOLOGY.) The essential phenomenon in the reproduction of the many-celled animals, i.e. all above the Protozoa, is the act of fertilization or impregnation of the egg. This is effected by the entrance of a single spermatozoon into the egg. After the spermatozoon has entered the egg the head and middle portion, which contains the body called the *centrosome*, can still be recognized as the chromatic and achromatic parts of the spermatozoon or sperm nucleus (male pronucleus). In the protoplasm of the egg (that enveloping the nucleus and called *cytoplasm*) the centrosome of the sperm nucleus gives rise to rays forming 'asters.' (See MITOSIS.) Preceded by these rays, the sperm nucleus travels toward the egg nucleus until it reaches and fuses with it to form a single cleavage nucleus. Then the centrosome divides into two, which migrate to opposite poles of the nucleus, while the cleavage nucleus changes to a cleavage spindle, which divides and thus initiates the embryonic development, the process being called cleavage or segmentation. At this point fertilization is complete (Hertwig). It also appears that of the chromatin particles

(chromosomes) in the newly formed nucleus of the fertilized egg, exactly one-half of the number are furnished by the egg nucleus and the other half by the sperm nucleus. These chromosomes are regarded as the bearers of heredity, forming the physical basis of heredity. See HEREDITY.

ASEXUAL AND UNUSUAL MODES OF REPRODUCTION. Budding and its various forms are examples of asexual reproduction. In certain insects and other animals the egg develops and gives rise to a mature individual without fertilization. (See ALTERNATION OF GENERATIONS; PARTHENOGENESIS.) Hertwig calls this sexual reproduction with degenerated fertilization. Different modes of reproduction (asexual, sexual, parthenogenesis, padoogenesis) may occur in the same species. The alternation of parthenogenesis with pronounced sexual reproduction is called 'alternation of generations,' or heterogony.

Consult: Hertwig, *The Cell* (New York, 1895); id., *Zoölogy* (ib., 1902); Wilson, *The Cell in Development and Inheritance* (ib., 1897).

REPRODUCTION (in plants). Although reproduction is a physiological phenomenon, it

in animals; the morphological aspect, however, deals with structures peculiar to plants. Two types of reproduction are recognized among plants, namely, *vegetative multiplication* and *reproduction by spores*.

(1) **VEGETATIVE MULTIPLICATION.** In this case the ordinary vegetative cells are used in reproduction. (Figs. 1, 2.) In the simplest plants the adult body consists of a single vegetative cell, and when this cell divides two new

FIG. 1. VEGETATIVE REPRODUCTION.

FIG. 2. VEGETATIVE REPRODUCTION IN A SAXIFRAGE.

Stolons are put forth, upon which there arise buds, capable of developing into plants like the parent.

is also a prominent morphological phenomenon in so far as it involves important structures. The physiological aspects are essentially the same as

plants are produced. The same power of cell division persists in all plants, but in the complex (many-celled) plants much of it results, not in reproduction, but in the growth of the body. In such plants, however, the power of vegetative multiplication continues, as when

new potato plants come from tubers (modified stems), or new grapevines from cuttings, or new begonias from pieces of a leaf, or when buds from one plant are grafted into the stem of another. In fact, vegetative multiplication is very conspicuous in most plants, enabling them to spread with comparative rapidity, as the strawberry spreads by means of its runners, or the couch grass by its root-stocks (underground stems).

(2) **REPRODUCTION BY SPORES.** A spore, in general, is a single cell designed for reproduction and separated from the parent plant. There are two great classes of spores differing not in function, but in origin: (a) *Asexual spores* (Figs. 3-5) are usually formed by the division of the contents of a mother cell (sporangium), although

FIG. 5. ASEQUAL REPRODUCTION. Germinating spores of a liverwort.

they are sometimes formed free by cell division at the tip of a special cell or filament. In many cases spores are provided with cilia and can swim freely in water; in others they are light and dry, and are carried by the wind. They are the most primitive spores, and are the only kind produced by many low plants; but they are retained even

by the highest plants, the pollen of flowering plants being an illustration. (See SPORE.) (b) *Sexual spores* (Figs. 6-8) are formed by the union of two sexual cells (gametes). In the first appearance of sex the pairing gametes are alike

(see the article SEX) and the fusing process (conjugation) results in a sexual spore (zygospore or zygote). When the gametes become differentiated into sperm and egg, as in all the higher plants, the fusing process is called fertili-

zation, and the resulting sexual spore an oöspore or fertilized egg. It is evident, therefore, that in most plants there coexist three means of reproduction, namely, vegetative multiplication, asex-

ual spores, and sexual spores, which are used under varying conditions, and reinforce one another in the general work of producing new plants.

REPRODUCTION OF IDEAS. It is customary to divide the 'act of remembering' into three parts: retention, reproduction, and recognition. (See MEMORY; RETENTION; RECOGNITION.) The reproductive aspect of memory refers to (1) the excitation of a brain-tract that has received a functional modification by previous excitation.

and (2) the appearance of the corresponding mental processes. The word 'reproduction' is misleading. First, because it implies the 'reappearance' of mental experiences which have persisted and have maintained their identity during their absence from consciousness. An examination of the processes of retention does not warrant the implication. Secondly, reproduction is often posited where no explicit reference is made to a past event at all. Thirdly, a 'reproduced' image is usually schematic; i.e. it contains only the outlines or salient features of its counterpart. The sole definite meaning left for the term 'reproduction' is the unequivocal appearance of 'revived' sensations; i.e. of centrally aroused sensations which possess the function of referring directly to a definite period of past experience. Even when it is thus taken, the concept must not be confused with the old 'copy' theory, which made ideas weaker duplicates of sensations.

The conditions under which reproduction of ideas takes place are various. In the associational psychology, the single condition of reproduction was said to be association. Ideas were 'called forth' by the magic of association. If, however, we conceive association to mean certain conscious complexes themselves, and not their cause, we cannot say that it *conditions* reproduction. (See ASSOCIATION OF IDEAS.) Association and reproduction will have a *common* cause. The 'law' of association will be, i.e., a law of reproduction and will be stated in terms of cerebral connections. This general statement does not help us, however, to name the incentives to the reproduction of any particular set of processes. For this, we must take into account the functions of attention, feeling, will, and mental constitution (e.g. one is apt to 'reproduce' visual imagery if one's attention is directed to visual things, or if one is visually minded, or if one's mood fits in with some particular scene), and the special conditions which are enumerated under association—frequency, recency, vividness, etc.—i.e. the proximate conditions which determine the relative liability of reproduction of ideas.

Finally, a comparison of peripherally initiated sensations with the 'reproduced' sensations contained in imagery makes it possible to measure both the power of reproduction and the fidelity with which sensations aroused without the co-operation of the sensory organs represent their 'originals.'

See authorities referred to under MEMORY; RETENTION; IMAGINATION; ASSOCIATION OF IDEAS, and for reproduction as an experimental method, see MEMORY.

REPRODUCTIVE SYSTEM, COMPARATIVE ANATOMY OF. The germ cells are not the only ones that are capable of increasing their numbers. This is a common property of all body-tissue cells, and by virtue of this fact the number of individuals may be increased by division of the body and subsequent regeneration (q.v.). In Infusoria no specialized reproductive organs are present. When the unicellular organism exceeds its size-limit, it divides into two parts or 'daughter cells.' (See REPRODUCTION; FISSION.) Reproduction of sponges is either asexual or sexual. Asexual reproduction, or budding, may

occur externally or internally. The sexual reproduction may be hermaphroditic or dioecious. Coelenterates are, for the most part, sexually separate, but some are hermaphrodites, as Ctenophora. There are no organs for the transmission of the sexual products to the exterior.

Sexual ducts occur for the first time in flat worms. In some the entire ovary produces eggs, while in other forms a part of the ovarian cell only produces egg cells and the rest, the 'vitellaria,' is so modified that it produces only yolk. Both the female and the male glands communicate with the exterior by ducts leading to the copulatory apparatus. The sexes are almost always separate in celinodermis. In one group (Synapta) of the holothurians hermaphroditism is frequent. There are no copulatory organs nor accessory glands. The general organs of starfishes develop in five pairs of bundles. One pair lies in each arm and each pair opens dorsally to the exterior by a separate opening.

In the mollusks the generative apparatus is composed of germ glands, ducts, and copulatory organs. The sexes are separate throughout the whole phylum. Hermaphroditism is, however, wide-spread. In nearly all cases of hermaphroditism both kinds of sexual products are produced in the same gland. The gonads either have separate ducts or utilize the nephridia. The genital glands open either (1) into the pericardium, (2) into some part of the kidney or uterus, (3) into the cloaca, or (4) directly to the exterior. When there are separate ducts they may be very complicated in structure. The structure of the copulatory organ and the form of the ducts with their accessory glands and tubules vary much in detail in the different species. The sexes are distinct in many of the annelids, but Hirudinea, Oligochaeta, and some others are exceptions. The sexes of Polychaeta are separate with a very few exceptions. The ovaries or testes are segmentally repeated several or many times. The ripe eggs and sperm float in the colomic cavity, to be picked up and discharged to the exterior by the nephridia, or by nephridia specially modified into genital ducts.

The sexes are separate in Crustacea except in a few cases. The male and female sexual glands are constructed on the same plan and have a similar position in the body. There is only one pair, and in certain species only one gland. The parts that make up the sexual apparatus are as follows: (1) The genital organs (ovaries and testes); (2) ducts (oviducts, vasa deferentia); (3) terminal parts (vulva, vagina, and receptaculum seminis in the female, and ductus ejaculatorius in the male); (4) outer copulatory organs. Except in Cladoceera and some Copepoda the genital apertures are situated on the ventral side. In all hexapods they open at the end of the abdomen. In certain species there are glands whose secretion unites the sperm cells into capsules or spermatophores. A penis may also be present. The female apparatus may possess a receptacle for the penis and another for storing the sperm. The testis and ovaries consist of a varying number of long tubes which together enter the vasa deferens or oviduct. The ovarian tubes are of two kinds, those with and those without nutritive cells. The nutritive cells may alternate with the egg cells, or they may be collected in a bunch and furnish nutritive material to the egg cells by means of fine constricting strands. Coming to

the Chordata, we find that in *Balanoglossus* the sexes are separate, and the ovaries and testes are a row of saucer-like organs which open to the exterior by a series of pores, or, in the American species, by rupture. Tunicates are hermaphroditic.

In *Amphioxus* the sexes are separate. The sexual organs are horse-shoe-shaped sacs which lie in 26 pairs and without ducts. The ova and spermatozoa burst the atrial cavity and reach the exterior by means of the atropore. The sexes of the lamprey are separate and the sexual organ is unpaired. The sexual products pass into the body cavity and thence to the exterior by two pores into the urinogenital sinus. There is a penis in the male.

In fishes, impregnation is internal in all the sharks except the Greenland shark. The claspers act as intromittent organs. With a few exceptions, such as the dogfish, there are two ovaries and the oviducts are separate from the ovaries. The oviducts, the Müllerian ducts, are united anteriorly and open into the body cavity. The eggs are extruded into the body cavity and then pass into the oviducts. There is a large shell gland in the oviduct. The majority of fishes lay eggs that are fertilized outside the body. Most sharks and a few teleosts are viviparous, the eggs being hatched in the oviduct or ovary. In two of the sharks the yolk-sac and the wall of the oviduct are united, suggesting the placenta of mammals. The ovaries of teleosts are continued backward into a duct. Posteriorly the two ducts fuse. The oviducts of the Dipnoi are somewhat coiled, like those found in Amphibia; each connects with the body cavity near the pericardium by means of a funnel-shaped aperture. Hermaphroditism is not uncommon throughout the Teleostei.

REPTILES AND BIRDS. The ovaries are broad in the turtles, and long and narrow in snakes and elongated lizards. The ovaries are usually asymmetrical. Only the left ovary is completely developed in birds. The oviducts open into the abdominal cavity by wide funnel-shaped apertures and in the walls of the ducts are glands for the formation of albumen and egg-shells. The ovaries, like the testes, increase in size during the breeding season. In birds the vas deferens, like the ovaries, opens into the cloaca by an independent aperture. In lizards it fuses with the ureter. There is a copulatory organ in reptiles; in birds it exists only in the ducks, geese, and Ratitæ.

The genital apparatus of mammals lies in the lumbar and pelvic regions. When the ova are mature they pass into the body cavity or are immediately caught up by the funnel-shaped opening of the oviducts. This portion is known as the Fallopian tubes. In the majority of mammals the oviducts fuse behind the Fallopian tubes to form the uterus. It is in the uterus that the ova attach themselves to the maternal tissue and develop. The fused region behind the uterus is known as the vagina. In monotremes the Müllerian duct remains distinct and there is a cloaca. In mammals the Müllerian duct begins to fuse to form the vagina. In most other mammals an anterior tubercle of the pericervix of the uterus occurs. The degree of fusion varies in different species. In Primates the only evidence of the paired origin is seen in the Fallopian tubes. The testes of mammals develop in the same position as the ovaries, but they later pass out of the abdominal

cavity through an opening in the latter known as the inguinal canal, and descend into the scrotal sacs; but in many mammals the testes remain permanently in the abdomen.

External genital apparatus exists as follows: In elasmobranchs there are male 'claspers' which are inserted into the cloaca and oviduct of the female. In connection with them there is a gland which is histologically much like the uropygial glands of birds. In Amphibia the male of *Gymnophiona* alone possesses an eversible cloaca. In lizards and snakes there are two erectile penes outside the cloaca. Each is furrowed. Organs of similar nature, but much less developed, occur in the female. Chelonians and crocodyles have a copulatory organ united with the ventral wall of the cloaca. It is made up of two fibrous fused masses, and, as in the above copulatory organs, is regulated by well-developed muscles. There is a furrow on its surface. The female also has a median, less well developed organ of the same character. In most Ratitæ and some Carinate there is an eversible tube strengthened by two fibrous bodies. When at rest it is coiled up in the left side of the cloaca. The copulatory organ of monotremes lies between the urinogenital sinus and the cloaca, and is fused with the ventral wall of the latter. In all other mammals the organ arises on the ventral wall of the cloaca. In the female it is channeled. In the male the groove is closed to form a canal. Three bodies of erectile tissue are developed in connection with the penis of man. The greater part of one of these glands occurs at the apex of the penis and is known as the glans penis. The clitoris of the female is the homologue of the male penis.

Consult: Lang, *Text-Book of Comparative Anatomy* (London, 1891-96); Wiedersheim, adapted by W. N. Parker, *Comparative Anatomy of Vertebrates* (London, 2d ed., 1897).

REPTILE (Lat. *reptile*, neu. sg., sc. animal, animal, from *reptilis*, crawling, from *reperere*, to crawl; connected with *serpere*, Gk. *ἔρπειν*, *herpein*, Skt. *sarp*, to creep). A cold-blooded vertebrate animal of the class Reptilia, breathing by lungs and having a single median occipital condyle. In their larger, phylogenetic relationships, reptiles occupy a central position, but are closely in affinity with birds, so that the two classes were united by Huxley into a group, Sauropsida, in distinction from the Mammalia and from the Ichthyopsida, or amphibians and fishes. "On the one hand," Gadow asserts of the reptiles, "there is not the slightest doubt that they are evolved from some branch of the Stegacephali, whilst on the other hand the reptiles, probably through some branch of the Theromorpha, have given rise to the mammals; some other reptilian branch, at present unknown, has blossomed out into the birds."

CLASSIFICATION. The history of the development of the ideas on the classification of reptiles is given under HERPETOLOGY (q.v.). The arrangement by Parker and Haswell is as follows:

Class REPTILIA:

Order I. Squamata.—This includes the Lacertilia (lizards), Ophidia (serpents), and Pythomorpha (extinct snake-shaped forms, with paddle-like limbs and lizard-like skulls).

Order II. Rhyncocephalia.—Lizard-like reptiles, often huge, scaly, with walking limbs; vertebræ amphicealous; sacrum composed of two

vertebræ; teeth aerodont. This order has one living genus (*Sphenodon*).

Order III. *Chelonia*.—The turtles (q.v.).

Order IV. *Theromorpha*.—Sacrum composed of six vertebræ, limbs adapted for walking, four suborders: *Anomodontia*, *Placodontia*, *Parciasauria*, *Theriodontia*—all extinct.

Order V. *Crocodylia*.—Crocodiles and alligators.

Order VI. *Sauropterygia*.—Extinct aquatic reptiles with a very small head, elongated neck, limbs usually flipper-like, and teeth in separate sockets.

Order VII. *Ichthyopterygia*.—Extinct aquatic reptiles with large head, no neck, long tail, flipper-like limbs, naked skin, and teeth lodged in a groove.

Order VIII. *Dinosauria*.—Extinct terrestrial reptiles, skin naked or armored, pelvis bird-like, teeth in sockets. See *DIXOSAURIA*.

Order IX. *Pterosauria* (pterodactyls).—Extinct aerial reptiles, with long neck, sacrum composed of two or three vertebræ, skull bird-like, sternum present, fore limbs wing-like, and teeth in sockets.

An advance upon this, resulting from larger knowledge of fossil forms, has been educed by Boulanger and Gadow, so that the most complete classification now stands as follows:

Class REPTILIA:

Sub-Class I. *Proreptilia*.

Sub-Class II. *Prosauria*.—Orders: *Microsauri*, *Prosauri*.

Sub-Class III. *Theromorpha*.—Orders: *Parciasauria*, *Theriodontia*, *Anomodontia*, *Placodontia*.

Sub-Class IV. *Chelonia*.—Orders: *Athece*, *Thecophora*.

Sub-Class V. *Dinosauria*.—Orders: *Sauropoda*, *Theropoda*, *Orthopoda*, *Ceratopsia*.

Sub-Class VI. *Crocodylia*.—Orders: *Pseudosuchia*, *Parasuchia*, *Eusuchia*.

Sub-Class VII. *Plesiosauria*.—Orders: *Nothosauri*, *Plesiosauri*.

Sub-Class VIII. *Ichthyosauria*.

Sub-Class IX. *Pterosauria*.

Sub-Class X. *Pythonomorpha*.—Orders: *Dolichoauri*, *Mosasauri*.

Sub-Class XI. *Sauria*.—Orders: *Lacertilia*, *Ophidia*.

The term sub-class is given to the larger subdivisions "to emphasize the fact," says Gadow, "that these reptilian groups are of undeniably greater morphological value than those which are generally called 'orders' in the Mammalia." This author tries to display their supposed evolutionary phylogenetic relations by the following scheme:

The earliest fossil reptiles are found in the Permian age. Reptiles attained their highest development in Jurassic and Cretaceous times, when

many were of gigantic proportions, and ruled the world. Since then the order has waned, only the recent and adaptive line of snakes seeming to flourish and promise continued prosperity at the present time.

CHARACTERISTICS. With the exception of modern chelonians and ancient dinosaurs, the reptiles in general are of an elongated form, the body being often nearly cylindrical and usually terminating in a very long tail. In a considerable number (as most serpents and some lizards) no traces of limbs are apparent; in some (as certain lizards) the limbs are rudimentary; while in the remainder the limbs are fully developed, although the feet rarely suffice to keep the belly from the ground. The feet are of the pentadactyl type, but not always five-toed.

The covering of the body presents several well-marked varieties. In a few of the lizards the skin is covered with regular scales, composed of a mixture of bony and horny matter, and lying over each other like those of fishes; in most lizards and in serpents scales and plates are developed on the surface of the corium or true skin, and covered over with epidermis, which is thrown off at intervals, the molt forming an accurate cast of the body of the animal; while in the crocodiles and tortoises the scales are converted into true bony plates, which in the former are imbedded in the tissue of the skin, and in the latter are united with the ribs, sternum, and other bones of the internal skeleton, to form the complete bony case into which the head and limbs of the animal can usually be retracted. See *SKELETON*, paragraph *Exoskeleton*.

The skeleton is completely ossified in all reptiles. The skull is small, loosely united, and articulates with the atlas, as in birds, by one condyle, which is formed mainly by the basioccipital. There is an auditory columellar apparatus within the fenestra ovalis, as in Amphibia. The mandibles consist of many pieces, and articulate with the cranium through quadrate bones—one of the principal characters separating this class from the mammals.

The mouth, except in the chelonians, is usually provided with conical teeth, adapted rather for seizing and holding prey than for dividing and masticating food. These teeth, like those of fishes, are successional; that is to say, new teeth are being constantly developed, while the older ones are regularly shed. (See *CROCODYLE*.) In some instances the teeth are attached solely to the jaws, while in others they are also attached to the pterygoid or palate bones. In chelonians the teeth are replaced by a horny beak, which, according to the habits of the animal, is adapted for bruising as well as cutting, and which in some species constitutes a somewhat formidable weapon.

The vertebræ, like those of other Amniota, are 'gastrocentric,' that is, their centra "are formed by the pairs of intercentralia, while the basicalia are reduced" or lost altogether; this characteristic separates reptiles wholly from amphibians. The total number is often great, especially in serpents and the tail of the lizards. The ribs form a true sternum, and the ilio-sacral connection is post-acetabular; the former of these characters separates reptiles from amphibians and the latter from mammals. Reptiles are mainly carnivorous, and swallow their prey whole. Hence the

are adapted, by their mobility and subdivision into segments, to open very widely, and the osophagus is capable of great dilatation. The tongue is commonly free, elongated, and bifid, except in the crocodiles, in which it is immovable, whence the popular idea that these animals do not possess this organ. The stomach is sometimes scarcely larger than the osophagus and intestines (as in serpents), while in other cases it forms a sac of considerable size. In either case it is capable of great dilatation. A liver, pancreas, and spleen are always present, the two former pouring their secretions into the upper part of the intestine, which is short, wide, and not much twisted, and divided into two portions, corresponding to the small and large intestines of mammals, by a valve. It finally terminates in a wide cloaca, into which the ducts of the urinary and generative organs usually open. The kidneys differ from those of amphibians, and agree with those of birds, in having no nephrostomes, and in having each its one separate ureter. See ALIMENTARY SYSTEM, EVOLUTION OF.

Reptiles breathe air only by means of lungs, and never have gills even during embryonic life. The lungs are usually of large size; but as they are not subdivided, as in mammals and birds, into innumerable microscopic air-cells, the real aerating surface is comparatively small. In several groups they are merely capacious bags, whose vascular or aerating surface is but slightly increased by sacculi developed in their cells. In serpents one lung (usually the right one) is of extraordinary length, while the other remains altogether rudimentary. This inferiority of the respiratory apparatus of reptiles is further shown in the absence of those means for the continuous introduction and expulsion of air possessed by birds, and still more by mammals. See RESPIRATORY SYSTEM, COMPARATIVE ANATOMY OF.

This feeble respiratory system is correlated with the absence of any covering, such as hair or feathers, which might retain the bodily heat generated by the oxygenation of the blood, as is the case in the well-clothed birds and mammals; hence the blood remains at a temperature little above that of the air or water in which these animals live, and reptiles are placed with the similarly naked or scaly amphibians and fishes as 'poikilothermous' or 'cold-blooded.' (See ANIMAL LIFE.) The heart, unlike that of a bird or mammal, is divided into two atria, and an imperfectly divided ventricle; it has no conus, but semilunar valves exist at the base of the tripartite aortic trunk; the right and left aortic arches are complete and remain functional. The red corpuscles of the blood are nucleated, biconvex and oval—a point of distinction from mammals.

The brain and nervous system present no peculiarities calling for special remark; the presence of an intercranial hypoglossal nerve separates this class from the amphibia. The organs of the senses are well developed, but there are no lateral sense organs. No reptiles have external ears, but their hearing is good. See NERVOUS SYSTEM, EVOLUTION OF.

The sexes are always separate; and the male generative organs, which are far more highly developed than in amphibians, present peculiarities which, in association with the position of the anal aperture, have been adopted by zoologists as a basis of classification of special taxonomic value

among the Ophidia. Fertilization is always internal, and most reptiles lay *microblastic eggs*, from which the young hatch quickly under the influence of the warmth derived from the hot sand or decaying vegetation in which they are buried by the mother, or, in a very few cases, by her incubation. The eggs are comparatively few (except in the turtle tribe), and relatively large, containing a large quantity of food-yolk, so that the young are able to take care of themselves the moment they emerge; yet in most cases they receive some parental care. The integument of the eggs is parchment-like, containing little lime, and the color is always white. Certain reptiles, however, retain their ova in a sort of uterine cavity, formed by a dilatation of the oviduct near its termination in the cloaca, until the development of the embryo is so far advanced that the enveloping membrane bursts previously to the expulsion of the ovum, so that the young are actually born alive—a mode of generation to which the term 'ovoviviparous' is applied. An amnion and an allantois are formed in the process of development, allying reptiles with birds and mammals. See REPRODUCTIVE SYSTEM, COMPARATIVE ANATOMY OF.

In past times reptiles have dominated the earth, swarming in the seas, along the shores, on the land, and in the air. They reached huge size, and many were herbivorous, and preyed upon by others which, as they increased in size and power, must have been the principal active agency in the extermination of the fishes, amphibians and great cuttlefishes, which previous to the Mesozoic Age were the dominant animals of the earth. The alterations of physical conditions, which seem to have progressed steadily during the Mesozoic Age, toward dryness and coolness in the atmosphere, as well as toward elevation and drainage of the land, and the gradual increase of density (salinity) in the sea, were probably unfavorable to the reptilian forms of that time, both directly and indirectly, by being likewise unfavorable to the creatures upon which they fed. On the other hand, the growing clarification of the atmosphere consequent upon the draining and elevation of the land and the spread of terrestrial vegetation, which subtracted its excess of carbonic acid gas and contributed a larger amount of oxygen, stimulated the development of superior types which began in the Permian and slowly won their way in competition with the dinosaurian and other reptiles of their day until they finally overcame them in importance. That they were enabled to do so was due principally, no doubt, to their warmer covering (feathers and hair), enabling them to retain bodily heat, which gave them greater endurance of famine and climatic adversities, and promoted activity, which, in turn, reacted to stimulate and develop all the bodily parts and functions. At any rate the reptiles have steadily declined, many of their branches have become extinct, and others are approaching that end, while all have been driven by competition to the holes and corners of the world, to hiding in swamps, or amid loose rocks, or in hollow trees or among their leafy tops—places where their many enemies cannot easily get at them. Only the heavily armored turtles and crocodiles are able to survive freely in the water, land-tortoises existing only by being very small, well protected, and secretive; and lizards only by having diminished to small size and acquired

great agility. The only branch of the class that seems to be prosperous is that of the snakes, whose peculiar form, adaptive qualities, and excellent endowments for escape or defense enable them to fill a peculiar and little-contested place in the economy of the world.

FOSSIL FORMS. The living reptiles are comparatively insignificant survivors of a mighty race, whose first appearance antedates the Permian period, since remains of two widely dissimilar groups occur in Permian rocks in Europe, North America, and South Africa. First becoming abundant in the Triassic, the rise of reptiles is coincident with the decadence of the Stegocephalia, the great armored amphibians. In the Jurassic the development of reptiles attained its highest level; they dominated land, sea, and air in forms as grotesque as the mythical griffon, dragon, and sea-serpent. It is noteworthy that the Mesozoic reptiles paralleled nearly all the adaptations which occurred ages later among the mammals. There were land reptiles of carnivorous habit, like the cats and wolves, heavy sluggish animals adapted to vegetable feeding, marine fish-like forms which strongly suggest the whales and porpoises, others which sat erect on the hind legs and tail, in some cases adapted to leaping like the kangaroo, and even 'dragons of the air' with bat-like wings. The supremacy of the reptiles extends into the Cretaceous with scarcely any diminution; in fact, it is here that several orders reach their culminating point; but toward the end of this period the dynasty of reptiles comes to an end, and at the dawn of the Eocene the mammals, which during the Mesozoic were extremely insignificant, become the reigning type.

Geographically, the reptilian fauna of the Mesozoic period was almost cosmopolitan, although the contemporary faunas of widely separated regions sometimes show considerable dissimilarity. This variation may be due to different climatic conditions, or to causes which prevent migration of animals. Regarding the general geological distribution of reptiles, it may be stated that the Karoo formations (chiefly Lower Triassic) of South Africa have yielded the anomodont land reptiles in remarkable numbers and diversity of form, while the Middle Trias and the Jurassic of Europe are especially rich in marine forms. Above the Triassic no land-reptiles are known for the Southern Hemisphere, the anomodonts having become extinct, but the northern continents, and especially North America, witnessed during the Jurassic and Cretaceous the development to gigantic size of ichthyosaurs, plesiosaurs, turtles, and especially dinosaurs. The pterodactyls attain huge proportions in the American Cretaceous, and here for the first time appear the great sea-lizards or mosasaurs. It is certain that the true lizards, and probably snakes, existed in the Cretaceous, but as yet only a few doubtful remains have been discovered below the Eocene. None of the reptilian orders except those which exist at the present survived the Cretaceous, and the beginning of the Eocene witnessed a reptilian fauna essentially similar to that of to-day.

The origin of reptiles from stegocephalian Amphibia cannot be doubted; and as the earliest known reptile, palaeohatteria, from the Lower Permian of Saxony, is already well differentiated from its stegocephalian contemporaries, it seems

probable that reptiles existed as early as the Upper Carboniferous. Some of the Microsauria, a sub-order of stegocephalians, are ranked by Gadow as reptiles. It is not improbable that the reptiles arose diphyletically, or in two parallel lines, from the Amphibia, and as far back as the Permian we find the widely divergent stems of the two great divisions of the order. On late years the diphyletic character of the class has been noted by several writers, but it was not until 1902 that the two branches of reptilian descent were clearly differentiated by Osborn as sub-classes, under the names *Synapsida* and *Diapsida*. These names refer to the condition of the temporal region of the skull—whether primitively a single temporal arch, or separate upper and lower arches.

See special articles elsewhere in this work under the names of groups above mentioned, as DIXOSAURIA, ICHTHYOSAURUS, THEROMORPHA, etc.

REPUBLIC. A form of political organization in which the principal agents of government are chosen by qualified electors, to whom they are, in theory at least, responsible. Such electors may comprise the whole adult population of the State, or all qualified male citizens, or a small group of persons exercising a constitutional or hereditary power of election. The earlier republics were of the latter sort, ranging from the free but limited democracy of Athens to the narrow oligarchies which divided the sovereignty of Italy during the Middle Ages. The democratic movement of the last century has, in the freer political communities of the Western world, largely substituted a popular for an oligarchical electorate, thus giving to the world republics of the type of France and the United States of America, and creating a new but inaccurate definition of republic as synonymous with popular government. See DEMOCRACY.

It is not to be denied that there may be a republic in reality which is not such in name, nor that a government which masquerades under republican forms may in fact be a thinly disguised monarchy or imperialism. In limiting the term republic to the form of government, we must be understood as speaking of the form through which government is actually administered. A monarchy in which the crown has become merely the symbol of social distinction and no longer represents political authority may fairly be described as a republic in all but name; while a military autocracy, like that of the Caesars, though veiling its assumption of arbi-

that we find in republican forms, is none the less a fact. That the English government is passing according to the former condition, and that the arbitrary despotisms of Central America are, almost everywhere, near the latter, cannot be denied. It is, therefore, not rash to say that in either case the conversion of the government from the one type to the other has yet become complete.

It is to the growing realization of this fact—that a republican form of government furnishes no guarantee against tyranny, and that monarchy is not inconsistent with a high degree of political freedom—even more than to the conservative reaction of half a century ago, that we must attribute the change in the character and aims of the liberal movement of the last century. The widespread republican sentiment which in 1848 threatened the thrones of Continental Europe has completely died out, and in its stead we find a growing sentiment for the liberalization of the monarchical institutions which survived that revolution. England has taken the place of the United States and Switzerland as the model of political reformers, and the aim is rather to transform existing institutions than to abolish them and substitute others of the republican type.

Attempts have been made, but without much success, to classify republics according to the extent to which popular power was diffused through the mass of the people. A more valid and useful distinction among governments of the republican type is found in the form in which the popular choice, whether wide or narrow, expresses itself, and this is determined not so much by political theory as by considerations of practical convenience. From this point of view republics fall into two classes, the pure and the representative. The former, illustrated in the local town government of New England, as well as in the Athenian democracy and the early Swiss republics, was strictly a government of the people by the people, all the citizens—a small and select class in Athens, the whole body of freemen in Appenzel and Schwiz—actually taking part in the administration of the State. This form of government is, from the nature of the case, limited to small and compact communities, with simple and common interests, and does not lend itself to the solution of vast and complex problems of government. It is obviously unsuited to the great modern State, with its large population, varied interests, and extensive dominion. For a republic of this type there is no alternative but the adoption of the representative form of government. This is the indispensable condition of the existence of republics of the modern type.

Most of the leading writers on governments have treated the republic as a recurring but merely temporary stage in the cycle of political growth and decay, which moves from the stability of orderly monarchy, through oligarchy, democracy, and anarchy, back to despotism. But the conditions of modern life and the problems of modern government are so different from those of old that the reflections and prognostications of Aristotle, Polybius, Machiavelli, and Hobbes may safely be disregarded by us. What is certain is that democratic government everywhere, but especially in its republican form, calls for character as well as a highly developed political instinct in the mass of the people constituting

the State; and when these conditions exist we may reasonably believe that, in a world which has come to cherish industrial rather than militant ideals, the popular republic may have a stability, a good order, and a capacity for progress which no other form of government has yet displayed. See CABINET; CONSTITUTION; CONSTITUTION OF THE UNITED STATES; DEMOCRACY; GOVERNMENT, and the authorities there referred to.

REPUBLICAN METHODIST CHURCH.
See METHODISM; O'KELLY, JAMES.

REPUBLICAN PARTY. In the history of American politics the term Republican has been applied to political organizations representing the most diverse principles. During the years 1791-92, under the leadership of Jefferson, the opponents of centralization in the National Government were molded into an effective political party, which assumed the official name Democratic-Republican, though its members generally called themselves Republicans. Later this organization became known as the Democratic Party (q.v.). During the years 1825-29 the followers of Clay and of Adams were known as National Republicans. (See WHIG PARTY.) In ordinary usage, however, the term Republican is applied to the powerful party which was organized in 1854-56 and elected Lincoln in 1860.

The present Republican Party took its rise from one overpowering impulse—opposition to the extension of slavery. Northern Whigs acceded with great repugnance to the new Fugitive Slave Law of 1850 (see COMPROMISE of 1850), and its enforcement became daily more odious. When the Kansas-Nebraska Bill (q.v.) became a law the revolt was instantaneous. On the very morning after the passing of this bill, May 27, 1854, a gathering of some thirty Congressmen discussed the necessity of organizing a new party, and it was agreed that 'Republican' would be its appropriate name. Previously, on February 28, 1854, a mass meeting of Whigs, Democrats, and Free Soilers, in Ripon, Wis., had resolved that if the Kansas-Nebraska Bill should pass, they would "throw old party organizations to the winds, and organize a new party on the sole issue of the non-extension of slavery." Three weeks later local organization was effected, and the name 'Republican' was suggested as the one which the party should and probably would adopt. It was in Michigan, however, that the fusion of the opponents of the extension of slavery first completed a State organization, and formally adopted the name (July 6, 1854).

The new party was formed not so much by a coalition as by a fusion of diverse elements. There were: (a) a large proportion of the anti-slavery Whigs, like Seward, Greeley, and Lincoln; (b) the Free Soilers (see FREE SOIL PARTY), like Hale, Julian, and Sumner; (c) a great body of Know-Nothings, like Wilson, Banks, and Colfax; (d) some Abolitionists, who, though impatient with the Republicans' repeated assertion that they did not purpose to interfere with slavery where it actually existed, nevertheless found in the new party the best promise of effective opposition to slavery; and finally (e) anti-slavery Democrats, such as Hamlin, Cameron, and Bryant, who brought with them a strong popularizing influence. Later the war crisis led other Democrats into the Republican ranks, though in some in-

stances, as in the cases of Butler and Johnson, their allegiance was but temporary.

Before the new party had been in existence a year it had secured a popular majority for the opponents of slavery in 15 of the 31 States, and had elected 11 United States Senators and a plurality in the House of Representatives. The first Republican national convention met at Philadelphia, on June 17, 1856, and was attended by delegates from all the Northern States, from the Territories of Minnesota, Nebraska, and Kansas, from the District of Columbia, from Virginia, and from the border States of Delaware, Maryland, and Kentucky. The nomination for the Presidency was given to John C. Frémont, whose career as an explorer and pioneer made him a magnetic leader. The platform declared it to be "both the right and the duty of Congress to prohibit in the Territories those twin relics of barbarism, polygamy and slavery;" it demanded the immediate admission of Kansas as a free State, and denounced the Ostend Manifesto (q.v.), "with its highwayman's plea that might makes right." Whig influence was apparent in its strong declaration in favor of internal improvements at national expense, including the construction of a railway to the Pacific. Frémont obtained 114 electoral votes (Buchanan, the Democratic candidate, receiving 74), and polled a popular vote of 1,341,264, carrying all the free States with the exception of New Jersey, California, Pennsylvania, Indiana, and Illinois. (See ELECTORAL VOTES and UNITED STATES, section *History*, for details on Presidential elections.) A slight falling off in Republican strength in Congress reflected the waning of the first enthusiasm and the defection of some of the least disinterested members, but their places were soon more than filled by new adherents from the shattered American Party and from Whigs and Democrats, to whom the Dred Scott decision and the Leecompton Bill were intolerable. During Buchanan's administration the Republicans devoted their efforts to protesting against the extension of slavery, and to unsuccessful attempts to secure the passage of a Homestead Bill and the appropriation of public lands for educational purposes. In 1860 the Republican national convention was held in Chicago. The platform denounced Democratic threats of disunion; insisted that the rights of the States should be maintained inviolate, especially the right of each State to order and control its own domestic institutions according to its own judgment exclusively; declared that "the normal condition of all the territory of the United States is that of freedom, which Congress is bound to preserve and defend;" demanded the prompt admission of Kansas as a free State, and the passage of a Homestead Bill; favored a protective tariff, and river and harbor improvements; and advocated a Pacific railway, to be aided by national grants. In the balloting for candidates the more prominent leaders, Seward and Chase, were soon passed over as having made too many enemies or aroused too great apprehensions, and on the third ballot the nomination fell to Lincoln, largely from considerations of 'availability,' for as yet the full measure of his strength had by no means been revealed. Governor Hamlin, of Maine, a former Democrat, was given the second place on the ticket. Out of the 303 electoral votes Lincoln received 180, and his plurality was nearly 500,000; but his strength

was exclusively in the North, and his vote fell far short of a majority.

Republican rule began even before Lincoln's inauguration, for in the closing months of the 30th Congress the withdrawal of Southern members gave the Republicans a majority in both Houses, a fact promptly signalized by the admission of Kansas, and by the passage of a protective tariff act. The conduct of the war against the Confederate States was thrown into the hands of the loose constructionist Republican Party; yet the opposition, especially in the later years of the conflict, was vigorous. The chief war measures were enacted by Republican votes, and favorite Republican policies were also brought to realization in the Homestead Bill of 1862, and the grants in aid of railways and of education. Really 'pivotal,' however, was the party's policy toward slavery. Here Lincoln himself took the lead. The preliminary Proclamation of Emancipation (q.v.), issued upon his own responsibility, served to "unite the South and divide the North." Formidable reaction followed, and in the autumn elections of 1862 the very existence of the Union was at stake. No one could doubt that the loss of Republican ascendancy would result in the ending of the war by some compromise which would involve the dissolution of the Union, yet the great States New York, Pennsylvania, Ohio, Indiana, and Illinois all showed Democratic majorities; but the New England States, Kansas and Minnesota, California and Oregon followed the President's leading, and the border States, too, came to the support of his policy. In the resulting Congress the Republicans found themselves in control by a majority of about twenty votes. Lincoln's policy had been vindicated; he had been clear-sighted enough to recognize that the moment had come to commit the party to an aggressive policy, and on a question of right and wrong he had been willing to trust the people. But nothing less than an amendment to the Constitution could be relied upon actually to abolish slavery forever. Such an amendment was proposed in December, 1863, but went over to the next session, and therefore became one of the vital issues of the campaign of 1864. Lincoln insisted that the advocacy of such an amendment should be made the 'keystone' of the platform. In sharp contrast with the resolutions of 1860, the Republican Convention now declared that slavery was the cause and the strength of the rebellion; that it was "hostile to the principle of republican government," and that "the national safety demanded its utter and complete extirpation from the soil of the Republic;" that the Constitution should be so amended as to "terminate and forever prohibit the existence of slavery within the limits or the jurisdiction of the United States;" and that no terms but unconditional surrender should be granted to the rebellious States. Lincoln was re-nominated by acclamation, and, as a mark of recognition of the patriotism of the loyal men of the border States, the nomination for the Vice-Presidency was given to Andrew Johnson, of Tennessee. Lincoln's vote in the electoral college exceeded that of his Democratic opponent, McClellan, ten to one, yet it is significant that his popular majority was less than 500,000. January 28, 1865, with the aid of eleven Democratic votes, the joint resolution (v. Amend. XIII, U. S. Const.) was passed by the House.

The end of the war found the Republican Party strong and united. But a severer test awaited it in the problem of reconstruction (q.v.), and but a few weeks were needed to show how irreparable a loss the party had sustained in the death of Lincoln, and what a wretched blunder, from a purely Republican point of view, it had committed in making it possible for a strict-constructionist Democrat of Johnson's personality and antecedents to become President. During Johnson's administration the Republican majority in both Houses of Congress was overwhelming. Between the President and Congress there speedily arose over the policy to be pursued in reconstructing the South a controversy which culminated in the unsuccessful impeachment. The party in its platform of 1868 sanctioned the reconstruction policy of Congress, and insisted upon "equal suffrage to all loyal men in the South." General Grant received the unanimous nomination for the Presidency. His election was made a certainty by the fact that in the South negro suffrage was protected by Federal arms, while many of the whites were still disfranchised. Consequently only four of the Southern States, Delaware, Maryland, Kentucky, and Louisiana, chose Democratic electors. Republican majorities were maintained in both branches of Congress throughout Grant's first administration, although the opposition was gradually gaining strength. As a party measure the ratification of the Fourteenth and Fifteenth Amendments was exacted from Mississippi, Texas, and Virginia as a condition precedent to readmission, and the appointment of Federal supervisors of elections was authorized. Stimulated by protests against the manipulation of office for private or party purposes, the Republicans passed the first law for the reform of the civil service. The growing sentiment in favor of universal amnesty, universal enfranchisement, civil service reform, and the limiting of the power of the Federal Government over the local affairs of the States led to the breaking away of the Liberal Republicans (q.v.), who in 1872 made these the chief planks in their platform. Their avowed failure to come to any agreement as to the tariff, and their ill-advised nomination of Greeley, made the movement but a slight menace to the reelection of Grant, whom the Republicans had unanimously renominated upon a platform consisting chiefly of a glorification of the party's past achievements and strongly advocating a protective tariff. As a result of the *Crédit Mobilier* (q.v.) and other scandals the feeling became widespread that the Republican Party's long tenure of office had lowered the ethical tone of the party, and had given it into the hands of self-seeking and overbearing leaders. Moreover, the Republicans, as the party in power, were held responsible for the panic of 1873. Hence defection grew to such an extent that many of the Northern States were carried by the Democrats, who in 1875 secured a majority of 182 to 110 in the House. The Republican national convention in 1876 endorsed civil service reform, and commended the provision already made for the resumption of specie payments. The nomination for the Presidency was given to Governor Hayes of Ohio, and in the ensuing campaign many of the Liberal Republican bolters returned to their former allegiance. The result of the election was long in doubt, but by the Electoral Commission (q.v.) all the questions at issue were decided in

favor of Hayes, who was declared to have received 185 votes to 184 for Tilden, his Democratic opponent.

With the administration of Hayes there began a new period in the history of the Republican Party. The issues which had called it into existence had passed away, and the withdrawal by the President of the Federal troops from the South at the beginning of his administration may be said to have closed the strife between the two sections of the country. The old party leaders had left the field, for the most part, and their places had been taken by such men as Blaine, Garfield, Conkling, Sherman, Schurz, Hoar, and Edmunds. The task which faced them was new, for economic problems upon which neither party had developed well-united views had become dominant: the currency, the tariff, and commercial relations were to be adjusted to the new and rapidly expanding industrial life of the people. In the first two years of Hayes's administration the Democrats were in control of the House, and in the last two years of both branches of Congress, while from the members of his own party the President received but half-hearted support, for it was by the aid of Republican votes that the Bland Silver-Purchase Bill was passed over his veto, and that the further retirement of United States notes was forbidden. The Republican convention of 1880 favored a protective tariff, Federal aid to popular education, "the protection of the honest voter at the South," and thorough civil service reform. Grant was for a time the leading candidate, but after a long contest the convention was 'stampeded' for Garfield, who was nominated on the thirty-sixth ballot. In order to conciliate the supporters of Grant, the second place on the ticket was given to Chester A. Arthur. During the administrations of Garfield and Arthur party lines were greatly blurred. The tariff act of 1883 and also the Pendleton Civil Service Bill received support from both sides of the chambers, yet they were in the main regarded as Republican measures. In 1884 the Republican platform was unusually pronounced in its advocacy of a protective tariff and urged international bi-metallism, the regulation of interstate commerce, and the restoration of the navy to its old-time strength and efficiency. The nomination of Blaine proved in many respects to be ill-advised. A large section of the party (see McGWYMP) refused to support him, and gave their votes mainly for Cleveland, who was elected, carrying not only the 'Solid South,' but also New York, Connecticut, New Jersey, and Indiana. During his administration Democrats were in the majority in the House. Substantial gains were made in the reform of the civil service and in the regulation of interstate commerce (Act of 1887), both of which the Republican platform had urged. A protectionist faction in the Democratic Party aided the Republicans in preventing a reduction of import duties. Cleveland's message of December, 1887, made the tariff the dominant issue of the campaign of the following year. The Republican platform declared the party to be "uncompromisingly in favor of the American system of protection;" asserted its opposition to combinations organized "to control arbitrarily the conditions of trade among citizens;" favored the "use of both silver and gold as money," and the building up of a strong navy. The nomination of Harrison,

of Indiana, and Morton, of New York, helped the party to regain those States and win the election. A scanty majority was secured in both branches of Congress. The "Omnibus Bill" for the admission of the Dakotas, Montana, and Washington brought the Republicans some votes, and Speaker Reed's rules put the House under the firm control of the majority, although they aroused not a little opposition. The protectionist McKinley Tariff Bill was passed, with the addition of a reciprocity clause. But in the Congressional elections of 1890 the Republicans were overwhelmingly defeated, and the Democrats carried the Presidential election of 1892 by a large electoral majority. The Republican platform had been very similar to that of 1888, and the nominations had aroused little enthusiasm; a rise in retail prices had followed the going into effect of the McKinley tariff, and had made it unpopular. During the first half of Cleveland's second administration the Republicans were in a decided minority in both Houses. But the reaction due to the disastrous panic of 1893 and dissatisfaction with the long-deferred and inconsistent Wilson-Gorman Tariff Bill presently reversed the situation in Congress, again bringing the Republicans into control. In the campaign of 1896 the currency issue was the all-important one. Twenty-two Republican State conventions pronounced against the free coinage of silver, and the platform of the national convention asserted the party's opposition to free coinage except by international agreement. Upon the adoption of this resolution, thirty-four free-silver delegates withdrew from the convention. The platform further "renewed and emphasized the party's allegiance to the policy of protection," and promised "to all of our products" "the most ample protection;" it favored a protectorate over Hawaii, and insisted that the United States "should actively use its influence and good offices to restore peace and give independence to Cuba." In this campaign the Republicans received aid from the 'Gold Democrats;' even the 'Solid South' was broken. McKinley received a majority over all other candidates of 286,257. The appeal which the Democrats had made to class animosity had reacted in favor of the Republicans, as the party of conservatism. In the following year the Republicans found themselves in control of both branches of Congress, though their majority in the Senate was but narrow. The Dingley Bill was promptly passed, restoring the strongly protective character to the tariff. The war with Spain, in 1898, forced to the front questions of policy which had been quite unforeseen, and on which clean-cut party lines could not be drawn. The annexation of Hawaii had long been a favorite measure with some Republicans, and was effected by Republican votes. In 1899 the Republicans secured a strong majority in the Senate, and forthwith enacted a law making the gold dollar unequivocally the unit of value. Upon questions relating to the government of 'dependencies,' however, there was some crossing of party lines, a few leading Republicans with most of the Democrats taking the ground that the United States could not govern alien peoples without the consent of the governed. In the campaign of 1900 the great issue was that of 'imperialistic expansion.' The Republican platform renewed the pledge of independence to Cuba; and declared it to be "the high duty of the Gov-

ernment" "to put down armed insurrection and to confer the blessings of liberty and civilization upon all rescued peoples," promising them the largest measure of self-government consistent with their welfare and our duties. Again McKinley was the Republican nominee against Bryan, and he increased his vote over that of 1896. Outside of the Southern States the Democrats secured only 13 electoral votes, all from States dominated by the silver interest. In the first Congress of the new century the Republicans increased their strength in both Houses. The pledge of Cuban independence was redeemed, but within the party there arose serious differences as to the policy to be pursued toward the Philippines and also over reciprocity, which had been strongly indorsed in Republican platforms, but to which large financial interests, of great weight in Republican councils, stood inflexibly opposed.

The Republican Party began its career through a fusion of various party elements opposed to the extension of slavery. Its original task was accomplished with the close of the reconstruction period. New tasks have caused a differentiation in the party's personnel and in its centres of influence. In the industrial agitations of the closing years of the nineteenth century it found itself forced to stand upon the defensive as the party of conservatism. It has ever represented strong nationalizing forces at home, and a vigorous foreign policy, and its principles of broad interpretation of the Constitution have led it to enter with confidence upon the solution of problems imposed upon the United States by the expansion which followed the war with Spain.

REPUBLICAN RIVER. One of the head-streams of the Kansas River. It is formed by two forks in east central Colorado, and flows north-east into Nebraska, then east, and finally south-east into Kansas, where it joins the Smoky Hill River at Junction City to form the Kansas River (Map: Nebraska, F 3). It is about 500 miles long.

REPUDIATION (Lat. *repudiatio*, from *repudiare*, to repudiate, from *repudium*, repudiation, rejection of what one is ashamed of, from *re-*, back again, anew + *pudere*, to be ashamed). The refusal of a State or government to pay its debt. It grows out of the practical bankruptcy of the State, though it often seeks justification

in the plea that the obligations previously admitted were illegal and therefore invalid. Debt-sealing by refunding operations frequently approaches repudiation in its practical effects, though it generally escapes the reproach of the name unless there are obligations or classes of obligations which are wholly ignored in the process. Among nations and States of weak public credit the practices mentioned are only too familiar, but the odium of the name attaches particularly to the history of the financing of the American commonwealths. In 1790 all existing State debts had been assumed by the general Government, partly on the ground of justice, because they had been contracted in the prosecution of the Revolutionary War, partly on that of expediency, as a means of strengthening the public credit. For a period of 40 years thereafter the State governments remained almost free from liabilities, notwithstanding the fact that the War of 1812 had called for extraordinary expenditures, and in 1830 the aggregate debt of all the States was only \$13,000,000. Then began an era of extravagant speculation and reckless enterprise. Population was increasing, and production was increasing even faster than population. The resources of the soil were more than equal to any demands that could be made upon them. But as yet no adequate means of communication between producer and consumer had been established, and a universal need was felt for such facilities of transportation as would insure quick delivery at moderate rates. To the sanguine colonist it seemed that the construction of railroads and canals was a work of public importance which would justify almost any financial assistance on the part of the State, and would return the investment a hundredfold.

States issued bonds in aid of the construction of railroads and canals, and in the South especially subscribed to bank stock, for the purchase of which they issued bonds. In other cases they simply indorsed the bonds of railroads and banks. Nor was it difficult for the States to secure loans. The United States national credit stood high abroad. Not only had the interest been promptly paid upon the national debt, but the United States offered the extraordinary spectacle of a nation which had actually paid the principal. European money-lenders, who had not yet learned to discriminate between national and State securities, felt confidence both in the honor and in the resources of the country. The bonds of the several States were therefore easily disposed of in foreign markets, until in 1842 their aggregate debt had swollen to the enormous total of \$213,000,000, an increase of more than 1500 per cent. since 1830. The panic of 1837 and the subsequent tightening of the money market precipitated the inevitable crash. First, Indiana found it impossible to meet the interest of her debts in 1840; Ohio was saved from following her example only by extraordinary efforts. Two years later the Bank of Pennsylvania failed, and every bank south of Philadelphia suspended payment. In the panic that ensued, Pennsylvania, Maryland, Mississippi, Michigan, Florida, Indiana, and Illinois found themselves in a condition approaching bankruptcy. But though all these States suspended payment of accruing interest, all of them, except Mississippi, Michigan, and Florida, finally

weathered the storm without resorting to the repudiation of any part of the capital debt.

It was in Mississippi that the word repudiation originated, in a message by Governor McNut of that State suggesting the plan of "repudiating the sale of certain of the State bonds on account of fraud and illegality." The bonds, to the amount of \$5,000,000, had been issued in 1838 as a subscription to stock of the Union Bank of Mississippi. As the bank succumbed early to reckless management and the security of the State became worthless, the State found itself saddled with a debt from whose expenditure it had had no benefit. It is not surprising that certain apparent irregularities in the issue of the bonds should be seized upon as a pretext for denying the debt, though the courts of the State later decided that these irregularities were not so material as to invalidate the bonds. The Legislature of Mississippi promptly branded this suggestion of repudiation as "a calumny upon the justice, honor, and dignity of the State." But though for the time being the bonds were thus saved from being formally repudiated, they fell into default. Successive Governors, indeed, urged their payment, but no provision was made for the purpose until 1852, when a proposition to levy a tax to pay the bonds and interest was submitted to the people and defeated at the polls by an overwhelming majority. Florida, which in the thirties had borrowed about \$3,900,000 for the support of banks, was caught in the bank failures and refused to pay her debts. In the meanwhile Michigan had repudiated a portion of its liabilities under the following circumstances: Certain bonds had been disposed of to the Morris Canal and Banking Company, to be paid for in installments. The Bank of Pennsylvania had become surety for the payment of these installments as they fell due. But canal company and bank both failed. It was ascertained that a large amount of the bonds, for which only partial payment had been made, had been transferred from the canal company to the bank, the latter having full knowledge, of course, of all the facts. It is true that the bonds had been hypothecated in foreign markets, and were now in the possession of innocent holders. Nevertheless, the State claimed that it was bound to repay only the money it had actually received, called for the surrender of the 'part paid' bonds, and issued new certificates for the amount it had actually received, with interest thereon.

The course pursued by Louisiana was equally open to criticism. The State had raised capital for internal improvements by loaning her credit to banks whose stock was secured by mortgages on real estate. During the era of prosperity these banks discounted a great deal of business paper which turned out to be bad when the day of trial came. In 1843 the Legislature enacted that all debts due to the bank should be payable in the depreciated State bonds issued by the banks, at their par value. In ante bellum times, however, repudiation was in its infancy. After the war it sprang to great proportions, as the Southern States generally repudiated their debts. The burden of debts had greatly increased from 1860 to 1870, while the resources of the country had been wasted by the war. Practically no interest had been paid upon the debt contracted before the war. The so-called period of reconstruction was, moreover, riotous in its expendi-

ture of public moneys and brought about a large increase of the debt. With the revival of old conditions and the return to power of the classes which nominally ruled the States, the inability to pay resulting from the impoverished condition of the country was combined with a reluctance to pay debts which in their opinion had been forced upon the States by outsiders. In this category they placed the accrued interest upon anti-bellum debts as well as much of the debt which had its birth in the so-called reconstruction era. It is impossible to follow the history in all its details. With pretenses of fraud, jobbing, and corruption in the issue of bonds, or on the simple plea of poverty, one Southern State after another annulled its obligations outright or so scaled them in retmuding operations as to destroy a large part of their face value. The aggregate debts of the States along the coast from Virginia to Louisiana, with Arkansas and Tennessee, are computed to have reached, each State taken at its highest point, \$236,000,000, while in 1880, after the policy of repudiation had been adopted, they amounted to \$108,000,000. The Southern States were joined by one Northern State, Minnesota, which in 1880, after 22 years of agitation, denunciation, and negotiation, finally agreed to compromise the payment of certain railroad bonds (guaranteed by her as far back as 1858) at 50 cents on the dollar, and accrued interest, the plea being that the railroads had failed to comply with the conditions of the issue. The inevitable result of repudiation has been that foreign capitalists have learned to discriminate between the values of different State securities; and while the bonds of the non-repudiating States, including those Southern States which have not followed the example of their neighbors, command a premium, the bonds of the various repudiating States fluctuate at from 10 to 50 per cent. of their face value.

Repudiation has not been confined to States. During the five years immediately following the panic of 1873, numerous cities, towns, and counties, even within those States whose corporate credit remained unimpaired, finding it impossible to meet their obligations, sought to evade them by repudiation. By appeal to the United States courts, however, their creditors could command an impartial judicial determination of the question. This is impossible in the case of States, as the 11th amendment of the Constitution, adopted in 1794, expressly provides that though individuals may be sued by States, States cannot be sued by individuals. Under this amendment, and the decisions which have grown out of it, no power can legally coerce a State to keep its pledges. There is therefore no power in the United States Government to prevent a recurrence of the humiliating spectacle of repudiation. The States only can provide remedies for it. The substantial increase of wealth in all sections of the country affords a guarantee for the future. Another and perhaps more efficient safeguard against its recurrence is to be found in the innumerable restrictions upon the debt-making power of the States which have found their way into recent State Constitutions.

Consult Scott, *The Repudiation of State Debts* (New York, 1893).

REQUESTS, COURT OF. An ancient English court having minor chancery jurisdiction, and

presided over by the Lord Priuy Seal. It was intened to the Court of Chancery. It was abolished by Stat. 16 and 17 Car. I., c. 10. Certain inferior courts for the collection of small claims were formerly called courts of requests, or courts of conscience. They have all been abolished by statute, or have become obsolete. See Courts.

REQUIEM. *Requiem* (Lat., rest). In the Roman Catholic Church, the mass for the dead; so called from the first word of the introat. Requiem masses were composed by many of the older masters, such as Palestrina, Vittoria, Anerio, Colonna. The most famous works of this kind in modern times are those of Mozart (1791), two of Cherubini, *Minor* (1793), *Major* (1836); Berlioz (1837); Verdi (1873). One of the greatest choral works ever written bears also the title *requiem*, although it is written to German words selected from the Bible. This is the great *Ein deutsches Requiem* by Brahms, written on the death of his mother (1868).

REQUISITIONS (Lat. *requisitio*, from *requirere*, to search for, require, from *re*, back again, anew + *quere*, to seek). Articles of daily consumption and use levied by an invading army from the inhabitants of occupied territory. They must be distinguished from *contributions*, with which the term is often confused, the latter being properly confined to money impositions above the ordinary revenue which legitimately belongs to the invader; and from *fiacs*, which are payment exacted from a district by way of punishment for some offense committed against the enemy outside the regular military operations.

The adoption by civilized nations of modern rules of warfare prohibiting pillage does not guarantee security of property to an invaded district. The experiences of the past century have authorized three methods of obtaining support for an invading army from an occupied district. (1) It may purchase provisions and like articles required for consumption; (2) it may levy them at prices fixed by the commander; (3) it may force the inhabitants to furnish them without payment and on refusal send out detachments to collect them. Thus the produce of the farmer, the goods of the merchant, and the stock of the trader may be confiscated. By the Brussels Military Code (1874), Arts. 10, 12, rules are laid down governing the making of requisitions. It is customary for the modern army to have a vast commissary train, and requisitions are relied upon only to supplement this supply. The commander of the army may levy such articles as clothing and boots, to prepare which time is required, while corps commanders may requisition food and fodder for immediate use. The collections should be made through the local authorities, if these continue, by demand in writing, and receipt should be given as evidence of the compliance and as a voucher in case the Government should subsequently recoup the inhabitants. The discretion of the invader must be employed to apportion these demands to the resources of the district. *Contributions*, on the other hand, should be imposed only "on the order and responsibility of the general-in-chief, or of the supreme civil authority, established by the enemy in the occupied territory" (Brussels Code, S. 11). In levying contributions a assessment should be made on the lines of civil taxation.

Louis may be levied by the invading commander to secure the safety of his communications and his troops. Consult: "Instructions for the Government of the Armies of the United States in the Field," *General Order No. 100, Adjutant General's Office* (War Department, Washington, 1863); also "Brussels Military Code," in *Proceedings of Brussels Conference* (Brussels, 1874); and "Hague Military Code," in *Proceedings of the Hague Conference* (The Hague, 1898).

REREDOS (OF., behind the back). The wall at the back of an altar, seat, or large fireplace. In churches the reredos is usually in the form of a screen detached from the choir. It is of two forms: a slight movable screen, and a permanent heavier structure. The custom did not become common until the position of the priest at the altar changed, toward the twelfth century, so that his back was turned to the congregation. Early ones were often merely hanging tapestries on rods; some were screens of gold and silver reliefs rising at the back of the altar, like the Pala d'Oro at San Marco, Venice, and that at San Jacopo, Pistoia, while others were of carved ivory, like one in the Cluny Museum (Paris). The architectural screens, with niches, statues, marble reliefs, and paintings, are especially fine in English and Spanish churches. The reredos corresponds somewhat to the choir-screen previously used in the West and still used in the Greek and Russian churches between the altar and the congregation.

REESBY, рѣзѣль, Sir JOHN (1634-89). An English historian, born in Thirbergh, Yorkshire. He entered Trinity, Cambridge, but left almost immediately for Gray's Inn; traveled on the Continent for several years, and after the Restoration served as high sheriff of Yorkshire, then for several years in the House of Commons, and (1682 sqq.) as governor of York. He was an able politician and foresaw James's fall in time to save himself and make favor with William of Orange. His *Memoirs* (1734) and *Travels* printed with the *Memoirs* (1813, 1821, 1831) are very valuable documents for the history of the time.

RESACA DE LA PALMA, рѣсѣка дѣ ла пѣльма, BATTLE OF. A short but hotly contested engagement, fought on May 9, 1846, during the Mexican War, between about 5000 Mexicans under General Arista and about 2300 Americans under General Taylor, which ended in the defeat of the Mexicans. The ravine in which it occurred, covered by a thick growth of palm trees, is in Cameron County, Texas, 4 miles north of Brownsville, on the Point Isabel road. The Americans lost 39 killed and 83 wounded, the Mexicans about 160 killed, 228 wounded, and 100 missing, though by some writers the total number of killed, wounded, and missing has been given as 1000. Consult: Bancroft, *History of Mexico*, vol. v. (San Francisco, 1885); and Howard, *Life of General Taylor* (New York, 1892), in the "Great Commanders Series." See MEXICAN WAR.

RÉSAL, рѣзал', HENRY AMÉ (1828-96). A French mathematician and engineer, born in Plombières (Vosges), and educated at the Ecole Polytechnique and at the School of Mines. He served for fifteen years as departmental engineer of Doubs, gaining some repute there for his work on the mathematics of geology; became

professor of mechanics in the Polytechnique in 1870; was elected to the Academy of Sciences in 1873; and in 1888 was appointed inspector general of mines. Résal wrote many valuable memoirs on mechanics and physics. His published work includes: *Traité de cinématique pure* (1862); *Traité de mécanique céleste* (1865; 2d ed. 1884); *Traité de mécanique générale* (1873-89); *Traité des surfaces* (1891); and a French version of Salmon's *Analytical Geometry* (1870).

RESCISSION (Lat. *rescissio*, a cutting off, retrenchment, from *rescindere*, to cut off, from *re*, back again, anew + *scindere*, to cut). In law, the rescinding or setting aside of a contract, either by mutual agreement of the parties to it, or by direction of a court of equity because of some legal defect in the contract. See CONTRACT.

In the case of rescission not depending on mutual agreement, the right to rescind may be based either upon fraud or mistake in the inception of the contract. The right of rescission on ground of fraud arises as soon as the party who is entitled to rescind has notice of the fraud. If, with full knowledge of the fraud, he continues to act under the contract or pursuant to its terms, he will be deemed to have approved the contract and to have waived his right of rescission. Upon rescission of the contract he is entitled to compel a restoration of property which he has given as performance of the contract on his part or to recover its money value in a quasi-contract action. He cannot, however, recover the property so given from third parties who are purchasers for value without notice. See FRAUD; EQUITY.

A court of equity, however, will disregard the parol-evidence rule as to written contracts (see EVIDENCE) if it finds that there was actually no agreement or meeting of the minds of the parties as to the term of the contract, and it will compel a surrender and cancellation of the written contract and a restoration of the parties to the contract to their original positions. This form of relief is technically known as rescission, although its real purpose is to render non-effective written evidence which has been improperly obtained or given. In case of all verbal contracts one entitled to rescind may do so without the aid of a legal proceeding by merely giving notice. This right, although equitable in character, is recognized and enforced at law. Upon giving such notice to the other party to the contract it is thereupon deemed to be at an end; and the party rescinding the contract is entitled to receive back the money or property which he has given under the contract, the title to the money or property being re-vested in him by operation of law as consequence of the rescission. He may not lawfully take the property forcibly, however (see REMEDY), but may at his election bring an action in quasi contract for the value of his performance under the contract, or trover for damages for refusal to return property, or replevin to recover the property itself. As a condition precedent to rescission he should also return any money or property which he has received under the contract.

In case of all contracts, whether written or verbal, if one entitled to rescind the contract on ground of fraud is sued upon the contract, he may set up the fraud as a defense. Fraud is strictly an equitable defense, but it has been

completely adopted by the law. It does not conflict with the parol-evidence rule, as the effect of proof of fraud is not to vary the terms of the contract, but to show that on equitable grounds the contract actually entered into should not be permitted to remain operative. If, however, one who has entered into a written contract wishes to be released from its obligations at any time on ground of mistake, or if he wishes to be released from the contract at any time before he is actually sued upon it on the ground that the contract was induced by fraud, his only relief is in equity, since the primary relief which he seeks is the cancellation and surrender of the contract. See CHANCERY; EQUITY. See also REFORMATION.

RESCRIPTS (Lat. *rescriptum*, answer, from *rescribere*, to write back, from *re-*, back again, anew + *scribere*, to write). Answers of the emperors and popes to questions in jurisprudence officially propounded to them. In the Roman Empire the *rescripta principis* were one of the authoritative sources of the civil law. After the third century they increased in number rapidly and superseded the responses of the jurists as one of the most important sources of Roman law. The privilege of giving responses no longer being conferred upon the jurists. The rescripts directed to corporate and municipal bodies were known as *pragmatica sanctiones*, a name which has found its way into the public law of Europe. See PRAGMATIC SANCTION.

RESCUE. In criminal law, procuring or aiding in the forcible deliverance of a prisoner from lawful imprisonment, by a third person. By the common law, a rescuer was held guilty of the same degree of crime as the prisoner, if he knew that the latter was lawfully detained when he rescued him. This knowledge was presumed if the culprit was in prison, or in the custody of an officer of the law, at the time. To-day, the offence is punishable in most jurisdictions, but not with the same severity as at common law.

In maritime law a rescue is the retaking of a captured prize from the enemy by prisoners of war. The latter do not acquire any rights in the recaptured property, but must return it to the lawful owners.

RESCUE GRASS, SCHRADER'S BROME GRASS (*Bromus unioloides*). A strong-growing South American grass introduced into many parts of the world; in the United States under the name of Australian oat. Its leaves are flat, linear, slightly roughened; its panicles spreading with numerous rather large flattened spikelets resembling the well-known 'chess' or 'cheat,' to which it is closely related. It grows rapidly to a height of 1 to 3 feet, seeds freely, and dies after seedling. In the Southern States it is regarded as one of the best winter grasses, as it makes its principal growth during cool weather. It is usually cut several times during the season and if prevented from seeding continues for 2 or 3 years. If properly treated it is a valuable brome grass (q.v.), excelling rye or oats as a winter grass and in the large amount of nutritious hay it yields. It withstands drought well and will grow on almost any soil; its best growth, however, is on rich moist soil.

RESECTION (Lat. *resectio*, from *resecare*, to cut off, from *re-*, back again, anew + *secare*, to cut; connected with OILG. *segu*, Ger. *Sägen*, AS.

sega, *sega*, Eng. *saw*), or EXCISION OF JOINTS. An operation in which the diseased bone of a joint is cut out, in place of cutting off the entire limb. This operation is safer in properly selected cases than is amputation, since there is diminished shock, from the absence of severance of large nerve trunks, arteries, and veins. Besides this advantage there is left to the patient a fairly useful limb, though there is, of course, more or less debility and the motility of the joint is lost. The extent of the disease process present and the possibility of extension of the disease above the joint after operation, as occurs in malignant disease (see TUMOR), are the factors that determine the surgeon in a choice between resection and amputation. In young patients, where excision of a joint often includes the epiphyses of the growing bones and interferes materially with the future growth and development of the limb, the scope of the operation is much restricted. Owing to the development of more conservative measures in dealing with diseases of the joints, formal or complete excisions are not now practiced as much as they were by surgeons of a decade ago. For a description of the operation of excision as applied to the different bones and joints, consult STIMSON, *Operative Surgery* (Philadelphia, 1893).

RESERVATION (ML. *reservatio*, from Lat. *reservare*, to keep back, from *re-*, back again, anew + *servare*, to keep). In English law a term applied to a clause in a deed, lease, or grant of land, which reserves out of the estate conveyed a right or interest in a portion of it. An estate in a stranger, or person not a party to the conveyance, cannot be created by reservation, which can only operate in favor of the grantor himself. In the United States the word is frequently used as synonymous with exception. (See CONVEYANCE; DEED; MORTGAGE; LEASE.) The term is also employed to describe a method of obtaining the opinion of a full bench of a court or an appellate court upon a point of law as to which the trial judge is doubtful. This often saves the necessity of making a ruling compelling the parties to appeal afterwards. The jury is usually allowed to find the facts, and the verdict or judgment is not entered until the reserved point is decided. In many code States this is accomplished by taking a verdict subject to the opinion of the court.

RESERVATIONS, INDIAN. See INDIAN AFFAIRS; TREATIES, INDIAN.

RESERVE (OF. *reserre*, Fr. *réserve*, from OF. *reserver*, Fr. *réservé*, to reserve, from Lat. *reservare*, to keep back). A term common in military affairs both as regards the material and the personnel of an army. For *reserre* in European armies, see ARMIES; LANDWEHR; MILITIA; VOLUNTEER MILITARY.

RESERVE, NAVAL. See NAVAL RESERVE.

RESERVED CASES. A term applied in the Roman Catholic Church to sins of a heinous character, such as heresy, simony, and sacrilege, that for their adequate treatment require the attention of an ecclesiastic superior to the parish priest, either the Pope, the bishop, or the head of an Order. The object of transferring the right to absolve such sins to the higher ecclesiastic is partly to impress upon the offender the true turpitude of his offense. Consult Hausmann,

Geschichte der papstlichen Reservatfälle (Regensburg, 1808).

RESERVOIR. See DAMS AND RESERVOIRS; WATER WORKS.

RESHID PASHA, re-shād' pā-shā'. MUSTAPHA MIHMEF (1802-58). A Turkish statesman, and long the chief of the Party of Progress in Turkey. He was born at Constantinople. In 1833 he negotiated the Treaty of Kutaiia with Mehemet Ali (q.v.), the rebellious Viceroy of Egypt. He subsequently represented Turkey at the courts of Great Britain and France, but was recalled in 1837, and made Foreign Minister. In this office he aided the Sultan Mahmud II. in carrying out his plans for the reform of the administration; but the Old Turkish Party forced him out of his office before the close of 1838. After this he was sent as envoy to London, Berlin, and Paris. On the death of Mahmud II., in 1839, when the Ottoman throne was tottering under a fresh onslaught by Mehemet Ali, Reshid Pasha was again called to take charge of the Foreign Office by the mother of the young Sultan, Abdul Medjid. He succeeded, after a debate in council of three days' duration, in obtaining the *hatti sharif* (q.v.) of Gulhane (November 3, 1839), a constitutional charter which, however, soon became a dead letter. His foreign diplomacy checked Mehemet Ali in Syria through the intervention of the Quadruple Alliance (Great Britain, Austria, Prussia, and Russia), but a seraglio intrigue led to his dismissal. From 1841 to 1845 he was the Turkish representative at the French Court. In 1845 he was once more made Foreign Minister, and in 1846 he was appointed Grand Vizier. He was repeatedly deposed, and almost immediately recalled, according as the anti-reform party gained or lost the favor of the Sultan; but the complications with Russia which arose in 1853 threw the anti-reformers into discredit, and Reshid Pasha, more powerful than ever, was again recalled to the direction of foreign affairs. In 1855 he again retired from office, which he did not resume till after the Peace of Paris.

RESHT, rēsh't. The capital of the Province of Ghilan, Persia, situated near the southwest shore of the Caspian Sea, 150 miles northwest of Teheran (Map; Persia, C. 3). The houses are tiled and neatly built, and the streets are paved. Water is supplied by an aqueduct. There are a vast ruined palace, numerous caravansaries, large bazaars, and about 1200 shops and warehouses. Indian wares are imported from Balfrush in Mazanderan, and European manufactures from Russian Armenia. Resht is the chief entrepôt for the Persian silk trade. Extensive manufactures of shawls and carpets are carried on. Population, about 40,000. Enzeli, the port of Resht, on the Caspian Sea, about 18 miles distant, has 1500 inhabitants.

RESICZABÁNYA, ré'shíts-á-bán'yó. A mining town in the County of Krassó-Szörény, Hungary, about 50 miles southeast of Temesvár. There are extensive iron and coal mines and iron works in the vicinity. Population, in 1900, 11,770.

RESIDENCE (ML. *residentia*, from Lat. *residere*, to reside, remain, from *re-*, back + *sedere*, to sit; connected with Gk. ἔσθαι, *hesthai*, Očlurch Slav. *sěsti*, Skt. *sad*, Goth. *sitan*, OHG. *sitzen*, Ger. *sitzen*, AS. *sittan*, Eng. *sit*). The

obligation to perform in person the duties of a benefice whose revenue was enjoyed. It was early a complaint that this obligation was violated. The Council of Sardica (347) in its twelfth canon enjoined upon bishops and in the sixteenth upon presbyters the duty of continuous service in their proper residence. The evil continued through the centuries. In Reformation times it was a reproach that non-resident holders of benefices were so common, owing to the custom of pluralities. The Council of Trent endeavored to remedy the evil by providing in its 23d and 24th sessions, that no prelate should absent himself from his diocese more than three months, except for urgent cause. In present practice in the Roman Catholic Church parish priests cannot be absent longer than one week from their cure, except with the permission of the bishop.

RESIDUAL ROCKS (from Lat. *residuum*, remainder, from *residere*, to reside, remain). Rocks which have been produced through the decomposition and disintegration of rocks belonging to any of the larger divisions; viz. sedimentary, igneous, and metamorphic rocks. The agents which bring about these changes are in part chemical and in part physical. The active agents of chemical change at the surface of the earth are oxygen, water, and carbonic acid, all of which exist in the atmosphere and in the waters which percolate within and near the earth's surface, and the changes which they bring about are chiefly oxidation, hydration, and carbonization. The new minerals which are developed by these processes may be said to be in general lighter in weight (more bulky) and more soluble than the minerals out of which they have been formed. They are also as a class softer, and possess for the most part a fibrous or scaly texture. Particularly due to the change in volume which this recrystallization involves, a physical force is brought into play which opens fractures in the rock and permits of its solution and disintegration. The more soluble constituents of the rock are taken in solution and removed, while the less soluble materials remain as a more or less incoherent mass constituting the residual rock type. The residue from rocks of igneous and generally granitic types has been given various names such as 'waste,' 'geest,' 'Gruss,' etc. In unglaciated regions residual rocks of this type occasionally possess their original textures, lacking only the compactness characteristic of those types. Where situated on steep slopes the upper portions of the deposit of waste will by the force of gravitation slide down toward the valley, a process which is described as 'creep.' In glaciated regions, on the contrary, the surface layers of waste have been carried away by the ice mantle and the hard underlying rock has usually also been planed down. The comparative recency of the glacial epochs in a geological sense thus furnishes a certain measure of the time necessary to decompose and disintegrate compact rock masses. The final product of decomposition and disintegration of granitic rocks is a fine clay or kaolin, and this has been the source of the great deposits of porcelain clay throughout the world. Before this final stage of the alteration has been reached the residual rock has usually the structural peculiarities of a coarser or finer sand, and thus we have the residual sand of granite, etc. Calca-

reous rocks, such as limestone or dolomite, furnish in the initial stages of their solution and disintegration a granular calcareous sand. Joints and other fissure planes in massive rocks greatly facilitate the processes of decomposition and disintegration. The solutions which are active in these processes find their way along the joint planes as trunk lines, and by their more ready access to the edges and corners of included blocks of rock soon produce a spheroidal and often concentric structure. This is brought about by spheroidal blocks of the igneous rock type, the centres of which are usually little changed, but the peripheral zones of which represent altered phases of the rock, the outermost being the most nearly disintegrated. This process goes on quite rapidly, as is shown by the fact that monuments and fence posts of basic igneous rocks have within the course of a century so far disintegrated as to be almost useless for the purposes to which they were applied.

Plant life by sending its roots into the soil protects from disintegration the underlying rocks. In arid regions, however, where little if any plant life can exist, winds are effective in removing the superficial layers of waste and continually exposing the underlying rock. The material removed by the winds on being deposited produces aeolian rocks. See **EOLIAN ACCUMULATIONS**.

RESIDUARY LEGACY. A legacy of all that remains of an estate after the debts and specific legacies have been paid. Where a testator desires to give the bulk of his estate to one person, as his wife, and at the same time to make other smaller bequests, it is customary to make the latter by means of express or specific legacies, naming the amount or specific property, and then to devise and bequeath all the 'rest, residue, and remainder' of his estate to the favored person by a residuary clause. It sometimes happens, however, after the debts and minor specific legacies are paid, that the estate is exhausted, and the one whom the testator most intended to favor gets nothing. The best method of guarding against this contingency is to put a condition in each of the specific legacies to the effect that it shall be null and void if the appraised value of the estate is not in excess of a certain sum, or to make an express or specific bequest to the person who is to take precedence over the others, then make the other minor bequests, and conclude by making the first person the residuary legatee of the rest of the estate. See **LEGACY**; **WILL**.

RESINA, râ-sé-nâ. A town in the Province of Naples, Italy, situated on the Gulf of Naples, at the foot of Vesuvius, 5 miles by rail southeast of Naples (Map: Italy, E 11). It is built on the site of ancient Herculaneum. Exquisite fruits are grown, and the famous *Lucina Christi* wine is made in the vicinity. There are manufactures of silk, glass, and leather. The town is surrounded by country houses, and is a place of recreation for the Neapolitans. The ascent of Mount Vesuvius is begun at Resina. Population (commune), in 1901, 19,766.

RESINS (OF. *resine*, Fr. *résine*, from Lat. *resina*, *resine*, from Gk. *ῥητίνη*, *rhētínē*, pine-resin). A class of solid or semi-solid organic substances mostly of vegetable origin. The class

include many minerals which are assumed to be the product of extinct vegetation. The resins are allied to the volatile oils, in which they are found dissolved when directly obtained from plants. The various resins, all composed of carbon, hydrogen, and oxygen, differ widely in their chemical behavior.

The following are the general characters of this class of compounds: At ordinary temperatures they are solid, translucent, and for the most part colored, although some are colorless and transparent. Some are devoid of odor, while others give off an aromatic fragrance from the admixture of volatile oil. In their crude state they never crystallize, but are amorphous and brittle, breaking with a conchoidal fracture; when pure several of them may, however, be obtained in the crystalline form. They are readily melted by the action of heat, and are inflammable, burning with a white smoky flame. They are insoluble in water, but dissolve in alcohol, ether, and various oils. They are insulators or non-conductors of electricity, and become negatively electric by friction. Many of them possess acid properties, in which case their alcoholic solutions redden litmus. These resins combine with the alkalies, and form frothy soap-like solutions in alkaline lyes. The resinous soaps thus formed differ from ordinary soap in not being precipitated by chloride of sodium.

The resins are generally obtained by making incisions into the wood of trees which produce them; sometimes, however, they exude spontaneously, and in other cases require to be extracted from the wood with hot alcohol or other solvents. The crude resins are separated from the volatile oils, with which they form the so-called *oleo-resins*, by distillation; and from the gummy and mucilaginous matters with the aid of alcohol, which dissolves out the pure resins.

The resins are extensively used in making lac and varnishes. Colophony, copaiba, jalap, podophyllum, and the resin of scammony are used medicinally. Colophony, or rosin, is an antiseptic and forms an excellent application for wounds and ulcers. Copaiba acts as a stimulant and disinfectant, and is often prescribed in gonorrhoea. Podophyllum, jalap, and the resin of scammony are purgatives, the latter causing profuse watery evacuation of the bowels.

Various *fossil resins* are known, of which the most important is amber. Some chemists place asphalt among this class; and among the fossil resins described by mineralogists may be mentioned copalin, hartite, xylorin, etc.

Resins also form important constituents of the substances known as *gum resins* (see **GRAMS**) and are contained in the so-called *balzams*, a class of liquid or semi-solid products including benzoin, styrax, and the balsams of Peru and Tolu. Resins containing benzoic or cinnamic acid are sometimes spoken of as 'solid balsams.' The common resin or resin of commerce exudes in a semi-fluid state from several species of pine, being derived chiefly from the *Pinus australis* and the *Pinus pinaster*. The crude turpentine (an oleo-resin) obtained from these trees is distilled, leaving behind the resin, a brittle solid somewhat heavier than water. The resin soap used in the manufacture of common qualities of soap is obtained by boiling resin for some time with caustic soda and water. Other resins most commonly known and used include copal, dam-

mar, dragon's blood, frankincense, lac, mastic, and sandarac.

Consult: Wiesner, *Die technisch verwandten Gummierharze und Balsame* (Erlangen 1866); Thomis, *Die Harze und ihre Producte* (Vienna, 1879); Cameron, *Oils, Resins, and Varnishes* (London, 1886).

RESIN WEED. See COMPASS PLANT.

RESISTANCE, ELECTRICAL. That property of a conductor which determines the intensity of an electric current flowing through it for a given difference of potential at its terminals. The resistance of a conductor varies with its temperature, but is the same for all currents. The unit of resistance, the ohm (q.v.) is such a resistance as will cause a current of one ampere to flow over a conductor when there is difference of potential of one volt between its terminals. This relation is given by Ohm's law that $C = \frac{E}{R}$ where C stands for the current, E for the electromotive force, and R for the resistance. The resistance of a homogeneous conductor will vary directly as its length and inversely as the area of its cross-section, or in the case of a round wire inversely as the square of the diameter. Specific resistance is the resistance of a centimeter cube of a substance in microhms, while the relative conductivity of a conductor is its relative resistance to some standard substance, generally annealed copper. Resistance may be measured by means of the Wheatstone bridge (q.v.) or by substituting known resistances for unknown, so as to produce an equivalent current, which is indicated by the deflection of the galvanometer (q.v.). Another method is to use the differential galvanometer and so arrange the known resistances that the same current flows through each set of coils, while there are also methods where use is made of the condenser and ballistic galvanometer. See ELECTRICITY; CONDUCTOR; OHM; ELECTRICAL UNITS.

RES JUDICATA (Lat., thing adjudged). In law, a matter of controversy which has been finally decided and determined on its merits by a court of competent jurisdiction. This implies that there has been no fraud or collusion by which the court has been misled. The importance of this doctrine lies in the fact that if a matter is once judicially determined it cannot again be litigated. To make the entire subject-matter of an action *res judicata* all the parties interested must be made parties thereto, either as plaintiffs or defendants. Only the points actually decided come within this rule. See JEOPARDY; JUDGMENT.

RESOLUTION. In law, an act or official expression of the will of a legislative body, corporation, or organized assembly. The term is sometimes used as being synonymous with *ordinance*, when applied to an act of a municipal council or a board of aldermen. However, resolutions are usually adopted to authorize ministerial acts, or to express the sentiment or regard of a body, whereas ordinances are passed to prescribe permanent rules of conduct or law. For example: If a common council desires to regulate the speed of vehicles, it would be done by an ordinance; whereas, if the freedom of the city were to be extended to a distinguished guest, it would be done by a resolution.

In the civil law the discharge of a valid contract by consent of the parties or by decree of a court is said to be a *resolution* of the contract. This is distinguished from a rescission, which implies that the contract was void *ab initio*.

RESONANCE (OF. *resonnance*, Fr. *résonance*, from Lat. *resonantia*, echo, from *resonare*, to sound back, from *re-*, back again, anew + *sonare*, to sound, from *sonus*, sound; connected with Skt. *svan*, to sound). A general mechanical property which has many illustrations in nature. If a large bell is to be set in motion, it is only necessary to apply a series of impulses regularly timed at intervals to correspond with the natural period of the body. The column of air in a bottle or tube may be set in vibration by waves whose period is the same as that of the column of air. (This is illustrated by the strengthening of certain sounds heard when a bottle or a large sea-shell is put near the ear, for in any room there are present waves of all periods.) If a train of ether-waves passes through some material medium the minute portions of which have a frequency the same as that of the waves, it will set these portions of matter vibrating. The waves thus lose energy, which is gained by the matter. See RADIATION; ABSORPTION OF WAVES.

RESONATOR. A device used in acoustics (q.v.) to reinforce or strengthen a given tone. Resonators, which are used largely in the analysis of sound, consist of hollow vessels usually bulb-shaped or cylindrical. The air of such a vessel has a natural period of vibration, and when the resonator is brought near a sounding body which is emitting waves of the same frequency the former will take up the vibration and will emit the sound. In analyzing sound which is made up of numerous harmonics or overtones the resonator will select a particular sound, which it will reinforce, and if a diaphragm is placed so that it will vibrate under the action of the air in the resonator, the motion can be communicated to a small gas flame, as in Koenig's manometric capsule. Resonators in the form of wooden boxes are frequently used to mount tuning forks on and are constructed of such dimensions that the contained air will vibrate in unison with the fork and so strengthen the sound.

RESORCIN, or RESORCINOL (from *res-in* + *orcina*), $C_6H_4(OH)_2$. A diatomic phenol first obtained by Hlasiwetz and Barth in 1864, by fusing resins with potassium hydroxide. It has since been obtained by various other reactions. On an industrial scale it is made by fusing the sodium salt of meta-benzene-disulphonic acid with caustic soda, resorein being thus produced according to the following chemical equation:

The mixture is acidified with hydrochloric acid, and the resorein is separated by means of ether or some other liquid in which it is soluble. The crude resorein thus obtained is purified by distillation. It may be added that the meta-benzene-disulphonic acid used in making resorein is obtained by heating benzene with fuming sulphuric acid. Pure resorein is a colorless crystalline substance melting at 119° C. (246.2° F.) and boiling at 276.5° C. (529.7° F.). It has a faint odor and a sweetish taste, but leaves a dis-

agreeable pungent after-taste. It is freely soluble in water, alcohol, ether, benzene, amyl alcohol, glycerin, and other organic liquids. Resorcin is largely used in the arts for the preparation of phthalic dyes, such as fluorescein, eosin, etc.; it is also employed in the manufacture of azo-colors. It is often used in medicine. When applied externally it has the effect of removing scales in chronic skin diseases; it is an excellent remedy for dandruff, a mixture of resorcin and glycerin being best employed for this purpose. Administered internally, in dilute form, it is very valuable in fermentative dyspepsia.

RESPIRATION (Lat. *respiratio*, from *respirare*, to breathe), ORGANS AND PROCESS OF. The two great objects of respiration are: (1) To supply that amount of oxygen to the body which is essential to its economy, and (2) to remove the carbon dioxide which has been produced as a waste product. We may consider the anatomical details of the respiratory process in man and mammals under three different heads. First, there must be a special respiratory organ—the lungs—affording by its internal arrangement an immense extent of internal surface, covered by vascular network, through which the blood flows in innumerable minute streamlets, only separated by an extremely thin membrane from the atmospheric air that has been inhaled; secondly, there must be such an arrangement of the circulating system that fresh blood may be continually driven through the lungs, and then onward to the general system; and thirdly, there must be arrangements for the frequent and regular change of air contained in the lungs. The special organs of respiration consist of the larynx, the trachea, the bronchi, and the lungs. For a description of the first two, see LARYNX; TRACHEA.

The two *bronchi* resemble the trachea in structure except that the incomplete rings are distributed on all sides of the tubes. The bronchi on entering the lungs divide into smaller and smaller branches until finally each minute branch terminates in a *pulmonary lobule*. The *smaller bronchi*, as they are called, lose their cartilaginous rings and the circular or transverse muscular layer forms a distinct coat. The mucous membrane is very delicate and lined with ciliated epithelium. Within the lobules of the lung the smaller bronchi divide still further into more minute branches and their structure becomes more delicate, until at last they consist only of a thin membrane lined by a single layer of squamous epithelium. At this point they widen out into small funnel-like air spaces (*intercellular passages*), the walls of which bulge irregularly in different places into small sac-like dilatations which are the *air cells* of the lungs. These air cells are from $\frac{1}{700}$ th to $\frac{1}{500}$ th of an inch in diameter. Their walls are very thin and are lined by a single layer of flattened cells continuous with those of the intercellular passage. The air vesicles of one lobule do not communicate with those of another, nor even with those of adjacent intercellular passages as a rule. Therefore any obstruction of a bronchus cuts off the supply of air to the lobule beyond. Elastic tissue fills in the space between the air cells and within this elastic tissue ramifies a dense network of capillary blood vessels which lies close against the air cells and which is separated from their contents by only

an extremely delicate membrane. It is here that the interlocking of gaseous elements between the atmosphere and the blood takes place.

The pulmonary lobules are bound together by connective and elastic tissue to form very much larger structures called lobes. Of these lobes the right lung presents three and the left two. Each lung is enveloped by a serous covering—the *pleura*—which is reflected from the lung at the point where the bronchus and great blood vessels enter and passing onward line the cavity of the chest. (See PLEURA.) In health there is no space between the layer of the *pleura* which covers the lung and that which lines the chest wall, but in disease or injury serum, blood, pus, or air may collect therein. These conditions are termed respectively *pleurisy with effusion*, *hæmorrhæthorax*, *pyothorax* or *empyema*, and *pneumothorax*.

In consequence of the great number of air cells which constitute their substance, cover 600,000,000, it has been calculated, the lungs (except in the fetal state, when no air enters them) are the lightest organs, in relation to their size, in the body. Although their bulk is so great that, with the heart, they occupy almost the whole of the cavity of the chest, they only weigh about three pounds and a half in men, and two pounds and three quarters in women. Their color varies at different ages. At birth they are of a pinkish white tint; in adult life they are of a slate color, and present a mottled appearance; and in old age they become of a still darker tint. The polygonal markings which are seen on the surface correspond to the outer surface of the lobules already noticed. Their shape is adapted to that of the cavity in which they are lodged, each lung being conical in form, with its apex rising into the neck, while its base, which is broad and concave, rests upon the convex surface of the diaphragm; and between the two lungs lie the heart and the great vessels that proceed from it. During life—except in certain diseases, as, for instance, pericarditis (q.v.)—the inner margins of the lungs nearly overlap the heart, leaving only a roundish space of that organ, less than two inches in diameter, uncovered, while their lower borders extend to the cartilages of the ribs, and fit into the angle formed between those cartilages and the diaphragm.

For the method by which the blood is perpetually changed in the lungs, see CIRCULATION.

For a description of the shape and framework of the chest, see CHEST. The chest (or thorax, as it is termed by anatomists) is so constructed as to be capable of enlargement in height (vertically), in depth (or from the front backward), and in width (or from side to side). Its height is increased mainly by the descent of the diaphragm, and to a certain extent by the elevation of the ribs and the widening of the intercostal spaces; while its depth and width are increased by the elevation of the ribs, which carry forward and elevate the breast bone (or sternum), especially at its lowest end, and are slightly rotated on an imaginary axis, joining their extremities, by which their central portion is raised, and slightly removed from the mesial plane of the chest. It is only in forced or deep inspiration that all these means of enlarging the chest are called into play. An ordinary inspiration is attended in men with very slight elevation of the ribs (about one twentieth of an inch), while in women the elevation is much greater, especially in the upper ribs, the

cause of this difference in the sexes probably lying in the narrower waist of the female requiring a compensation in the upper part of the chest. There are three varieties of ordinary respiration—viz.: (1) Abdominal, or that chiefly effected by the diaphragm, and seen in the motion of the walls of the belly; (2) costo-inferior, or that in which the seven lower ribs are observed to act; and (3) costo-superior, or that effected in a considerable degree by the upper ribs. The first variety occurs in infants up to the end of the third year; the second in boys after the age of three, and in men; and the third in adult females.

The following points in connection with the respiratory movements require notice. Every complete act of respiration is divisible into four parts—viz.: (1) Inspiration; (2) a short pause, not always observed; (3) expiration; and (4) a considerable pause, occupying, according to Vierordt, about one-fifth of the whole time required for one complete respiratory act. The act of expiration is always more prolonged than that of inspiration, the former being to the latter in the ratio of 12:10 in adult males, and as 14:10 in children, women, and aged persons. The number of respiratory acts performed in a minute varies at different ages. According to Quetelet, at birth there are 44 respirations in one minute; at 5 years of age, 26; from 15 to 20, 20; from 20 to 25, 18.7; from 25 to 30, 16; from 30 to 50, 18.1; so that from 16 to 20 may be taken as the ordinary range for healthy adults, although Hutchinson gives the wide range of from 16 to 40. The average ratio which the number of respirations bear to the number of pulsations in a given time is about 1:1½, and if there is any great deviation from this ratio, there is probably some obstruction to the aëration of the blood, or some disorder of the nervous system. Thus, in pneumonia (or inflammation of the lungs), in which a greater or less amount of pulmonary tissue is unfitted for its office, the number of the respirations increases in a more rapid proportion than the number of pulsations, so that the ratio becomes as 1:3, or even as 1:2. In hysteria a similar or even greater deviation from the normal ratio may occur; and Elliotson records a case in which the respiratory movements were 98, or even 106, while the pulse was 104. On the other hand, in certain typhoid conditions, and in narcotic poisoning, the respiratory acts are diminished in number, the ratio of respiration to pulsations being as 1:6, or even 1:8.

When the lungs have been emptied as much as possible of air by the most powerful expiratory effort, they still contain a quantity over which we have no control, and which may be estimated at about 100 cubic inches. To this portion of the contents of the lungs the term *residual air* is applied. In addition to this residual air, physiologists distinguish, in connection with the respiratory process, *reserve air*, which is that portion which remains in the chest after an ordinary gentle expiration, but which may be displaced at will; *breathing or tidal air*, which is the volume that is displaced by the constant gentle inspiration and expiration; and *complemental air*, or the quantity which can be inhaled by the deepest possible inspiration, over and above that which is introduced in ordinary breathing. The greatest volume of air that can be expelled by the most powerful expiration, which is obviously the sum of the reserve, breathing, and complemental air,

is designated as the *vital capacity*—a term originally introduced by Dr. Hutchinson, the inventor of the spirometer, who found, from nearly 5000 observations, that of all the elements or factors which might be supposed to influence it, *height* alone stood in a definite and constant relation to it, this relation being expressed by the rule that "for every inch of stature from 5 to 6 feet, 8 additional cubic inches of air (at 60° F.) are given out by a forced expiration after a full inspiration." Hutchinson found that 225 cubic inches is the average capacity of a healthy adult 5 feet and 7 inches tall. With regard to bodily weight as a factor, Hutchinson found that "when the man exceeds the average weight (at each height) by 7 per cent., the vital capacity decreases 1 cubic inch per pound for the next 35 pounds above his weight." Age and muscular development do not influence the result so much as might have been expected. It has been not unfrequently observed that the vital capacity is small in athletic men, and that it has been in excess in persons by no means remarkable for physical power. The *maximum* vital capacity met with by Hutchinson was 464 cubic inches; this was in a man 7 feet high, whose weight was 308 pounds; the *minimum* was 46 cubic inches, and occurred in the case of a dwarf whose height was only 29 inches and who weighed 40 pounds. The average inspiration in a healthy man at rest is about 50 cubic inches, and this increases with exercise of any kind. When we consider that the amount of air taken in at each respiration is only about one-seventh the capacity of the lungs, we see how slowly the air is renewed; but the law of the *diffusion of gases* (q.v.) here comes in play, for the air in the air cells and finer tubes being charged by the respiratory process with a great excess of carbonic acid, as compared with the inspired air contained in the larger tubes, a diffusion of the carbonic acid necessarily takes place in the outward direction, while the oxygen from the air, or the air itself, similarly diffuses itself in an opposite direction, toward and into the air cells themselves. The *total amount* of air which passes through the lungs in 24 hours must obviously vary with the extent and frequency of the respiratory movements. The total daily amount for a person at rest is 686,000 cubic inches. This quantity is largely increased by exertion.

The *alterations* in the inspired air effected by respiration consist essentially in the removal of a portion of the oxygen, and its replacement by a nearly corresponding bulk of carbonic acid. The amount of carbonic acid in the expired air varies inversely with the number of respirations; it reaches 5.5 per cent. (or more) when the respirations are only 6 in the minute, while it falls as low as about 2.6 per cent. when the respirations are 96 in the minute. About 4.35 per cent. of carbonic acid is, on an average, added to the air in ordinary respiration, while about 4.782 per cent. of oxygen is removed, the actual diminution of bulk of the expired air (after the removal of the moisture obtained from the lungs) being about one forty-fifth of its volume. Hence, unless where there is free ventilation, the air in an apartment containing men or animals must soon become vitiated by containing a great excess of carbonic acid (for ordinary atmospheric air only contains about one part of carbonic acid in 2500 parts),

and a deficiency of oxygen. The absolute quantity of carbonic acid (and consequently of carbon) exhaled in 24 hours is liable to great variations, caused by the temperature and moisture of the air, age, sex, muscular development, the nature and quantity of the food, muscular exercise, sleep, state of health, etc. Smith calculated that an adult man in a state of rest exhales in 24 hours an amount of carbonic acid equivalent to 7.144 ounces of carbon, and he estimated that it should be increased to 8.68 and 11.7 ounces for non-laboring and laboring persons respectively at their ordinary rate of exertion; that the total amount of carbonic acid is greatly increased by external cold, and diminished by heat; that it is increased by a moist, and diminished by a dry atmosphere; that it increases in both sexes to about the thirtieth year, when it remains stationary for fifteen years, after which it diminishes; that at all ages beyond eight years it is greater in males than in females, and that it increases during pregnancy; that it is greater in robust than in slender men, the quantity of carbon expired per diem to each one pound of bodily weight being (according to Smith) 17.07, 17.51, and 17.99 grains at forty-eight, thirty-nine, and thirty-three years of age respectively; that it is greatly increased by eating, and is diminished by fasting; that it is increased by muscular exertion (Smith found that when walking three miles an hour he excreted 2.6 more carbonic acid than when at rest, while tread-wheel labor occasioned about double the excretion that was caused by walking); that it was diminished by sleep; and that it is increased in the exanthematous fevers (measles, smallpox, scarlatina, etc.) and in chlorosis, while it is diminished in typhus and in chronic diseases of the respiratory organs. See MUSCULAR FORCE.

There has been much discussion with regard to the extent to which the nitrogen of the air is affected by respiration. Usually a small amount of this gas is given off, but the quantities absorbed and exhaled so nearly balance each other that its special action on the organism must be very trifling, further than as being a diluter of the oxygen, which would be too stimulating if breathed in a pure state. The amount of the watery vapor with which the exhaled air is saturated may range from about 6 to 27 ounces in 24 hours, its usual range being between 7 and 11 ounces. It is not pure water, but holds in solution a considerable amount of carbonic acid and an albuminous substance in a state of decomposition, which, on exposing the fluid to an elevated temperature, occasions a very evident putrid odor. See BRONCHITIS; PNEUMONIA; TUBERCULOSIS.

The well-known anatomical divisions of the lungs, known as lobes, are composed histologically of an enormous number of little lobes or lobules. Each lobule is separated from surrounding lobules by connective tissue, and the lobules which come to the surface of the lung are often distinguishable as little polygonal areas. Each pulmonary lobule consists of a single terminal bronchus and the group of air cells and spaces connected with that bronchus. The terminal bronchus on entering a lobule divides into several branches known as alveolar ducts. These open into considerably larger cavities called infundibula, from the sides of which the air sacs or

air cells open out like alveoles. The terminal bronchus is lined by a single layer of ciliated columnar epithelium. Outside of this are some elastic fibres and thin irregular bundles of smooth muscle cells. As the alveolar ducts are approached the ciliated epithelium is replaced by lower epithelium of the non-ciliated variety. In the alveolar ducts the epithelium is cuboidal, and the elastic tissue and smooth muscle are greatly reduced in amount. In the infundibulum

1. Trachea and bronchi. 2. Small bronchus showing air cell and lobule. 3. Ultimate bronchus of dog.

the epithelium consists mainly of large flat non-nucleated cells known as respiratory epithelium. Among these are scattered smaller polyhedral cells which are remains of foetal life and are called embryonal cells. Elastic tissue forms the supporting framework of the air sacs and forms a distinct ring around the mouth of each sac. In addition to the elastic tissue there is usually a small amount of fibrous connective tissue and some connective tissue cells surrounding the air sacs. Besides the parts just described, which may be considered as the parenchyma of the lung, there are seen in all sections of lung tissue bronchi of various sizes. The smaller bronchi are lined with a single layer of columnar ciliated epithelium lying upon a basement membrane. Beneath the latter is the stroma of the mucous membrane, outside of which is a circular layer of smooth muscle, the whole being surrounded by a connective tissue or fibrous coat. In the medium size and larger bronchi a distinct sub-mucous coat is present in which are imbedded the acini of mucous glands, while in the fibrous coat are situated various sized plates of hyalin cartilage. In the largest of the bronchi the epithelium, instead of consisting of a single layer, is made up of several layers, and there is an increase in the thickness of the muscularis mucosa and of the fibrous coat.

The blood vessels of the lung belong to two distinct systems; one, the bronchial system, is for the nourishment of the lung proper; the other, the pulmonary system, is for the purpose of exposing the blood to the air in the lungs. Both systems of vessels enter the lung at the hilus accompanying the large divisions of the bronchus. Within the lung the pulmonary system of vessels give off branches which correspond to the divisions of the bronchi, and on reaching the septa between the infundibula, break up into an extremely rich network of capillaries which surround the air sacs. At the margins of the air sacs the blood from the capillary network enters the radicles of the pulmonary veins, which

accompany the arteries to the surface of the lung. The bronchial system of vessels accompany the bronchial tubes and supply capillary networks to them and to the other structure of the lung. The lymphatics of the lung, like the blood vessels, consist of two sets. One of these originates in the lymph spaces of the interlobular connective tissue and in the subpleural lymph spaces, communicating by means of the latter with the surface of the pleura. The second set of lymphatics, the bronchial lymphatics, originates in the subepithelial lymph spaces of the bronchi, which communicate with the mucous surfaces of the bronchi and air sacs. From these spaces definite lymphatic channels are formed which follow the blood vessels to the surface of the lung and pass thence by means of a few large trunks to the bronchial lymph glands. The nerves of the lung come from both cerebro-spinal and sympathetic systems. The main nerve trunks enter the lung at the hilus and follow the branchings of the blood vessels and the bronchi. On arriving at the smaller bronchi the nerves break up into fine non-medullated fibrils which pass to the muscular tissue and to the mucous membrane.

RESPIRATION (in plants). A series of processes by which plants release the necessary energy for growth, movement, and similar work. Although the true nature of respiration was stated by Ingenhousz before the beginning of the nineteenth century and its relation to growth and the evolution of heat was clearly set forth by DeSaussure in 1824, confusion between photosynthesis and respiration has persisted to the present day.

The method of obtaining energy in the presence of free oxygen by oxidizing and decomposing materials within the body is known as normal respiration. The process of self-decomposition in the absence of free oxygen is known (inaptly) as intramolecular respiration; while the process of securing energy by the decomposition of the surrounding medium is designated as fermentation. Under ordinary conditions, almost all plants are able to absorb free oxygen from the atmosphere at all times. But if the absorption of free oxygen is impossible, the protoplasm may set up such changes in its own substance or in media adjacent to it as to secure the necessary energy by their decomposition. Some of the very simplest plants (anaërobic bacteria) have adapted themselves to this mode of life and flourish only in the absence of free oxygen. Others (bacteria, yeasts, molds, etc.) may live and grow in the presence of free oxygen, but when deprived of this actively decompose the substances with which they are in contact, which are then said to ferment or putrefy.

Normal respiration consists essentially of four independent processes: first, the absorption of oxygen; second, the union of oxygen with the substances to be oxidized; third, the decomposition of these substances, with the formation of various end products, differing according to circumstances; fourth, the elimination of these products. Its activity varies much with different plants and different parts of the same plant, and is influenced strikingly by external conditions. Considering only respiration occurring under favorable conditions, that of organs rich in protoplasm is more active than that of watery organs. Thus

growing points (buds), flowers, seeds, and so on respire more actively than fleshy leaves and tubers. The respiration of water and marsh plants is in general less active than that of land plants. The rate of respiration in active plant organs is several times greater per unit of weight than human respiration. The most active respiration recorded is that of young wheat leaves, which consume in 24 hours one gram of oxygen for each 0.1 gram of their weight. In human respiration one gram of oxygen is consumed per 100 grams of weight. Active aerobic bacteria may consume 200 times as much oxygen as that used by man per unit of weight. When the oxygen pressure is reduced to one-third its normal, respiration is retarded. Under increased pressure the results differ according to the duration of exposure. For a short time plants may respire normally at two to six atmospheres of pure oxygen. Under a longer exposure to such pressures respiration is likely to be retarded. Variations in temperature, which are frequent in nature, exert a double effect; as the temperature rises more oxygen is absorbed and more CO₂ is eliminated. With rising temperature respiration does not, as most functions do, attain a maximum and then diminish with further increase of temperature, but it is accelerated until death ensues. Yet the respiratory rate does not increase in direct proportion to the increase of temperature. Light appears to have little or no effect upon respiration.

INTRAMOLECULAR RESPIRATION. The exclusion of oxygen from plants which normally use it produces a profound disturbance of the usual metabolism, as shown by the fact that the end products of respiration, instead of being chiefly carbon dioxide and water, are alcohol, hydrogen, organic acids, etc. For most plants, a period of intramolecular respiration seems to be a time to be tided over, growth ceases, and most other functions are suspended. After the decomposition of the protoplasm has gone to a certain extent, death ensues. Therefore, at high temperatures, which accelerate the process, intramolecular respiration suffices to maintain life for a shorter time than at low temperatures. See FERMENTATION.

RESPIRATION, ARTIFICIAL. The exchange of air as in natural breathing (see RESPIRATION, ORGANS AND PROCESS OF), produced by mechanical means. Respiration is suspended when for any reason the muscles concerned in breathing are deprived of their wonted nervous stimulation, by poisoning of the nerve centres which govern them. This may take place in asphyxiation by poisonous gases, in drowning, poisoning, or by prematurely cutting off the placental circulation during parturition; and it is in these circumstances that artificial respiration finds its greatest usefulness. (See ASPHYXIA.) The object in resuscitation (q.v.) is to imitate as closely as possible the natural respiratory movements. These should be rhythmical and at the rate of twelve or fourteen to the minute. Several methods of carrying on artificial respiration have been devised. Of these the most generally useful is that of Sylvester. In this method the body of the person to be revived is placed upon the back, the shoulders being slightly elevated, and high enough to keep the chin from falling forward on the chest. The arms are then grasped

just above the elbows, and raised gently and steadily upward and forward to their full extent, and at the same time rotated slightly outward. This position is maintained for two or three seconds and secures *inspiration*. The arms are now lowered and pressed firmly against the sides of the chest for two or three seconds, thus bringing about *expiration*. These movements are repeated in alternation with regularity and precision, at the rate above mentioned. Sylvester's method is the one generally employed to resuscitate the drowned. Before proceeding with artificial respiration in these cases certain preparations have to be made. To drain off water from the stomach and chest, the patient is stripped to the waist and placed face downward with the pit of the stomach raised above the level of the mouth by a roll of clothing or other material placed transversely beneath the trunk. Pressure is then made upon the patient's back. The tongue must be held out, the larynx kept open, and the mouth and throat cleared of mucus. In cases of drowning efforts to resuscitate should be continued for at least an hour, apparently inanimate individuals having been brought to life at the end of that time, after having been immersed half an hour or longer. Attempts to restore respiration should be supplemented by friction, the administration of stimulants, and the application of heat to the abdomen and lower extremities.

Schultz's method, applicable especially to the resuscitation of newly born infants, is as follows: The operator stands behind the patient. The shoulders are grasped, with an index finger in each armpit, the thumbs over the shoulders, and the rest of the fingers resting obliquely over the back. The whole weight of the child's body is now allowed to hang from the shoulders. This lifts the ribs, expands the chest, and produces mechanical inspiration. Expiration is produced by swinging the child forward at arms' length to a point where the lower limbs and pelvis teeter over toward the operator, thus bringing about extreme flexion of the trunk, and forcing the abdominal viscera against the diaphragm. This motion is then reversed, and the process repeated at the rate of eight or nine times a minute.

In the method of Byrd-Dew the neck is supported by one hand, the thighs upon the other, the child lying upon its back. The head is allowed to fall backward so that the glottis may remain freely open. The body is then alternately extended and flexed, which movements determine respectively inspiration and expiration.

Fell's method of artificial respiration consists in pushing a tube into the larynx and trachea, and forcing warmed air into the lungs by means of a bellows. Expiration is secured by pressure on the sides of the chest.

Gibbons's method, which is applied by its author to cases of apparent death from electricity, consists of inserting one end of a tube into a nostril of the inanimate person and then, after closing the other nostril, working two bellows alternately so as to exhaust the air in the lungs and then supply fresh air under pressure.

Labordle's method depends on rhythmical traction of the tongue. This organ is seized, as far back as possible, between the thumb and index finger wrapped in linen, and alternately pulled forcibly forward and relaxed. This method is supposed to excite breathing by reflex action.

A practicable and very useful method especial-

ly for young children is mouth to mouth insufflation. A piece of gauze is laid over the mouth of the child and air breathed directly into its lungs from those of the operator.

RESPIRATORY SOUNDS. Sounds produced during inspiration and expiration as perceived by auscultation, either by placing the ear upon the chest or through the medium of the stethoscope (q.v.). When the ear is placed upon the chest of a healthy adult, a soft, rustling sound is heard, comparable to the sighing or a gentle breeze among the leaves. This sound is louder and more marked during the inspiratory act, which is in health longer than expiration in the ratio of 6.5. To this sound the name *vesicular murmur* has been given. Certain areas of the chest, here the large bronchi are nearer the surface, viz. over the sternum, the junction of the first costal cartilage with the sternum, and a diamond-shaped space at the back in the middle line, the sound becomes tubular, and higher pitched, and expiration and inspiration are of equal length. This is called bronchial breathing and is significant of disease when it occurs elsewhere than over the areas above indicated. Where these two sounds shade into each other, *broncho-vesicular* breathing is heard.

In pathological conditions of the lungs, the vesicular murmur undergoes many important modifications. It is, for example, diminished or completely obliterated in pleurisy (q.v.) with effusion and in pneumothorax; it becomes louder and higher in pitch over consolidated lung tissue such as occurs in pneumonia and pulmonary tuberculosis (q.v.). One of the earliest physical signs of phthisis is a prolonged respiratory murmur, and this alteration of the normal rhythm is also characteristic of asthma and emphysema (q.v.). Interrupted breathing, sometimes called *cop-wheel respiration*, is heard in healthy but nervous individuals, but in disease it is caused by the breaking of the column of air passing through the bronchials by tenacious mucus, or by the expansion of different lobes at different times.

Certain adventitious sounds to which the generic name *râles* is applied are heard in disease, and are produced either in the bronchial tubes or air vesicles. Dry râles are whistling, squeaking sounds, caused by the passage of air through bronchial tubes narrowed in places by swelling of the lining mucous membrane, as in bronchitis, or by spasm, as in asthma; or by tough, adherent mucus. Moist râles are produced by the expansion of previously closed air cells, or by the passage of air through fluid in the bronchial tubes or in a cavity. These are heard in tubercle, the resolving stage of lobar pneumonia, pulmonary œdema, etc. *Metallic tinkling* is a sharp, quick sound resembling that produced by striking a glass vessel with a pin. Its presence gives evidence of the presence in the lung of a cavity of considerable size containing air, and surrounded by firm walls. A *traction sound* is produced by the rubbing together of the visceral and parietal layers of the pleura when rough from inflammation, and is indicative of pleurisy. Consult Loomis's *Physical Diagnosis* (New York, 1902). See AUSCULTATION.

RESPIRATORY SYSTEM, COMPARATIVE ANATOMY OF THE. The system of organs that have the function, in the animal body, of taking in oxygen from the surrounding medium (qv. r

and in that of getting rid of carbon dioxide gas and certain other excrementitious products. In Vertebrata these organs are either gills or lungs. In invertebrates the skin always functions, more or less, as a respiratory organ, and in addition various other organs subservise this function also. Whatever form or position the respiratory organ may assume, it must be richly supplied with blood vessels so that the blood containing carbon dioxide may come in close relation with the surrounding medium. No organ may be spoken of as a respiratory organ which has not this vascular apparatus. Specialized respiratory organs do not appear in the animal kingdom until the segmented worms are reached, and even in many of the segmented worms no specific respiratory apparatus is developed. The integument of lower forms and sometimes the wall of the intestine, when this organ is present, perform the respiratory function; the integument is better able to do so, since it is the part that comes most intimately in contact with the surrounding media.

In echinoderms there are no respiratory organs that are homologous throughout the phylum. In holothurians this function is performed by the 'respiratory tree,' a mass of delicate branched tubules which open into the cloaca; by the oral tentacles; and by the entire body-wall. In the other forms various other organs perform this function.

Mollusks, as a rule, have one (in a few cases more than one) pair of breathing organs, the gills, which are covered and protected by the mantle. In some forms this gill is wanting and in others it is functionally replaced by other and phylogenetically newer organs. Blood flows into these gills and after taking in oxygen from the water it flows back again, first to the heart and then to all parts of the body. The lamellibranch gills appear double on account of the strong development of the two rows of branchial leaflets, and in some mollusks increased surface is obtained by a folding of the leaflets. Scaphopoda and many Gastropoda do not possess true gills. In certain cases they are replaced by adaptive gills. The latter may be delicate leaflets forming a rosette around the anus; or folds to the right and left in the mantle cavity; or cerata, the dorsal finger-like processes of Nudibranchiata. Some Pulmonata have become adapted for aerial breathing. In this case the mantle cavity is richly supplied with blood vessels in its dorsal wall and gains a respiratory aperture, the so-called 'lung.'

Respiration in all Crustacea takes place in the outer integument. In small Crustacea there are no specially developed respiratory organs, and respiration is performed by the entire body surface. In the large Crustacea certain parts of the body are adapted to perform this function more actively than others. To fit such parts of the body for a respiratory function folds of the integument arise and the soft skin of the folds is functional in respiration. When this fold is transformed into a hard shield, it serves to protect the delicate breathing organs. The function of respiration is performed in most Crustacea by the thoracic limbs. Some of the crabs live more or less on land and are adapted to retain water in the branchial cavity and to breathe the air directly. In the latter case the part of the branchial cavity that functions as a lung has its

integument modified into branched tufts which project into the air cavity and are well provided with vascular organs.

The respiratory organs of insects are segmentally arranged air-conducting tubules, the tracheae, which connect with the exterior by means of segmental openings, the stigmata. These openings are often guarded by bristles or tufts to keep out foreign particles. Internally the tracheal tubes branch and subdivide again and again and penetrate all through the tissues of the body. The tracheae are lined by chitinous spirals to keep the tubes open. This chitin is continuous with the chitin of the exoskeleton and is shed with the latter.

In Amphioxus more than the first half of the length of the alimentary tract is devoted to the purposes of respiration, since its walls are provided with gill-slits. This may be called the respiratory part of the alimentary tract (prosenteron) in contradistinction to the remainder, hinder portion, the digestive part. Gill-slits to the number of 100, more or less, are borne by it. The variability in number is due to the fact that gills continue to increase in number as the animal grows older, new ones being formed posteriorly. In Ammocoetes, of the Cyclostomi, there is a muscular fold at the posterior end of the branchial part of the oesophagus. In Petromyzon that part of the oesophagus which contains the gills is entirely cut off from the alimentary tract and the cut-off end of the latter grows forward above the gill-portion to join the mouth cavity. Thus two canals pass backward from the mouth. From Elasmobranchii onward the gills are in close relation with the skeletal parts of the visceral arches. As a rule teleosts possess four gill-arches, but certain rudimentary gills on the mandibular and hyoid arches indicate that fishes formerly possessed more gill-arches than at present. Fishes take in water through the mouth, and by a constriction of the latter force it out through the gill-slits. During the process of breathing the gill-arches rise and fall. The Dipnoi, as the name indicates, breathe both by gills and by lungs. The lung-sac of the Dipnoi is an unpaired bilobed sac.

LUNGS. The air-bladder and lungs have a similar development and the latter has developed from the former. Both are outgrowths of the alimentary tract; the air-bladder is usually formed on the dorsal, and the lung on the ventral side, however. The point at which the air-bladder arises from the oesophagus is not a fixed one, and the duct which connects the bladder with the oesophagus may remain open, may be reduced to a solid strand, or may eventually disappear altogether. In the last case the air-bladder probably gets its contained gas from its own wall. The air-bladder always lies above the alimentary tract. In a few cases it is paired. It may be transversely constricted to form several divisions, or caecal processes may be present. The internal surface of the air-bladder of fishes may be spongy, a condition similar to that of the lungs of Dipnoi and Amphibia. The lungs of some of the Dipnoi show posteriorly a paired condition, although anteriorly there is only one part. The lungs of certain Amphibia (*Menobranchius* and *Proteus*) are lower in development than those of the Dipnoi in so far as their internal surface is smooth. In reptiles and in the other vertebrates the form of the lung is determined by that of the body.

The lungs show a branched system of bronchi. In this respect the lungs of crocodiles and some other forms show a decided advance over those of Amphibia. The lungs of birds (q.v.) are in connection with large sacs, the 'air-sacs.' These air-sacs fill the interstices in the body cavity, pass between the muscles, under the skin, and even into the hollow bones.

In man the lungs of the two sides are not symmetrical; the right lung has three lobes, the left two. They are connected with the exterior by the air passages composed of the bronchial tubes, trachea, larynx, and windpipe. This system of organs arises on the ventral side of the œsophagus as a duct, and constricts off to form a distinct tube. The separation begins anteriorly. The lungs arise as lateral buds at the posterior end of the furrow. Cartilaginous supports first arise in Urodeles. Definite tracheæ appear in Sirenia, Amphiuma, and Gymnophiona. The cartilaginous bands take on the form of half rings first in the Gymnophiona. A differentiated larynx appears in the Anura, is regulated by muscles, and has vocal cords. The larynx of reptiles makes no advance over that of Anura, but in crocodiles and turtles the larynx is imbedded in a depression of the hyoid. The thyroid cartilage of mammals is supposed to have been derived from a part of the hyoid. In birds two larynges are present, the lower of which, the syrinx, is the functional voice organ and is restricted to birds alone.

Consult: Lang, *Text-Book of Comparative Anatomy* (London, 1891-96); Weidersheim, adapted by W. N. Parker, *Comparative Anatomy of Vertebrates* (London, 1897).

RESPONDENT (from Lat. *respondere*, to answer, from *re*, back again, anew + *spendere*, to promise). A party who is called upon to answer in proceedings against him in certain courts. A person who is sued in an admiralty court, or in a court of chancery or equity, is known as the respondent. In this sense the term corresponds to the word defendant. The term is also applied to one who opposes an appeal, and in that sense it is the opposite of appellant. In the English divorce courts the defendant is known as the respondent. See APPEAL.

RESPONDENTIA (Neo-Lat., from Lat. *respondere*, to answer). A term employed in maritime law to denote a loan of money on the whole or a part of the cargo of a ship, and conditioned to be paid with 'maritime interest' when the cargo is safely delivered at the port to which it is consigned. A respondentia bond is commonly given as evidence of the contract. The lender of the money assumes the risk that the goods may be lost at sea, and if such casualty occurs he loses the amount he has advanced. If there is a partial loss the lender is entitled to have the goods which are saved sold for his benefit. The loan is practically only on the personal security of the borrower, as the goods may be sold by the latter free from any lien at any time during the voyage or upon their arrival. The advantage which accrues to the lender in consideration of the unusual risk he assumes is that he may contract for practically any rate of interest which the borrower is willing to pay. See BOTTOMRY BOND; USURY. Consult the authorities referred to under ADMIRALTY LAW.

RESSEL, res'sel, Jostum (1793-1857). An Austrian inventor, born at Chrudim, Bohemia, and educated at Vienna and at Marabrunn. In the latter place he studied forestry, and from 1817 until his death he held various posts in the Austrian Department of Forestry, being stationed for some time at Ennst. Ressel was an able mechanic and invented several machines. His claims to the discovery of the screw propeller, which he did not patent, owing to an unfortunate accident at the final trip of the screw steambent, rival those of Sauvage, Ericsson, Smith, and Wilson. Consult Reiffinger, *Joseph Ressel* (Vienna, 1863).

REST (AS, *rest*, *rast*, Goth., OHG, *rusta*, Ger. *Rast*, rest; ultimately connected with Skt. *raam*, to rest, to reject). In music, an interval of silence occurring in the course of a movement between one sound and another. With the use of measurable music (q.v.), rests began to be represented by regular fixed signs, and finally the following values were one after another decided on:

Ultimately the tails of the shorter notes were reversed and thus our present rest characters came into use. The following are the principal rest characters:

For rests of a number of bars, it is now usual to draw one or two oblique lines across the staff, and write on them in figures the number of measures during which the voice or instrument is to be silent; thus 5 in common time, denotes a rest of 5 whole notes. A rest, like a note, may be prolonged by one or more dots.

REST-CURE. A system of treatment inaugurated about 1870, after the recognition of the success of Prof. Samuel Jackson, by Dr. S. Weir Mitchell (q.v.) of Philadelphia. It is calculated "to renew the vitality of feeble people by a combination of entire rest and excessive feeding made possible by passive exercise obtained through the steady use of massage and electricity." The cases most benefited by such treatment are those of women who are 'nervous,' thin, and anæmic, partial or entire invalids. Seclusion from relatives and friends; absolute rest in bed for six weeks or more; neither reading, writing, nor sewing, and often not raising the hand or turning over in bed without aid; massage of the entire body except the face every day for six weeks; the use of the induction current with slow interruptions over the whole of the body but the face and neck during forty to sixty minutes each day; together with large quantities of milk, cocoa, and malt extract combine to make up the treatment. While rest cure is especially suitable to the thin, it also benefits cases of 'fat anæmia' and the large majority of neurasthenics. It has also been of great value in indigestion and

alcoholism, and some early cases of tuberculosis. Rest-cure is employed in modified form by many physicians. Consult Mitchell, *Fat and Blood* (Philadelphia, 1877).

REST-HARROW. A popular name for several species of European herbs and subshrubs of the natural order Leguminosæ. Common rest-harrow (*Oxalis arvensis*) is sometimes abundant in neglected pastures, but is easily controlled by cultivation. Yellow rest-harrow, or goat's rue (*Oxalis Atrix*), is sometimes grown for ornament.

RESTIGOUCHE, rēs'tō-gōōsh'. A river in the northwestern part of New Brunswick, Canada, forming for about 50 miles the boundary between that province and the Province of Quebec (Map: New Brunswick, B 2). It is 200 miles in length, and falls into Chaleurs Bay in the Gulf of Saint Lawrence. For the last 18 miles it is navigable for the largest ships.

RESTITUTION (Lat. *restitutio*, from *restituere*, to restore, from *re*, back again, anew + *statuere*, to place, from *stare*, to stand). In law, return to the rightful owner of property which has been unlawfully detained. The term is applied alike to cases where the property has merely been converted to the use of some one under a claim of title, and where it has been stolen. In the United States, where there is doubt as to the identity of the property, the issue should be decided by a replevin action. (See REPLEVIN; EXECUTION.) The term is also applied to the restoration of a part of a cargo which has been lost by jettison. See MARITIME LAW.

RESTORATION (Lat. *restauratio*, from *restaurare*, to restore, from *re*, back again, anew + **staurus*, GK. *σταυρός*, firmly fixed, stake; connected with *stare*, to stand, Skt. *sthāvara*, fixed, *sthā*, to stand). A term employed in the history of England and France in connection with the reestablishment of monarchical government. In England it is applied to the accession of Charles II. In France the term is applied to the accession of Louis XVIII. in 1814, after the abdication of Napoleon (First Restoration), and after the 'Hundred Days' in 1815 (Second Restoration).

RESTORATIONISTS. A sect which, under a new name, has revived a very ancient doctrine, which has found advocates at all times since the days of Origen (q.v.). One of the most remarkable doctrines of that Father was his belief of a general *apokatastasis*, or 'restoration' of all things, in which, after a purgation proportioned to the various moral conditions of their souls at the time of death, all men, however wicked, and all the evil angels, even Lucifer himself, would be restored to the favor of God, and reunited to Him in heaven. This doctrine was condemned at the time, and has since been repeatedly rejected by the churches of the East as well as of the West. The doctrine has been renewed in more than one form since the Reformation by various classes, who have taken the name of Universalists (q.v.). The particular title of Restorationists was given in the United States to the followers of the Rev. Hosea Ballou (q.v.), who, in addition to the tenet above explained, held that all retribution is confined to this life, and taught that at the resurrection all men will be admitted to everlasting happiness.

RESTORATION OF PAINTINGS. To restore a painting to its original condition is a delicate operation, requiring great knowledge and skill. By the operation of ignorant restorers of the past many of the most important paintings have been destroyed; indeed, it is a question whether restorers have not inflicted more damage than time itself. In former times the process was chiefly one of repainting and it was then that the chief damage was done, even though the artist himself was often a man of ability. One of the most difficult tasks of the modern restorer is to remove these outer coatings of paint.

The first step in the process of restoration is to clean the picture—i.e. to remove the coating of dust with which it has become encrusted, or the varnish originally applied, which in the course of time becomes dust color or opaque. The usual process is to dissolve the varnish by means of brandy, weak alcohol, or some similar substance applied with the sponge, oil also being frequently applied to prevent deleterious action upon the colors. In Germany the process invented by the celebrated Bavarian chemist Max von Pettenkofer (q.v.) is often applied, which consists in subjecting the painting to cold fumes of alcohol. Unvarnished paintings are in like manner carefully washed with brandy, vinegar, or some similar substance.

The transferring of a painting from a damaged canvas, panel, or wall is effected by gluing it to a paper plaque fastened on gauze. The canvas or wood is then carefully removed by means of instruments and chemicals, and the painting is glued to a new canvas, after which the paper is removed from the surface of the painting. In case of a fresco the paper is rolled upon a cylinder while the plaster is being removed with a chisel. The retouching of the parts of the painting damaged during the restoration with dry color is an important process, which should be intrusted to most skillful hands. The glass plates now used instead of varnish in most modern galleries, though superior as a protection to the painting, have the disadvantage of preventing the study of the ensemble of the picture by their reflective powers.

RESTRAINT OF TRADE, CONTRACTS IN. It has always been regarded as contrary to the policy of the common law that one should deprive himself of the right to engage in business or trade, and all contracts entered into for that purpose have with certain limitations been regarded as illegal and consequently null and void. Thus a contract that one would never engage in his business or trade within ten miles of London was deemed valid and enforceable, but a contract not to engage in any particular trade or business in England for five years was considered illegal as against public policy. The later tendency of the English courts is to test the validity of the contract by its reasonableness in view of all the circumstances of the case irrespective of any arbitrary rule as to time and space. The early decisions of the United States followed the early rule of the English courts. Later decisions recognize that the United States constitute practically one country for purposes of trade, and consequently do not hold contracts in restraint of trade invalid when the restraint extends over an entire State, or indeed over nearly all of the United States. The Sherman Act of 1887, which

is applicable, however, only to persons and corporations engaged in interstate commerce, forbids pools or combinations for the division of traffic. The modern tendency in the United States is, as in England, to make the test of reasonableness of the restraint depend on the character of the business and the special circumstances of the case. Contracts for the purpose of creating so-called corners in the market of any commodity of general or necessary use have always been held void as unlawfully restraining trade, and contracts unreasonably in restraint of commerce are deemed void on the same principle. See TRUSTS.

Congress, acting under the constitutional power to regulate commerce, has passed an act known as the Sherman Act (26 U. S. Statutes at Large, 209) declaring that all contracts and combinations in restraint of interstate or international commerce are illegal and void. In construing these statutes the United States Supreme Court has held that all contracts directly restraining commerce, interstate or international, whether such restraint be reasonable or unreasonable, are illegal, thus changing the common-law rule, that the restraint must be unreasonable in order to invalidate the contract. See CONSPIRACY; COMBINATION; COMMERCE; MONOPOLY; STRIKES; TRUSTS.

Consult the authorities referred to under CONTRACT; and Jolly, *Contracts in Restraint of Trade* (2d ed., London, 1900); Matthews, *Covenants in Restraint of Trade* (London, 1893); Shelling, *Trusts and Monopolies* (Boston, 1893); Stickney, *State Control of Trade and Commerce* (1897).

RESTREPO, rá-strá'pó. JOSÉ MANUEL (c.1775-c.1860). A South American historian and politician, born in New Granada (Colombia). He wrote *Historia de la revolución de la república de Colombia* (1827), which includes an appendix containing several original documents. As he took a personal part in the events described, the work has an especial value, and it is written in a judicious and impartial style. Restrepo was Secretary of State under Bolívar.

RESTRICTIVE COVENANTS. Covenants in conveyances which bind the purchaser to use the land conveyed thereby in some particular way, or which prohibit him from making use of it for certain designated purposes. Common examples of such covenants are: the restrictive clauses in deeds prohibiting purchasers from building beyond an imaginary 'house line' on the land, that is, within a certain distance from the street; or prescribing the character of the buildings which they shall be permitted to erect thereon. Restrictive covenants create equitable easements in favor of the owner of the land for the benefit of which they are made; and "run with the land," that is, continue to operate in favor of all subsequent owners of that land. It is by restrictive covenants that the character of the improvements on real estate in suburban towns and additions is fixed. The class of people, the character and minimum cost price of buildings, and the purposes for which they may be used, may thus be regulated. Consult Washburn on *Real Property*, and on *Easements*; Jones on *Easements*.

RESURRECTION (Lat. *resurrectio*, from *resurgere*, to rise again, from *re-*, back again, anew + *surgere, surrigere, subrigere*, to rise, from *sub*, under + *regere*, to direct, rule). The

restoration of man after death to the full possession of his powers and faculties. In one form or another, this conception is found among Mazdayasians, Jews, Christians, and Mohammedans. As to the time, manner, and subjects of the future change there has been much difference of opinion. While the prevailing view has generally been that the dead will rise simultaneously on the last day, there are great religious teachers who have regarded the resurrection as taking place in the case of each person immediately upon death. The resurrection has been conceived of as an awakening from the sleep of death; a reanimation of the body; a restoration of the body by the coming together of the particles that constituted it at the moment of death; a creation of a new body in harmony with the perfected spiritual character; a clothing of the departed spirit with a spiritual body descending from heaven; or a development of the germ of a spiritual organism already existing within the physical body before death. Some have maintained that all men, regardless of nationality, religious belief, or character, will be raised from the dead, while others have held that only members of a particular nation, the adherents of a certain form of religion, or the possessors of a good character will be deemed worthy to share in the resurrection.

Whether the idea of a resurrection originated with Zoroaster, already existed before his time in Iran, or was developed by his disciples cannot be determined with certainty. In its most concrete form it is met in the later parts of the Avesta (q.v.) and in the Bundahish. Here all men are to be raised on the last day by the Saoshyant (q.v.), or Saviour, and those who are living at that time are to be endowed with immortality, the bodies of the dead being brought together from the different elements in the course of fifty-seven years. It is on the whole most probable that there existed a popular belief in a future resurrection already before the time of Zoroaster. The custom of leaving the dead in the field to be consumed by wild beasts, without building for them a house, goes back to extreme antiquity. While such a practice might seem to preclude ancestral cult and the hope for immortality, the unimpeded return of the body to the different elements of nature apparently made the worship of ancestral spirits less a matter of ceremony, and in connection with the idea of a coming destruction and renovation of the world, led the Iranian mind to expect a reconstruction of each human being from its constituent parts scattered among the elements. That this occurred at a very early period is rendered probable by the emphasis put upon the future life by such Iranian peoples as the Scythians and the Thracians, who must have left the common home at a remote epoch. We have positive evidence that this doctrine was taught in the Achaemenian period in a work of Theopompus, the historian of Philip of Macedon, used and quoted by Diogenes Laertius, Eneas of Gaza, and probably Plutarch, Herodotus and Xenophon probably also heard of it, though they emphasized only the belief in immortality on the part of the Persians.

In early Hebrew thought there is no trace of this conception. It is unknown alike to prophets, legislators, and poets. The third chapter of Genesis no doubt reflects the attitude of large

circles in Israel; if man had been allowed to remain in the Garden of Eden he might have continued his existence indefinitely by the magic virtue of the life-giving fruit; but as he was driven out of the garden, he returns to dust and is no more. Nevertheless, the survival of ancestral worship and necromancy shows that to many minds there were exceptional personalities rising above the average lot of the shades in Sheol (q.v.), still possessing high rank, power over the living, and supernatural insight. The valley of bones in Ezekiel xxxvii. does not suggest, but rather precludes, familiarity with the doctrine of a resurrection. In Job xix. 25-27 the text has evidently suffered much in transmission, but the whole trend of the thought clearly shows that there can be no reference to either a life beyond or a resurrection. The possibility of such a return to life is emphatically denied in chapter xiv. The first reference in Hebrew literature to the resurrection is found in the Book of Daniel, written in B.C. 165. According to Daniel xii. 2, some of those that sleep in the dust are to be raised. Evidently the Maccabean martyrs and the apostates are intended. An apocalypse written c. 110 B.C. and preserved in Isaiah xxvi. declares that Yahweh's dead shall live and his dead bodies shall arise, for his dew is a dew of healing and the earth shall cast forth the dead. Whether all Israelites are meant is uncertain. Within the canonical Old Testament these are the only passages that show an acquaintance with the doctrine. How long before the year B.C. 165 it became known in Israel we have no means of determining. In the earliest part of the Book of Enoch, written c. 108 B.C., there is an allusion to some who are neither slain on the judgment day nor raised from the place of torture (xxii. 13). The resurrection is apparently limited to righteous Israelites. This is clearly the conception in Enoch xci. 10; xcii. 3-5, written c. 88 B.C.; in the Psalter of Solomon iii. 12, xiii. 11, xv. 9, xv. 13, written c. 60 B.C.; in II. Maccabees vii. 9, 14, 23, 29, 36, xii. 43, 44, written c. 20 A.D.; and in the Testaments of the Twelve Patriarchs, Jude xxv., and probably originally in Benjamin x. A number of apocalyptic works written apparently in the reign of Domitian seem to contemplate a universal resurrection. This is most clearly the case with IV. Ezra vii. 32; probably also with Baruch xlii. 7, l. 2, li. 1 (though in xxx. the resurrection is limited to the just), and with Enoch li. In the Apocalypse of Moses, which in reality is a life of Adam and Eve, the resurrection of the whole human race is clearly taught (x., xiii., xxviii., xli., xliii.), the addition "all that are a holy people" in xlii. being probably an interpolation; also in Sibylline Oracles ii. 214-237, written c. 200 A.D. The prevailing view, however, in the Talmudic and Midrashic period was that the heathen would not rise from the dead, but that the resurrection would be only for the righteous. Whether this would include all Israelites was a mooted question, the opinion being frequently expressed that some classes would be excluded. Thus the Mishna tract *Sanhedrin* xi. 1 excludes from the world to come those who deny the resurrection of the dead and the divine origin of the law as well as the Epicureans, while it records the opinions of Rabbi Akibah, who excluded also those reading non-canonical books, and of Abba Shaul, who added any person pronouncing improperly the name of Yahweh (see *Jinovan*), and *Kethub-*

hoth 111 b distinctly states that "the people of the land [i.e. the unlearned] shall not be raised to life." Before the third century A.D. the resurrection is always a work of God Himself. But Rabbi Samuel taught in the name of Rabbi Jonathan that the righteous would raise the dead (*Pesachim*, 68). Later it was held by many teachers that the Messiah would raise the dead. The general opinion was that resurrection would occur in Palestine. Even the Jews who had died outside of the holy land were supposed to be led through subterranean passages to Palestine, where they were to be raised (*Pesiktah rabbath* i.). Many supposed that of the human body one bone would never molder into dust, and that from this 'almond of the spine,' or *os sacrum*, the resurrection body would be formed (*Bereshith rabba* xxviii.).

There probably never was a time when the belief in a resurrection was universally held in Israel. While it was championed in one form or another by the Pharisaic party, it was strongly opposed in many circles. It is not known or accepted by the authors of Ecclesiasticus, Judith, Tobit, and I. Maccabees, and it is of course emphatically denied by Ecclesiastes. The Sadducees adhered to the old idea of Sheol and rejected the doctrine of a resurrection. The Samaritans seem to have maintained the same attitude in earlier times, though they subsequently accepted the doctrine. (See SAMARITANS.) The Essenes cherished a view concerning the nature of the soul and the future life closely resembling that of the Pythagoreans, ultimately due to Indian or Persian influences, according to which the soul has existed before birth and will exist eternally after its bondage to the body is ended. A similar view was held by Jewish Gnostics. Where Greek thought prevailed the idea of immortality (q.v.) was accepted rather than that of a resurrection. This may be seen not only in the Wisdom of Solomon iii. 1-9, iv. 7, v. 16, vi. 20; IV. Maccabees xvii. 5, 18, xviii. 3; and Philo, *De vita Mosis* ii. 633, *De Abr.* 385; *De Somn.* 586; *De migratione* 407, but also in Palestinian works like *Jubilees* xxiii., xxv., and Slavonic Enoch lxx. 8, 9, 10, lxxi. 7. Even where the term was kept, the idea of a resuscitation of the physical body was abandoned, as by Josephus (cf. especially *Bel. Jud.* iii. 8, 5) for the thought of an endowment with a spiritual organism. As a result of contact with Arabic learning, there was an unmistakable tendency to substitute the doctrine of a natural immortality of the soul for that of a resurrection of Israel only. It was not wrongly that Maimonides was accused of having set aside completely the doctrine of a resurrection in his *Mora Nebuchin* or "Guide of the Erring." Modern Judaism has been largely determined in this as in other respects by Moses Mendelssohn, whose work, *Phädon oder über die Unsterblichkeit der Seele* (1767), made a profound impression on his age.

The attitude of Jesus on this question cannot be determined with certainty. Aside from Luke xiv. 14, which, if genuine, shows that Jesus looked forward to a recompense at the resurrection of the just, there is but one saying of His recorded in the Synoptic Gospels that has any direct relation to the subject. This is found variously reported in Matthew xxii. 23-32, Mark xii. 18-27, and Luke xx. 27-38. Jesus evidently rejects the view of the Sadducees on the ground

that they do not understand the Scriptures and fail to appreciate the power of God. On the other hand, He clearly does not accept the current Pharisaic doctrine of a resurrection on the last day, since He based His argument for the fact that the dead are raised on the words of Yahweh to Moses in which He speaks of Himself as the God of Abraham, Isaac, and Jacob. The point of the argument is that, according to the Scriptures, these patriarchs were addressed as living several centuries after their death, and therefore must have been raised from the dead; and the natural inference is that Jesus believed in a spiritual resurrection by which those to whom God stands in relation as their God are immediately after death raised into life to be in His presence forever. Concerning those who shall be accounted worthy to share in the resurrection, He further stated His conviction that they would neither marry nor be given in marriage, but be like the angels. His warning, "Fear ye him who is able after he has killed to slay both body and soul in Gehenna," also seems to indicate that He limited the resurrection to those who should be accounted worthy. See GEHENNA; HELL.

A new assurance of a resurrection to a blessed life beyond was given to those who became convinced that Jesus had been raised from the dead. Unless it can be proved that certain of the older Epistles ascribed to Paul are not genuine, there is positive evidence that not much more than twenty years after the death of Jesus a glorious figure appeared in a vision to Paul and was identified by him as the crucified Nazarene and that Paul had heard of similar visions seen by Peter, James, and others (1. Cor. xv. 4-8). This conviction revolutionized Paul's life and caused him to see in the resurrection of Jesus the guarantee of an eternal life and the sole reason for righteous conduct in this life. While the important passage in 1. Corinthians xv. contains no intimation of an empty tomb, and cannot be pressed as proving a physical resurrection or an appearance to women, the earliest Gospels, Matthew and Mark, written in the main before the end of the first century, suggest that Jesus first appeared to His disciples in Galilee, and that some women had found the tomb empty, but said nothing about this because of fear. The later Gospels, Luke and John, make Jerusalem the place of the first appearance of Jesus to His disciples and strongly emphasize the physical character of the resurrection body while ascribing to it functions impossible to a physical body.

In the conflict with Gnosticism, which denied the resurrection, the Church found it necessary to give added emphasis to the resurrection of the flesh. Hence the earlier creeds, which simply affirmed a belief in a resurrection or an eternal life, were gradually changed into the formula 'the resurrection of the flesh,' found in the Apostles' Creed. Since the thought of a resurrection of the wicked as well as the good sporadically occurs in the New Testament (as in John v. 28, Acts xxiv. 15, Heb. vi. 2, Rev. xx. 13), the idea of an interval between a first resurrection of believers and a second resurrection of the rest of mankind developed, and was especially cherished by those who looked forward to a thousand-year period of Messianic rule. See MILLENNIUM.

Through the influence of Greek philosophy the doctrine of the natural immortality of the human soul (see IMMORTALITY) became so important a

part of Christian thought that the resurrection naturally lost its vital significance, and it has practically held no place in the great systems of philosophy elaborated by Christian thinkers in modern times.

The doctrine of the resurrection was adopted by Mohammed from Jewish or Christian sources and adhered to both by Sunnites and Shites. It was subject of grave doubts by Moslem thinkers in the times of the Bagdad caliphate, but is to-day generally accepted.

RESURRECTION. A sombre and powerful novel by Tolstoy (1899), treating of the problems of Russian life of today, and arraigning especially the Russian judicial prison system. The theme is the repentance of a nobleman who as a juryman is called on to try a girl whom he had previously ruined. Impressed with the injustice of their relative conditions, he gives up his life to atonement with the result that both he and his victim are regenerated.

RESURRECTION PLANT. See ROSE OF JEREMO.

RESUSCITATION (Lat. *resuscitatio*, from *resuscitare*, to raise again, revive, from *re*, back again, anew + *suscitare*, to raise, from *sus*, s.d., up, under + *citare*, to call, rouse). The revival of the apparently dead. The apparently dead to whom efforts to restore are of use are those asphyxiated by drowning, by breathing illuminating gas, or by suffocation, and those suffering from syncope or the effects of electricity. In syncope, or fainting, the head and heart should be placed on a low level, while the lower extremities are elevated. If this manipulation is not rapidly successful, respiration may be excited by sprinkling the face suddenly with water and applying to the nostrils some pungent volatile substance such as spirits of camphor or weak ammonia. Victims of electric shock may sometimes be resuscitated by the use of artificial respiration by means of Gibbons's instrument. This consists of two bellows so arranged that one pumps air into the lungs through a nostril while the other exhausts the lungs of expired air. In the case of asphyxiation from inhaling either illuminating gas or carbonic dioxide, artificial respiration should be employed together with administration of oxygen through the nostril. Apparently drowned persons may often be resuscitated by syphoning the water out of the stomach and then using artificial respiration and keeping the body warm by means of artificial heat. See HALL, MARSHALL: RESPIRATION, ARTIFICIAL.

RESZKE, řesh'ke, EDOUARD DE (1856—). A Polish opera singer, brother of Jean de Reszke, born at Warsaw. After studying with his brother, he received instruction from Ciaffei, Steller, Coletti, and Sbriglia. Originally he had studied scientific farming in Silesia, and had devoted himself to the care of the family estates. It was at the suggestion of Jean, then in the first flush of his success, that he took up the study of music. He made his first public appearance in 1876 at the Italiens in Paris, as the King in Verdi's *Aida*, which was so successful that Massenet entrusted to him the creation of *Le roi de Lahore* at La Scala in Milan. From 1880 to 1884 he sang with the Royal Italian Opera Company in London, where he became famous as one of the greatest dramatic basses of his time.

RESZKE, JEAN DE (1853—). A Polish dramatic tenor, born at Warsaw. Through the influence of his father, a prominent State official, and his mother, who was possessed of remarkable musical talent, he saw much of the world's great artists, the family salon possessing an attraction for the most celebrated musicians of the day. When but twelve years of age, De Reszke was singing in the Cathedral, where the quality of his voice aroused the interest of the city. Afterwards he took up the profession of law, and obtained his degree and license. But the attraction of music proved too strong, and he began to study for the stage under Ciaffei and Cotogno. In 1874 he made his debut at Venice, as Alfonso in *La Favorita*, under the name of De Reschi. Soon afterwards he appeared in London in the same rôle, where the critics complained that his voice lacked the deep quality and resonance of a barytone. He attained considerable celebrity, however, but his physical strength began to suffer from the wear and tear

of singing parts too low for him, and acting upon the advice of Sbriglia, he retired from the stage, and prepared himself in a tenor repertoire. On the completion of two years of study he made his second debut before the public, in 1879, this time in the tenor rôle of *Robert le Diable*, at Madrid. His success was instantaneous, and his career a continuous artistic triumph. His repertoire includes *Faust*, *Lohengrin*, *L'Africain*, *Aida*, *Le Cid* (written for him by Massenet), *Les Huguenots*, *Elaine*, *Roméo and Juliet*, and *Tristan*. He is conceded to be one of the most artistic singers and actors known to the operatic stage. Since 1891 both De Reszkes have, with short interruptions, been favorite members of the Metropolitan Opera House Company in New York.

RETAINER (from Lat. *retinere*, to retain, hold back, from *re*, back again, anew + *tenere*, to hold). The employment of an attorney, counselor, or other legal practitioner, to prosecute or defend an action, or represent a person, in his professional capacity. It is not necessary that a retainer be in writing; a mere verbal request is sufficient. Upon being retained an attorney has full powers incidental to professional representation. The term is also applied to a fee paid to a legal practitioner for his services, usually in advance, and constituting only a part of his whole fee. See ATTORNEY; COUNSELOR.

The act of an executor, to whom the estate is in debt, in retaining in his hands a sufficient amount to satisfy his claim, is also technically known as retainer.

RETAINER. See LIVERY.

RETAINING WALLS. Walls built to retain earth or other incoherent substances in positions and forms which, without such artificial aid, they could not maintain. Most earths, if left to themselves, will not stand with vertical sides, but will fall or slide down until they assume a certain slope. The angle which this slope makes with the horizontal is called the 'angle of repose,' and it varies according to the nature of

DIAGRAM OF RETAINING WALL.

the material, the amount of water it contains, etc. The same earth will have different angles of repose under different conditions. In the accompanying figure, E represents a section of a mass of earth which it is desired to retain by the wall ABDC. If the line BG represent the angle of repose, then it is evident that the duty of the retaining wall is to keep in position the wedge-shaped mass of earth ABG. This mass tends to destroy the retaining wall, (1) by overturning it by rotation along the front edge D; (2) by the crushing of the stone along the front edge; and (3) by sliding the wall forward on its base, DB, or along some horizontal plane above the base. In designing a retaining wall the engineer seeks to fix its dimensions so that it is safe against destruction by any or all of these

destructive tendencies. The difficulty of doing this arises from the fact that the pressures exerted by the wedge-shaped mass of earth vary so greatly with the character and physical condition of the material that they can only be roughly approximated. Engineers have worked out numerous formulas for calculating the dimensions of retaining walls, which are designed to meet the varying conditions of the load, but these formulas have to be based on so many hypotheses that their practical value, except for general indications, is quite limited. The greatest difficulty arises from the action of water, which accumulates behind the wall and may transform the earth to a semi-fluid state, thus enormously increasing its pressure, and one of the chief desiderata in retaining-wall construction is that this water shall be kept drained away. This is usually accomplished by having drainage holes, commonly called 'weep holes,' through the wall at intervals, by means of which the water runs off as fast as it accumulates.

Retaining walls are generally made trapezoidal in section, as shown by the diagram, but they are also built with rectangular sections and with concave faces. Danger from crushing seldom exists except in very high walls, and danger from shifting can be easily avoided by laying the masonry with its courses dipping slightly from the front toward the rear. Careful workmanship and perfect drainage are the essentials of good retaining-wall construction.

BIBLIOGRAPHY. For a discussion of the theory of retaining-wall construction for various forms of walls and various conditions of loading, consult: Howe, *Retaining Walls for Earth* (New York, 1896); Merriman, *Retaining Walls and Masonry Dams* (New York, 1892); Cain, *Practical Designing of Retaining Walls* (New York, 1888); and Baker, *Treatise on Masonry Construction* (New York, 1900). See MASONRY.

RETALIATION (from Lat. *retaliare*, to retaliate, from *re*, back again, anew + *talis*, such). Properly, the return of like for like; usually, the infliction upon a wrong-doer of an evil similar to that which he has wrought. In early law, when wrongs are redressed by the act of the injured party or kinship group, such redress often takes the form of retaliation. The retaliatory idea sometimes assumes peculiar forms: as when the man whose father has been slain seeks to slay in return not the offender himself, but the offender's father. The clearest expression of the *lex talionis*, or law of retaliation, is found in the Jewish rules, "An eye for an eye and a tooth for a tooth," and "Whoso sheddeth man's blood, by man's hand shall his blood be shed." In the Roman XII Tables *talia* is authorized as a penalty for mayhem (*membrum ruptum*) if the injured party refuses to accept pecuniary compensation. Retaliation is sanctioned in the Visigothic laws, but this (according to Brunner, who asserts that there is practically no retaliatory element in old German law) was due to the influence of the Old Testament. A modern parallel was afforded in colonial Connecticut, where the penalty of castration was imposed in at least one instance on the authority of the Mosaic rule.

When public punishment begins to take the place of private vengeance, penalty may be, and often is, measured according to the degree of

wrath which the offense commonly arouses, but purely retaliatory penalties tend to disappear. To punish a perjurer by hewing off the hand which he has raised in swearing, or a slanderer by cutting off the tongue, is not properly retaliation. Such penalties may originate in a sort of personation of the offending member, or they may be based, as Brunner suggests, on the desire to make the relation of crime and punishment obvious: "the penalty itself is to declare why it is imposed." Retaliation may be based, in part, on this idea, but such symbolic penalties are not in themselves retaliatory. More closely akin to retaliation is the infliction upon a false accuser of the penalty which would have been inflicted on the accused if the charge had been sustained.

The term retaliation is sometimes loosely employed to describe the return of evil for evil even when there is no similarity between the offense and the punishment. In this broad sense, retaliation includes all extra-legal vengeance and all legal punishment. It is in this sense that we speak of 'the retaliatory theory' of punishment, meaning the theory which bases the right of the community to punish criminals on the fact that they have injured the community by their crimes.

RETBERG, rätberk, RAIF VON (1812-85). A German writer on art, born at Lisbon, where his father was then stationed as a captain in the German-English Legion. From 1829 to 1845 Retberg served as an officer in the Hanover Army, and then settled in Munich. His works are of especial value for the knowledge of art and culture at Nuremberg, and include: *Nürnbergers Briefe zur Geschichte der Kunst* (1846); *Nürnbergers Kunstleben in seinen Denkmälern* (1854); *Kulturgeschichtliche Briefe* (1865); *Albrecht Dürers Kupferstiche und Holzschnitte, kritisches Verzeichniss* (1871). Posthumously, *Die Geschichte der deutschen Wappbilder* (Vienna, 1888) was published from his manuscripts.

RETENTION (Lat. *retentio*, from *retinere*, to retain, hold back), or CONSERVATION. In psychology, the effect which is left upon the organism by psychophysical processes. One is said to retain one's experiences and to 'live them over' again and again. Retention is, therefore, the presupposition of memory. In Herbartian psychology (see HERRART) ideas are supposed to maintain their existence even after they have left consciousness. But most recent writers on psychology regard retention as a physical function. It is, they assert, the brain that 'retains.' This view is based partially on the observation of pathological cases, which reveals the fact that both general and specific disturbances of memory are connected with definite changes either in the cortex as a whole or in some limited area of it. (See APHASIA.) These pathological facts have told us something of the 'seat' of retention. Lesions in one region of the cortex affect retention of visual sensations and ideas; lesions in another region, that of auditory sensations and ideas. There is, however, still much doubt as to the extent of the differentiation of cerebral functions. Concerning the actual physiological changes which are left over from excitation there is also some difference of opinion. Most psychologists agree, however, that the activity which a stimulus produces ceases with the passing of the stimulation, but that some kind of modification remains.

Wundt maintains that the exercise of nervous elements leaves a tendency toward repetition of the same function whenever the same elements are reexcited.

The conditions under which retention takes place are both general and special. The general conditions are health, plasticity of the nervous system (retention is much easier in childhood and youth than in old age), mental disposition, attention, and the formation of associations. Among special conditions influencing retention stand emotion and mood; vividness, intensity, and duration of the impression; repetition and the concreteness or abstractness of the material composing the experience.

See MEMORY; MENTAL CONSTITUTION; REPRODUCTION OF IDEAS.

RETENTION OF URINE. A lack of power to evacuate the bladder. This may be either complete or partial. It should be carefully distinguished from *suppression*, in which there is a failure on the part of the kidneys to secrete urine, and consequently the bladder is empty. The causes of retention may be *organic* or *functional*. Among the chief organic causes are: (1) Urethral stricture, (2) injuries resulting in contraction or rupture of the urethra, (3) tumors within the urethra or pressing upon it from without, (4) foreign bodies in the urinary canal, such as small calculi, clotted blood, pieces of bougies, catheters, etc., (5) enlargement of the prostate gland, acute or chronic, especially in aged men, abscesses in the perineum, the pressure of a loaded rectum, the head of the child during labor, or pelvic tumors of any kind. The functional causes of retention are spasm of the urethra or the neck of the bladder, partial or complete paralysis of the bladder, and hysteria.

The symptoms of retention consist of an urgent desire to pass water, with partial or entire inability to accomplish the desire; restlessness, discomfort, and even violent pain accompany the straining efforts to evacuate the bladder. On percussion above the brim of the pelvis, the bladder is found to be distended in proportion to the amount of accumulated urine. If relief is not speedily afforded the bladder may give way and discharge its contents into the peritoneal cavity, in which case death soon follows; or the urethra behind the stricture may give way, and the urine be extravasated into the surrounding tissues, provoking severe inflammation and gangrene.

Treatment will depend in its details upon the cause-operative in each case. Only general principles can be given here. Spasmodic retention can nearly always be relieved by warm baths, heat to the perineum, purgation, sedatives, or in extreme cases by a few whiffs of chloroform. Attempts should be made to draw off the urine through a small catheter. If this measure fails, recourse must be had in a few hours to aspiration of the bladder, through a hollow needle thrust into it through the abdominal wall above the pubes. This measure, however, is rarely

necessary. Paralysis of the bladder may arise from the general weakness of old age, from a depressed state of the nervous system in fevers of the typhoid type, in spinal disease, apoplexy, etc. Retention from paralysis is often accompanied by a dribbling away of the urine, so that it may at first be mistaken for incontinence. In chronic prostatic cases the urine has to be regularly drawn off with the catheter.

RETHEL, rā'tél, ALFRED (1816-59). A German historical painter. He was born near Aix-la-Chapelle, May 15, 1816. His artistic training began at the age of thirteen under Schadow in the Düsseldorf Academy; but, dissatisfied, he repaired in 1836 to Frankfort to work under Philip Veit and Schwind. At Düsseldorf he had earned reputation with episodes from the life of Saint Boniface, one of which (1832) is in the National Gallery in Berlin, and in Frankfort he painted a "Xenecsis" (1837); a "Daniel in the Lions' Den" (1838, Städels Institute); "Guardian Angel of Emperor Maximilian" (fresco, ib.); "Resurrection" (Church of Saint Nicholas); the portraits of Emperors Maximilian I. and II., Charles V., and Philip of Suabia, for the Römer (1838); "Saints Peter and John Healing the Lame" (1840-41, Leipzig Museum); and "Finding of the Body of Gustavus Adolphus" (Stuttgart Museum). In the competition for a cycle of eight frescoes from the life of Charlemagne to adorn the city hall at Aix-la-Chapelle he carried off the first prize, and after a visit to Italy (1844-45), executed (1847-52) four of the subjects, to wit: "Otho III. in the Tomb of Charlemagne;" "Destruction of the Irminsul;" "Defeat of the Saracens at Cordova;" and "Conquest of Pavia in 774." The cartoons for these are in the National Gallery, Berlin, and the cycle was afterwards completed from Rethel's designs by Josef Kehren. This monumental work, imbued with the spirit of grandeur and simplicity, was the greatest achievement of historical painting in Germany during the first half of the nineteenth century. Attacked by a nervous disease, Rethel in vain sought relief in a second visit to Italy in 1852-53, and died insane at Düsseldorf, December 1, 1859. A series of six water colors depicting the "Expedition of Hannibal Crossing the Alps" (1844-45), and his illustrations to the "Dance of Death" (1848, with poetical text by Reimick, 13th ed. 1902), deserve special mention. His brother and pupil, OTTO (1822-92), who also studied under Karl Sohn and Schadow at the Düsseldorf Academy, painted at first Scriptural subjects, such as "Boaz Meeting Ruth" (1855, Leipzig Museum), and afterwards chiefly portraits and genre scenes. For Alfred Rethel's biography, consult: Müller von Königswinter (Leipzig, 1861); Valentin, in *Ästhetische Schriften*, i. (Berlin, 1892); *Art Journal* (London, 1865); and Pecht, *Deutsche Künstler*, ii. (Nördlingen, 1879).

RÉTIF DE LA BRETONNE, rā'tél' de la bre-tón', NICOLAS EDMÉ (1734-1806). A French novelist, nicknamed by Grimm the "Gutter-Rousseau," born in Sacy. The discovery of his love-letters to another woman than his wife in 1765 led to the first recognition of his literary talent. From the first his fiction was the work of observation and largely of personal experience. Its success was gradual, but steady. *Le pied de Fanchette* (1769) made him known, *Le paysan*

perverti (1775) made him famous and sought by distinguished men. Of his other writings the *Monsieur Nicolas* and the 42 volumes of *Les contemporains* (1780-85) are most noteworthy. The novels are declamatory and rhetorical, but they offer the first serious treatment of the petty bourgeois in fiction. A fair idea of his manner and merits may be obtained from Assezat's selection (3 vols., Paris, 1875).

RETIMO, rá'té-mó. A seaport town of the island of Crete, on the north coast, 38 miles west of Candia (Map; Greece, F 6). Population, in 1900, 9311.

RETINA. See EYE.

RETINITIS (Neo-Lat., from *retina*, so called because like fine network, from Lat. *rete*, net). Inflammations of the retina are primary or secondary to inflammation of other parts of the eye. Both eyes are usually affected. Sight is impaired, the size or form of objects seems altered, the field of vision is contracted; there is a feeling of discomfort in the eyes and at times dread of light. The ophthalmoscope shows a fundus hazy from swelling, tortuous, and dilated veins, a disk with indistinct margins, sometimes hemorrhages. Recovery may be complete or partial. Atrophy of the retina and the optic disk may result in loss of sight partially or completely. Treatment includes absolute rest of the eyes with protection from light, use of atropine locally, and constitutional treatment of the cause of the retinitis. This depends upon the variety. *Simple retinitis* may result from overuse of the eyes in any way or may be the beginning of other forms. *Albuminuric retinitis*, which occurs during nephritis, is characterized by the presence in the retina, in addition to hemorrhages, of white spots. At the macula lutea these are often arranged in a star-like form. Treatment is that of the kidney disease. *Diabetic retinitis* presents a picture similar to the preceding form, but with the white spots arranged irregularly around the macula, and the treatment is directed to the cause. *Syphilitic retinitis* occurs in the hereditary form and in the secondary stage of acquired syphilis. The fundus is hazy, the disk red and hazy; there are scattered grayish and white spots, often with pigmented borders, especially near the macula, and white marks along the vessels. The course is slow, relapses frequent, and though early and thorough treatment of the constitutional disease gives good results, there is likely to be some permanent diminution of vision. *Hemorrhagic retinitis*, as its name indicates, is characterized by the occurrence of numerous hemorrhages. It occurs in persons with diseases of the arteries and heart, and frequently precedes cerebral hemorrhage. Treatment of the arterial disease is very important. *Leukemic retinitis* causes pallor of the disk with white and yellow spots, sometimes with a pink border, and hemorrhage areas.

RETINOSPORA. A tree. See CYPRESS.

RETIREMENT (from *retire*, from OF., Fr. *retirer*, to draw back, from *re*, back + *tirer*, to draw, from ML. *tirare*, to draw). A statutory provision or age limit by which officers in the military or naval services cease from active duties, and are placed on the retired list. In the United States Army the compulsory age

limit is sixty-four, but the President may retire an officer at sixty-two. In the United States Navy the retiring age is sixty-two years. Army regulations provide that when an officer becomes disabled or unfit for the performance of duty by reason of wounds, sickness, or improper habits, a retiring board will convene and action be taken according to the verdict. Officers on the retired list are permitted to wear the uniform of their actual or highest brevet rank when retired, except that the number or insignia of the regiment, corps, or department will not be worn. Retired officers receive 75 per cent. of pay (salary and increase) of their rank. A limited number may be assigned at their request to duty with full pay to militia or schools as instructors, or in time of war to other duty. In the British Army officers are permitted to retire voluntarily with gratuities or pensions, and are also obliged to retire according to age limit (which varies according to rank held), or after a period of non-employment, on half pay. Regulations similar in effect obtain in all countries.

RETORSION (ML. *retorsio*, *retortio*, a bending or twisting back, from Lat. *retorquere*, to bend or twist back, from *re*, back again, anew + *torquere*, to twist). A term of international law signifying an act of retaliation by one nation against another. Unlike reprisal (q.v.), it is not a sufficient justification for war, but is rather a political measure intended to compel one nation to accord equality of treatment to the subjects of the other residing within its jurisdiction. Thus, where one nation imposes restrictions upon aliens residing within its territory, as by unequal taxes, or by differential import duties, or fails to observe the rules of international comity, as by refusing to grant the accustomed privileges to ambassadors and other diplomatic agents, the aggrieved nation is justified in applying the same kind of treatment to the offending nation or its subjects. The increasing commercial relations of modern States have greatly extended the field in which the principle of retorsion may be applied, and it is now most frequently resorted to by those nations which depend largely upon tariffs or import duties for their revenue.

RETREAT (OF. *retréte*, *retraité*, Fr. *retraite*, from ML. *retracta*, retreat, from Lat. *retrahere*, to draw back, from *re*, back again, anew + *trahere*, to draw). In military tactics and strategy, a retirement before, or in the face of, an enemy. It is one of the most difficult as well as important manœuvres of modern warfare. The most important feature of the retreat, and the one on which rests its ultimate success, is the rear guard (q.v.). In barracks, army post, or camp life and routine in the United States Army, the bugle call 'retreat' signifies sunset, and is played by the field music (See BUGH AND TAP METAL CALLS.) There is usually a parade or roll call at that hour known as the evening parade, at which time extra duty details, guards or pickets, are paraded and go on duty. The ceremony of the retreat is observed throughout the armies of the world and is usually accompanied by gun fire and the lowering of the national color, which is hoisted again at reveille (q.v.).

RETREAT. A term used in the Roman Catholic and Anglican churches to designate a time of temporary retirement from active life

for the sake of prayer, meditation, and spiritual exercises. The practice is very ancient in the church, as a following of the practice of Christ in 40. The stricter retreats, especially those which the clergy of most Roman Catholic dioceses make every year, involve the giving up of the whole time to spiritual exercises, and usually silence is observed during them; but in the case of those who cannot leave their employment, services in the early morning and evening are provided; in their case the order of observances does not materially differ from that of a mission (q.v.).

RETRENCHMENT (from *retrench*, from OF. *retrencher*, *retrencher*, Fr. *retrencher*, to cut off, from *re-*, back — *trancher*, to cut, from Lat. *truncare*, to lop, from *truncus*, maimed). A defensive work in military fortification. It closely resembles the redoubt (q.v.) in construction and is usually built across the gorge of a redan or bastion, or from shoulder to shoulder, when it is apprehended that the salient angle may fall into the hands of the enemy. See FORTIFICATION: REDAN; REDOUBT.

RETRIEVER. A dog used in hunting aquatic birds. See FIELD DOG.

RETROACTIVE (from Lat. *retroactus*, p.p. of *retroagere*, to turn back, from *retro-*, back + *agere*, to do, act, drive) or **RETROSPECTIVE LAWS.** These terms are used interchangeably to denote statutes which apply to a state of facts which existed before their enactment. Retroactive laws that are of a criminal or penal nature are specifically known as *ex-post-facto* laws, and are expressly forbidden by the United States Constitution. The Constitution also prohibits laws impairing the obligations of contracts. With these exceptions Congress, or the legislatures of the various States, are free to enact retrospective statutes whenever they may deem it advisable to do so. Although retroactive laws are in disfavor where they have the above effect, there are many which are necessary to remedy defects in the law theretofore existing. For example, statutes making valid deeds of married women executed within a certain time prior to their passage, or conveyances which did not bear a certain stamp required by law at the time of their execution, may have a most salutary effect. See EX-POST-FACTO LAWS; LAW; STATUTE; INTERPRETATION.

RETROGRADE (OF. *retrograde*, Fr. *retrograde*, from Lat. *retrogradi*, to go backward, from *retro-*, back + *gradi*, to walk). A term applied to the motion of the planets among the fixed stars when they appear to move in the *reverse* order of the signs of the zodiac (q.v.). All the planets move in the same direction round the sun, and therefore apparent retrograde motions must be due to their motion *relative* to the earth. In the case of comets, however, we have instances of motion about the sun in the opposite direction to that of the planets, and in such orbits the motion (referred now to the sun, not to the earth) is said to be retrograde. In the case of the planets, let S be the sun, and let the two circles represent the orbits of two planets. First, let the planets be, at P and Q, toward the same side of the sun. The planet nearer the sun has of course the greater velocity, and therefore, if *p* and *q* repre-

sent their positions after the lapse of a given time, Pp is greater than Qq, and therefore the *direction* of the line *pq* (in which one is seen from the other) has rotated in the *opposite* direction to that in which either planet revolves about the sun. Hence, when a superior planet is in opposition (i.e. if Q be Jupiter, and P the earth), it *appears* to move backward among the stars. When an inferior planet is between the earth and

sun (i.e. if Q be the earth, and P Venus), it *appears* to move backward also. If the planets be on opposite sides of the sun, as at P and R in the figure, let *p* and *r* be their positions after a given time; then *pr* has turned from the direction PR in the direction in which the planets revolve about the sun. Hence any planet, superior or inferior, appears to move *directly* when the sun is between it and the earth. Between these two opposite cases, there must, of course, be points at which the apparent motion is neither retrograde nor direct—then the planet is said to be *stationary*. This case occurs whenever, for an instant, the lines PQ and *pq* are parallel; that is, when the two planets are moving with equal velocities transverse to the line joining them, these velocities being parallel, and toward the same side of the joining line.

RETURNING BOARDS. In the United States, official bodies designated by law for canvassing the results of popular elections. The general rule is that a returning board in canvassing the returns sent to it acts in a ministerial capacity and must leave the correction of error or fraud to the courts unless the return be void on its face, in which case, of course, the returning board must reject it. The board for canvassing the returns of State elections usually consists of certain designated State officers including the Secretary of State and the Attorney-General. In some States the returns are canvassed by the presiding officers of the Legislature in the presence of the two Houses. In the case of members of the Legislature the returns are usually sent to the Secretary of State, though sometimes to a returning board, but all contests are decided by the Houses themselves in pursuance of a constitutional privilege everywhere allowed. In the case of local officers contested returns are settled by the courts acting as a canvassing authority, or in a *quo warranto* proceeding. In the case of Presidential electors Congress provided by the Act of 1887 that disputed returns in any State might be settled by such organs and according to such procedure as State law might provide. If this be not done within six days of the meeting of the electors, the two Houses of Congress have the final determination of the election.

RETZ, rôtz, GILLES DE LAVAL, Seigneur de. See BLUEBEARD.

RETZ, rôtz, JEAN FRANÇOIS PAUL DE GONDI, Cardinal de (1614-79). A French politician and author, born at Montmirail. His early education was intrusted to Saint Vincent de Paul, and he

later attended the Jesuit College at Clermont. It is said that he was compelled by his family to enter the Church in the expectation that he would become Archbishop of Paris, a position which had been held by two members of his house. He was brilliant in his studies, but dissolute in private life. He engaged in political intrigues with the Count of Poissons, but after the death of that nobleman resumed his theological studies and was made coadjutor of the Archbishop of Paris in 1643 by Louis XIII. He devoted himself to his duties with zeal and won popularity by his profuse distribution of alms. At the time of the Fronde (q.v.) he was at first of great assistance to the royal cause, but soon aroused the distrust of the Court, and became the leader of the popular party, displaying consummate talents for intrigue. In 1651 he became reconciled with the Queen mother, Anne of Austria, and with her aid he succeeded in obtaining a cardinal's hat. After the return of the Court to Paris, in 1652, a mission to Rome was offered to Gondi which he seemed disinclined to accept. Mazarin was determined that his rival should be silenced, however, and managed to have Cardinal de Retz arrested and imprisoned at Vincennes. The Cardinal thereupon resigned the Archbishopric of Paris, which had come to him by the death of his uncle, and was allowed to retire to Nantes, whence he made his escape to Spain (1654) and repaired to Rome. There, in spite of his previous renunciation, he again claimed the Archbishopric of Paris, and in 1662 he succeeded in bartering the Archbishopric for profitable benefices. At the same time he became reconciled to Louis XIV., and returned to France, but abstained from further political intrigue. He sold his estates, paid his heavy debts, and devoted his life to charity and religion. His *Œuvres*, which cover the years 1643-55, are described by Voltaire as displaying the grandeur, impetuosity, and inequality of genius. They are not, however, trustworthy, on account of political bias. The best edition of his works is that by Feillet in the *Collection des grands écrivains de la France* (Paris, 1870-96). Consult: Chantelauze, *Le cardinal de Retz, étude historique* (Paris, 1878); id., *Le cardinal de Retz et ses missions diplomatiques à Rome* (ib., 1879).

RETZIUS, MAGNUS GUSTAV (1842—). A Swedish histologist, born in Stockholm. He was for some time professor of histology and anatomy in the Caroline Institute. His printed works on anthropology include: *Finska Kraulier* ("Finnish Skulls," 1872); *Biologische Untersuchungen* (1880-81); and *Gehirnorgane der Wirbelthiere* (1881-84). With Prof. Axel Key he published *Studien in der Anatomie des Nervensystems und des Bindegewebes* (1875). In 1890 he became editor of the *Biologische Untersuchungen*.

RETZSCH, rëch, MORITZ (1779-1857). A German painter and engraver. He was born in Dresden, December 9, 1779, and studied at the academy of his native city, where he became a professor in 1824, and died July 11, 1857. Although treating romantic subjects, he belongs to the followers of Mengs. His chief celebrity rests upon his illustrations in outline of the great German poets, Schiller, Goethe, etc., whom he interpreted with great vigor and sympathy. His etchings of Goethe's *Faust* (26 plates, 1884)

are particularly well known, not only in his own country, but also in France and England. Among other important works are the outline illustrations of Schiller's *Leid von der Glocke* (43 plates, 1884); his *Shakespeare Gallery* (80 plates, 1860); and his outline drawings of Bürger's *Ballads* (15 plates, 1872). His oil paintings, treating classical subjects, are of little interest, but he succeeded better with portraits.

REUCHLIN, rëuklën, JOHANN, known also by the Greek form of his name, ΚΑΡΝΟ (1455-1522). The first humanist of Germany and one of the earliest promoters of Hebrew studies in that country. He was born at Pforzheim, in Baden, February 22, 1455. He began his studies at his native place, continued them at Freiburg, and in 1473 accompanied Prince Frederick of Baden to Paris, where he made the acquaintance of Johann Wessel (q.v.) and began to study Greek. The next year he went to Basel, where he took his bachelor's degree in 1475 and his master's in 1477. He then revisited France, studied law at Orleans and Poitiers, and gave lectures in Greek and Latin. In 1481 he established himself at Tübingen as teacher of jurisprudence and literature. He entered the service of Eberhard, first Duke of Württemberg, accompanied him to Italy in 1482, and was employed in a number of public services. He visited Italy again in 1490. In 1492 the Emperor made him a count of the German Empire, and about the same time he began the study of Hebrew under a learned Jew who was Imperial physician. In 1496, after Eberhard's death, he went to Heidelberg, and made a third visit to Italy in the service of the Elector Palatine in 1498. At Rome he applied himself with renewed vigor to the study of Hebrew and Greek. He returned to Württemberg in 1499, and in 1502 was made a member of the Swabian confederate tribunal, retaining the office till 1513. In consequence of a quarrel between Ulrich, Duke of Württemberg, and the Swabian League, he went to Ingolstadt in 1519 and taught Greek and Hebrew at the university. When the plague broke out at Ingolstadt two years later he returned to Tübingen, intending to devote himself exclusively to study, but soon fell sick, and died at Liebenzell, June 30, 1522. Reuchlin is justly regarded as the father of Greek and Hebrew studies in Germany. He had great ability as a teacher, and, although for most of his life he held no professorial chair and was not always free to lecture openly, nevertheless he directed and encouraged the study of both languages in his generation. His devotion to Hebrew was the cause of the most interesting and important incident of his life. In 1510 one Johann Pfefferkorn, a baptized Jew, called upon princes and subjects to prosecute the religion of his fathers, and especially urged the Emperor to burn or confiscate all Jewish books except the Bible. Reuchlin remonstrated, maintaining that only books directly written against Christianity should be destroyed. This attitude drew upon him the enmity of the Dominicans, and particularly of the Inquisitor Jakob van Hoogstraten (q.v.). Reuchlin's opponents controlled the universities of Paris, Louvain, Erfurt, and Mainz; but many of the distinguished and independent thinkers of Germany were on the side of the scholar. Ulrich von Hutten and Franz von Sickingen in particular gave him support and pro-

tection, the latter threatening Hoogstraten and the monks with terrible vengeance if they did not cease to persecute "his teacher, Doctor Reuchlin, that wise, experienced, pious, and ingenious man." The *Epistola Obscurorum Virorum* (qv.) was an outcome of the contest. While there was much in Reuchlin's character and experience to draw him toward the Reformation, he never openly joined the movement, and late in life declared against Luther. Melancthon was his great-nephew. Reuchlin's works include editions and Latin translations of Greek texts: a *Vocabularius Latinus Grecilocus* (1475); a manuscript Greek grammar (not published); the *Radionota Linguae Hebraicae* (1506), which, with pardonable pride, he declares to be "the first attempt to execute a grammar of the Hebrew tongue," and made "without any foreign help;" *De Accentibus et Orthographi Hebraeorum Libri III.* (1518); an edition of the seven Penitential Psalms (1512), the first Hebrew book printed in Germany; *De Verbo Mirifico* (1494); and *De Arte Cabalistica* (1517), works on the Cabala; *Seculae Prognosticata* (1497), and *Serpius* (1507), Latin satirical comedies, not without humor and literary merit; the *Jugenspiegel* (1511); ed. by Mayerhoff, Berlin, 1836), a reply to a book by Pfefferkorn (the *Handspiegel*). Two of Reuchlin's Greek treatises, the *De Quatuor Idiomatibus* and *Colloquia graeca*, have been published by Horawitz under the title *Griechische Studien* (Berlin, 1884). The best biography of Reuchlin is Geiger, *Johann Reuchlin; sein Leben und seine Werke* (Leipzig, 1871); consult also: id., *Johann Reuchlins Briefwechsel* (Tübingen, 1875); Horawitz, *Zur Biographie und Korrespondenz J. Reuchlins* (Vienna, 1877); Holstein, *J. Reuchlins Komödien* (Halle, 1888); Strauss, *Ulrich von Hutten* (6th ed., Leipzig, 1895), for the controversy about the Jewish books.

REULEAUX, rē'wō', FRANZ (1829—), A German mechanical engineer, born at Eschweiler, near Aix-la-Chapelle, where his father had machine shops. After finishing his apprenticeship in Koblentz, he worked in his father's shops, studied at Karlsruhe, and for a year was head of a factory in Cologne. Then he taught in Zurich (1856-64) and in Berlin (1864-96), where from 1868 until retirement he was director of the Industrial School. Reuleaux was intimately connected with German machinery exhibits at Philadelphia in 1876 and at Sydney and Melbourne (1879-81). His *Briefe aus Philadelphia* (1877) voice a sharp criticism on German methods of construction and especially on the lack of artistic design. To remedy this fault Reuleaux gathered a great collection of kinematic models in Berlin. His works are: *Konstruktionslehre* (with Moll, 1854-62); *Der Konstrukteur* (1860-62, and often); *Kurzgefasste Geschichte der Dampfmaschine* (1891); and *Thomassche Rechenmaschine* (2d ed., 1892).

REUMONT, rē'mōn', ALFRED VON (1808-87), A German historian. He was born at Aix-la-Chapelle, studied at Bonn and Heidelberg, and in 1832 traveled through Greece and the Ionian Islands. In 1835 he entered the diplomatic service, and subsequently was Minister Resident in Italy, principally at the Papal Court. His historical works include: *Gangneelli, seine Briefe und seine Zeit* (1847); *Beiträge zur italienischen*

Geschichte (1853-57); *Die Jugend Katharinas de' Medici* (1854); *Die Gräfin von Albany* (1860); *Zeitgenossen* (1862); *Geschichte der Stadt Rom* (1867-70); *Lorenzo de' Medici il Magnifico* (1874); *Geschichte Toscanas* (1876-77); *Vittoria Colonna* (1881); and *Charakterbilder aus der neuen Geschichte Italiens* (1886). Upon art he wrote biographies of Michelangelo (1834), Andrea del Sarto (1835), and Benvenuto Cellini (1847), and other works.

REUNION, CHAMBERS OF. See LOUIS XIV.

RÉUNION, rā'ōnyōn', ILE DE LA, formerly called ILE DE BOURBON. An island in the Indian Ocean belonging to France, and situated 400 miles east of Madagascar and 100 miles southwest of Mauritius, in latitude 21° S., longitude 55° 36' E. (Map: Africa, K 7). It is of nearly regular oval shape, 34 miles long by 22 miles broad, and has an area of 775 square miles. It is entirely of volcanic origin, and very mountainous, with numerous extinct craters, the highest peak being the Piton des Neiges, with an altitude of 10,069 feet. In the region known as the Pays Brûlé rises the only active volcano, the Piton de la Fournaise, 8713 feet above the sea. The plateau composing the island is fissured on all sides by deep cañons through which numerous mountain torrents run to the sea. The climate is generally pleasant and healthful, but the island is occasionally visited by devastating hurricanes. The flora and fauna resemble those of Madagascar. There are luxuriant tropical forests.

Over one-third of the total area is under cultivation. The principal products are sugar, vanilla, coffee, cacao, and spices. The imports and exports in 1900 amounted to \$4,250,825 and \$3,367,850 respectively. About 60 per cent. of the exports consists of sugar, and about 90 per cent. of the total commerce is with France and the French colonies.

The administration of the colony is in the hands of a Governor, who is assisted by a privy council and an elective council-general. The island is represented by one Senator and two Deputies in the French Parliament, and its towns are administered under the municipal code of France. The local budget for 1901 balanced at about \$900,000, and the subvention from France amounted to over one-half of the revenue. The population in 1897 was 173,192, including over 15,200 Indian coolies, 4500 natives of Madagascar, about 9000 Africans, and nearly 1000 Chinese. The white population is far from pure. The capital is Saint-Denis.

The discovery of the island at the beginning of the sixteenth century is usually assigned to the Portuguese navigator Mascarenhas, after whom it was named originally. It was acquired by France in 1649. From 1810 to 1815 the island was held by Great Britain. Consult: *Annuaire de l'île de la Réunion* (Saint Denis, annually); Oliver, *Crags and Craters: Rambles in the Island of Réunion* (London, 1896); Garsault, *Notice sur la Réunion* (Paris, 1900); Hermann, *Colonisation de l'île Bourbon et fondation du quartier Saint-Pierre* (ib., 1901).

RÉUS, rā'ūs. A town of Catalonia, Spain, in the Province of Tarragona, five miles northwest of the town of Tarragona (Map: Spain, F 2). The principal buildings are the Gothic Church of San Pedro, rebuilt in 1512-69,

with a high octagonal tower, and the handsome modern Fortuny Theatre. There are also a large hospital, several colleges, and an academy of fine arts. Cotton-spinning, which was introduced by English manufacturers in the latter part of the eighteenth century, and silk-spinning are the principal industries. The exports are wines, fruit, grain, and confectionery. Population, in 1887, 28,780; in 1900, 26,220.

REUSCH, roish, FRIEDRICH (1843—). A German sculptor, born at Siegen. He studied in Berlin at the Academy and under Albert Wolff, whom he assisted on the equestrian monument to Frederick William III. After his return to Berlin from a visit to Italy in 1874, he fashioned the marble group of "Market-Trade" (1879) for the Belle-Alliance Bridge, and the "Gemins of Steam" for the Technical Academy at Charlottenburg. In Königsberg, where he was appointed professor at the academy in 1881, he executed the large group of "Strength, Justice, and Moderation" for the Government building, the statues of "Albert, First Duke of Prussia" (1891), and of Emperor William I. (1894), both outside the royal palace, besides several other memorials, many busts and decorative figures for public buildings. At Siegen are a "Soldiers' Monument" (1877), the equestrian statue of "William I." (1892), and a bronze statue of "Bismarck" (1900), and there are also several charming mythological genre groups to his credit.

REUSS, rois. Two sovereign principalities of Germany, situated between the Prussian Province of Saxony, the Kingdom of Saxony, Bavaria, and some of the Saxon duchies, and separated from each other by the outlying district of Neustadt of the Grand Duchy of Saxe-Weimar (Map: Germany, D 3). They are: Reuss Elder Line, or Reuss-Greiz, and Reuss Younger Line, or Reuss-Schleiz. Reuss-Greiz covers an area of 122 square miles and is largely mountainous. Its principal products are woollens and knit goods. The Constitution of 1867 provides for a legislative assembly of 12 members, of whom three are nominated by the Prince, two by the nobility, three elected by the towns, and four by the rural districts. The capital is Greiz. The principality is represented by one member in the Bundes-rat and sends one deputy to the Reichstag. Population, in 1900, 68,287, almost entirely Protestants.

Reuss-Schleiz consists of a number of detached parcels of territory with a total area of 319 square miles. It is a mountainous country with deposits of marble and salt. The chief manufactures are woolen and cotton goods, machinery, musical instruments, and leather. The legislative body consists of 16 members, of whom three are elected by those paying the highest taxes, and 12 by the rest of the qualified voters, the head of the House of Reuss-Köstritz being an hereditary member. The executive and in part the legislative powers are vested in the Prince, who is assisted by a cabinet of three members. The principality sends one member to the Bundes-rat and one deputy to the Reichstag. The population in 1900 was 138,993, almost entirely Protestant. The capital is Gera. Consult: Manke, *Reichskunde des Fürstentums Reuss* (Halle, 1877); Gaul, *Beiträge zur Landeskunde des Fürstentums Reuss* (Greiz, 1900).

REUSS, EDUARD WILHELM ERGEN (1804-91). An Alsatian Protestant theologian. He was born at Strassburg, July 18, 1804, was educated at the seminary of his native town, studied theology and Oriental philology at Göttingen, Halle, and Paris, and took orders in the French Protestant Church. He returned to Strassburg as privat-docent, was made professor extraordinary at the university in 1834, and held different positions there till 1888. He died April 15, 1891. His principal works are: *Die Geschichte der heiligen Schriften des Neuen Testaments* (1842; 6th ed. 1887; Eng. trans. 1884); *Histoire de la théologie chrétienne au siècle apostolique* (1852; 3d ed. 1864; Eng. trans. 1872-74); *Histoire du canon des Saintes Ecritures* (1862; Eng. trans. 1884); *Die Geschichte der heiligen Schriften des Alten Testaments* (1881; 2d ed. 1890). He was one of the editors of the great edition of Calvin's works (59 vols., 1869-1900), and published a complete French translation of the Bible with commentaries (19 vols., 1875-81). Consult the memorial address by Lobstein (Strassburg, 1891).

REUSS, ROMULPH. (1841—). An Alsatian historian, born in Strassburg and educated there, at Jena, at Berlin, and at Göttingen. He became professor at the gymnasium of Strassburg in 1865, and after the Franco-Prussian War resumed this position, retiring from the Protestant seminary. From 1872 to 1896 Reuss was librarian of the Strassburg library. In 1896 he was appointed professor at the Ecole des Hautes Etudes in Paris. His historical writings in both French and German deal with Alsace; among them are: *Revue zur Geschichte des dreissigjährigen Krieges im Elsass* (1868); *Quatre noms et deux nouvelles de Strasbourg* (1883); and the important *Alsace au XIIIème siècle* (1897 et seq.).

REUTER, roiför, CHRISTIAN (1665-1712). A German author, born at Kütten, near Halle. He was a witty and gifted writer, and was especially effective in character delineation. In his *L'honnête femme; oder die christliche Frau zu Lipsitz* (1695) he skillfully uses Molière's fable in *Les picarreses ridicules*. His chief work is the novel *Schelmuffskys Reisebeschreibung* (1696), which was reedited by Schullern in 1885, and his other writings include *Der christlichen Frau Schlampanne Krankheit und Tod* (1696) and *Letztes Dank- und Ehrenmahl der Frau Schlampanne* (1697), which were republished in 1890.

REUTER, ERNZ (1810-74). A German humorist, who wrote in Low German (Plattdeutsch). He was born at Stavenhagen, in Mecklenburg-Schwerin, and was educated there and at Rostock and Jena, where he was arrested for political agitation (1833), and condemned to death, a sentence commuted to thirty years' imprisonment. He was confined in various fortresses till 1840, when he resumed legal studies at Heidelberg, afterwards managing his father's estate till 1850, when he became a private tutor at Treptow in Pomerania. Here he first began to write Low German sketches in prose and verse, the first volumes of which, *Lauschen am Rindels* (1853), showed such charming blending of humor and pathos in anecdotes and genre pictures as to achieve an immediate success, which was confirmed by the reception of *Pöttekabandendichte* (1855) and *De Reis' nah Bölligen* (1855). In 1856 Reuter moved to Neubrandenburg and gave

himself wholly to writing. The best of his many volumes are *8 kora Haru* (1861) and *Olle Kavaljerer* (1860-66). This latter contains the very autobiographical *Utnio Festungstid* and *Utnio Sverigstid* (his greatest work), and the famous picture of Germany in 1813, *Ud de Franke* (1813), with other work of less value. In 1863 Reuter moved to Eisenach, where he died, July 12, 1874. Reuter is one of the most realistic of the greater German writers. It is the realism of the Dutch genre painters, minute, good humored, bourgeois, as artistic in pathetic as in comic scenes. Reuter's works are in 13 volumes (Weimar, 1863-68), with two volumes of *Remains and Biography* (ib., 1875), and a comedy, *Die Drei Lounhouse* (1878). Consult: Glagau, *Fritz Reuter und seine Dichtungen* (2d ed., Berlin, 1875); Ebert, *Fritz Reuter, sein Leben und seine Werke* (Güstrow, 1874); Romer, *Fritz Reuter in seinem Leben und Schaffen* (Berlin, 1895).

REUTER, HERMANN FERDINAND (1817-89). A German theologian, born at Hildesheim. He studied in Berlin and Göttingen; in 1843 became lecturer in the University of Berlin; from 1853 to 1876 was successively professor at Breslau, Greifswald, and again at Breslau; and in 1876 was called to Göttingen. His writings in Church history show thorough and scholarly research, and his criticisms are well grounded and clearly expressed. His publications include *Geschichte Alexanders III. und der Kirche seiner Zeit* (1845-64) and *Geschichte der religiösen Aufklärung im Mittelalter* (1875-77). He founded the *Zeitschrift für Kirchengeschichte*, in which he published his *Augustinische Studien* (1876).

REUTER, PAUL JULIUS, Baron (1821-99). A pioneer in the business of news-gathering, born at Cassel, Germany. He was connected with the electric telegraph system from its earliest establishment in Europe, and was the first to organize a central bureau for the systematic collection and dissemination of telegraphic news. This office was opened at Aix-la-Chapelle in 1849. In 1851 he transferred his office to London. Reuter established agencies in all parts of the world to supply him with news; and, by using all available means of communication, and serving all papers impartially, he built up a noteworthy news service. In 1865 he transferred his business to a limited liability company, of which he was manager until 1878. In the same year he obtained from the Hanoverian Government a concession for the construction of a cable line between England and Germany. The title of baron was conferred upon him by the Duke of Saxe-Coburg-Gotha in 1872.

REUTLINGEN, reüt'ling-en. A town in the Kingdom of Württemberg, Germany, on the Echatz, at the foot of the Swabian Alps, 20 miles south of Stuttgart (Map: Germany, C 4). The thirteenth-century Gothic church, partly rebuilt in 1811, is now undergoing a thorough restoration. There are a gymnasium, a weaving school, a school of women's work, and a pomological institute. The town is an important centre of the yarn, woollen, cotton, and cloth industry. In 1240 Reutlingen became a free Imperial city. Subsequently it was a member of the Swabian League, and was annexed to Württemberg in 1803. Population, in 1890, 18,542; in 1900, 21,481.

RÉVAI, rá'vai, NICHOLAS (1750-1807). An Hungarian poet and philologist, born at Szent Miklós (Tortófal). He entered the Piarist Order when he was seventeen, taught drawing, philosophy, poetics, and rhetoric in the schools of the Order, and in 1802, after several years devoted entirely to literature, was appointed professor of Hungarian philology in the University of Pesth. He had begun to write poetry even before joining the Piarists, and in 1778 and 1787 published volumes of elegies, and versions from the Latin elegiacs, the Alexandrine poets, the Anaerontics, and a part of the *Iliad*. But his chief title to remembrance lies in his work in the realm of comparative grammar, his discovery that Lapp, Finnish, Estonian, and Ostiak are nearly akin to Hungarian, and his researches in Magyar etymology, as contained in *Antiquitates Litteraturæ Hungaricæ* (1803) and *Grammatica Hungarica* (1803-06).

REVAL, ré'val (Russ. *Réval*). An important Baltic seaport of Russia, and capital of the Government of Esthonia, situated on the Bay of Reval, an inlet of the Gulf of Finland, about 230 miles west-southwest of Saint Petersburg (Map: Russia, B 3). The town consists of two parts, the upper town or Donberg (Cathedral Hill), with the old castle, the administration buildings, and the residences of the aristocracy, and the lower town, mediæval in appearance and containing the old town hall, the House of the Schwarzhäupter (an association of merchants), dating from the time when the town was a member of the Hansa, and a guild house with a museum of Baltic antiquities. The educational institutions include three gymnasia, a Realschule, and a technical railway school.

The manufactures are machinery and beer. The harbor of Reval is one of the most spacious in Russia and freezes but seldom. The annual value of the commerce is over \$30,000,000, giving Reval the third rank among the Baltic ports of Russia. The principal exports are spirits, grain, flax, and animals; the chief imports, cotton, coal, and petroleum. Reval is the seat of an admiralty and of the administration of the Baltic light-houses. The sea baths in the vicinity are well patronized. Population, in 1897, 64,600, about one-half Esthonian, and over one-fourth German. The foundation of Reval is ascribed to the Danish King Waldemar II., who built there a castle in 1219. The town joined the Hansatic League in 1285 and soon attained considerable commercial importance. In 1346 it passed from the overlordship of the Dames to that of the Teutonic Knights. Sweden acquired it in 1561, and Peter the Great annexed it to Russia in 1710. Consult: Anelung, *Revaler Altertümer* (Reval, 1884); Rottbeck and Neumann, *Geschichte und Kunstdenkmäler der Stadt Reval* (Reval, 1896).

RÊVE, ráv, le (Fr., The Dream). One of the Rougon-Macquart series of novels by Emile Zola (1888). The story is in strong contrast with others of the series, the life of cathedral establishments forming the background of an idyllic tale of mysticism and human love.

REVEILLE, re-vá'yá, or (more usually in United States military service) *rêv'á-lev'* (OF. *revail*, Fr. *réveil*, awakening, from OF. *resveiller*, to awake again, from *re-*, again + *escveiller*, to awake, from Lat. *ex*, out + *vigilare*, to awake, from *vigil*, wakeful, from *vigere*, to be lively;

ultimately connected with Eng. *wake*). A military trumpet, bugle, or drum call sounded at break of day, or such time afterwards as may be ordered, to rouse the men from sleep. Officially, it is the commencement of the day's routine. The military day is from reveille to retreat (q.v.); and the night from retreat to reveille. See BUGLE AND TRUMPET CALLS.

REVELATION (Lat. *revelatio*, from *revelare*, to reveal, unveil, from *re*, back again, anew + *velare*, to veil, from *velum*, veil, cloth, sail, from *velere*, to carry along). In theology, a term used in both a general and a specific sense. In its broadest signification it expresses the unveiling or manifestation of the Divine to the human. In the narrower sense it is applied to one form of this manifestation, viz. the written word of God.

Using the term in the first or general sense, God manifests Himself in nature, in history, in the moral government of the world, in reason, and in the old ethnic religions and certain of the pagan philosophers. It seems impossible to believe in man and in a personal God without believing in a Revelation. The aspirations of the soul demand it. Man himself, as reflecting the Divine image, warrants it. Nature is the speaking and acting of God. It is Divine language in cipher. The universe is a manifestation of God's glory, a disclosure of His power. Specific revelation does not contradict these indications of Divine truth in nature. It gives them articulate expression. *History* and *revelation* are inseparable. The march of events and the development of ideas are but parts of a moving panorama of Divine creation and guidance. History is a chapter in the book of man's evolution. Behind the veil of external contingency there are the moral order of the life of nations, the rise and fall of dynasties, the progressive history of the human race, the development of man's religious consciousness in thought and in civilization. *Reason* and *revelation* are not antagonistic. Reason grasps and discerns and even defines the supersensuous. It is part of the Divine image in man, and so is naturally predisposed to the reception of the revealed. Many truths sometimes held not to be discoverable by reason are perfectly agreeable to it when discovered. The *ethnic religions* were clearly media of Divine revelation. They were partial disclosures of God to man—a feature in His gradual unveiling of Himself. They were preparatory to Christianity. *Pagan philosophy*, in the persons of some of its brightest lights, was a forerunner of the written word. Men like Socrates, Plato, and Aristotle among the Greeks, and Cicero, Epictetus, and Marcus Aurelius among the Romans, had wonderful glimpses of truth, and formulated admirable moral codes. They have been described as Christians without knowledge of the Christ. In fact, natural and revealed religion are now widely viewed as parts of a great whole, and not as distinct and separate manifestations of the Divine. Much of the teaching of revelation, technically so called, consists in the unveiling to us of nature and of life. Revelation does not merely superadd to the achievements of human knowledge. It penetrates to the moral and spiritual meaning of the world in which we live.

The advocates of a special revelation maintain that, despite all this, the fact remains that

the disclosure of the Divine in revelation generally is but partial, and therefore preparatory to a specific revelation. Man in his intellectualty was painfully sensible of the soul sickness of the world, but he had no cure. To break the power of sin and quicken the higher and spiritual life he needed a revelation of fatherly love. The deepest deprivations and loftiest achievements of the human intellect needed to be supplemented by a special revelation. "The world by wisdom knew not God." The specific revelation was given in the written word. It may be divided into three epochs, the primitive revelation or protogospel, the covenant revelation to Israel, and the revelation in the appearance of Jesus Christ. The Incarnation (q.v.) is held to be the culmination of every Divine manifestation, the central point of all history, sacred and profane (Heb. i. 1 and 2). The Old Testament represented a gradual process of education, as evinced, for instance, in the voice in the garden, the theophanies, the burning bush, and dreams and visions. God gave to men as they were able to receive. But the message became more and more explicit as the history of the ancient people was developed, until it culminated in Jesus Christ, in whom men saw "God manifest in the flesh" (John i. 18). The Old Testament is meaningless without the New. The Bible message is incomplete without the story of the Christ.

In discussing the specific revelation of the Scriptures it should be borne in mind that *revelation* and *inspiration* are not synonymous terms. Scientific theology distinguishes between them as to both authorship and function. The author of revelation, in the Old Testament and the New, is held to be the Divine Word, the *Logos* (John i. 1 et seq.). The author of inspiration is the Holy Spirit (II. Peter i. 21). *Revelation* has been limited to the direct communication from God to man of (1) such knowledge as man could not attain to in and of himself, and (2) information which, though attainable in the ordinary way, was not, in point of fact, known to the person who received the revelation. *Inspiration* is explained as the actuating energy of the Divine Spirit, under whose guidance the human agents chosen by God have officially proclaimed His will either by (1) word of mouth, or (2) the committal to writing of the several parts of the Bible.

REVELATION OF SAINT JOHN. THE. The name given in the English Bible to the last book in the New Testament. In early lists and manuscripts it is called the Apocalypse of John, the current English title, Revelation, being from the Latin equivalent of the Greek word *Apokalypsis*, the first word of the book.

I. THE NATURE OF APOCALYPTICAL LITERATURE. The Book of Revelation belongs to a distinct class of literature, which has been called,

after the title of this book, apocalyptic. (See APOCALYPTIC LITERATURE.) Only in the light of this classification can the book be understood. The purpose of an apocalypse is usually to explain the present dominion of evil in the world, and to encourage faith by retelling the approaching end of evil and the fulfillment of the prophetic hopes. The explanation of evil is usually found in the angel-world, and the consummation hoped for is a new world-age, which will come by a miraculous deed of God. Man can do nothing but wait for it with patient faith, and the seer's art consists chiefly in discovering the time and manner of its coming. This he does by such a fitting together of ancient prophecies and apocalyptic images with the events of his own time as shall give assurance that the longed for end is at hand.

Turning to the Book of Revelation, there can be no doubt that it is an apocalypse in the sense just defined, and the presumption that it is to be interpreted as such is strong. Like Daniel, it was written in a time of religious persecution at the hands of the ruling kingdom of the world, and its aim was to encourage the faithful to resist the allurements and endure the violence of the world power in view of the speedy coming of judgment and deliverance. Like Daniel, it has the course and end of world-history in view, and not principally the destiny of the individual soul. Other apocalyptic features of the Book of Revelation are its constant use of the vision form with angelic interpreters; its abundance of highly wrought and fantastic imagery, derived in large part from the Old Testament and from apocalyptic traditions, though freely combined and applied to new conditions; its explanation of the present dominance of evil as due to angel powers, whose malign rule is embodied in the Roman Empire; and its general scheme of the future, which with slight exceptions runs parallel to that of Jewish apocalypses. The mark that distinguishes the book as Christian is the identification of the Messiah with Jesus. We do not find, however, that this involves differences great enough to justify us in separating the book from the class and applying to it different methods of interpretation. It is, then, to be assumed that the predictions of the book concern the immediate and not the distant future, as indeed the writer explicitly affirms (i. 1, 3, xxii. 10-12). There is every probability that the earthly representative and agent of the power of evil is the Roman Empire. We shall expect to find visions or fragments from earlier writings or traditions, and to be able to distinguish between their earlier setting and application and the meaning our author gives them. Furthermore, we shall expect to find the value of the book to lie not in disclosures of the course of Church history down to the present, nor in predictions of still future events, but, historically, in its fitness to meet a great crisis in the life of the early Church, and permanently in its underlying faith in God and the certain victory of His cause.

II. CONTENTS AND PLAN. After the opening admonitions, in the form of letters, to resistance and endurance, the book sets forth the approaching judgments which will lead up to the destruction of Rome and of the satanic beings that inspire and sustain it, and to the final blessedness of the faithful. The progress of the successive visions is not, however, simply chronological, for

we seem to have reached the final judgment and consummation already in chs. vi-vii. The movement is rather toward greater concreteness and detail, and the writer is interested in accumulating a variety of figurative and prophetic materials for the expression in stirring and impressive ways of his one message that the day of God's coming to bring evil to an end and good to its rights, and its glory, is close at hand. The first suggestion of a plan is found in the successive sevens, the seals, the trumpets, and the vials, but these do not include various important sections of the book. The contents of the seventh seal seems to be set forth in the new series of seven angels with trumpets (viii. 1-5), and the seventh trumpet (xi. 15-19) is followed, but not at once, by the seven vials of God's wrath (xv.-xvi.). But chs. vii., x.-xi. 14, xii.-xiv., xvii.-xxii. have no proper place in this scheme, and justice is not done to the new beginning in ch. x. It is therefore better to divide the book somewhat as follows: Introduction (i. 1-8) I. The Seven Letters (i. 9-iii. 22). II. Preliminary Judgments (iv.-ix.). (1) The actors: God (iv.); Christ (v.); Destructive Powers (vi.); (2) Promises (vii.); (3) Judgments (viii.-ix.). III. Final Judgments (x.-xx.). The Prophet's new commission (x.); Promises (xi. 1-14); Summary or Prelude (xi. 15-19); the Actors: Satan (xii.) and the Roman Empire and emperor-worship (xiii.); Summary promises and warnings (xiv.); Judgments culminating against Rome and its Satanic upholders (xv.-xx.). IV. The Consummation (xxi.-xxii. 5). Conclusion (xxii. 6-21). There are departures from any strict order, which are probably due in part to the use of unrelated sources, and in part to the author's practical aim, which leads him by anticipation to introduce encouraging voices and visions here and there before the end.

III. THE INTERPRETATION. The curious history of the interpretation of this book cannot here be reviewed. It has been supposed to have been written against Mohammed and the Turks; against the Pope and the Roman Catholic Church; against Luther and the Reformation; against Napoleon, etc. Many still hold that the book predicts the whole course of Church history past and to come. The form in which this so-called *Church historical* or *continuously historical* interpretation has still some advocates among scholars (Auberlen, W. Milligan, Benson) is that according to which the book contains in its symbols, not the definite events, but the conflicting powers or principles, good and evil, of Christian history. Almost all scholars, however, seek for the meaning of the book in the conditions of the writer's own time.

The Roman Empire is recognized as the persecuting and godless power, the agent of Satan, whom the book assails and whose fall it announces. Isolated scholars of far older times knew this, but it was especially the work of Lücke, Bleek, and Ewald that established it. With this is commonly connected the view that Nero was the wounded head (xiii. 3), the name signified by 666 (xiii. 18), and the one whose return from Hades and attack upon Rome in alliance with the Parthians is predicted in chapter xvii. The number 666 may, however, stand, as Clemen has recently argued, for ἡ ἑξάτη βασιλεία, the Latin Kingdom.

In different parts of the book different periods

and different types of religious and Christian thought appear to be indicated. These facts, together with the breaks in the plan of the book already referred to and the composite character of some Jewish apocalypses, have led to the effort to solve the remaining obscurities by literary analysis, and the theory of various dates and authors. Weizsäcker suggested in 1882 that the writer incorporated some older oracles, Jewish or Christian, such as vii. 1-8, vii. 9-17, xi. 1-13, xiii., xiv., xvii. Vischer, on the other hand, proposed the view that the book is a Jewish apocalypse (iv. 1-xvii. 5, omitting obvious Christian amendments), set in a framework (i. iii., xvii. 6-21) and slightly revised by a Christian hand. This theory came out in 1886 with Harnack's indorsement and was accepted by several German critics. More elaborate analyses followed. Two Jewish apocalypses were found in the book by Weyland, and Spitta (1889) made the original book a Christian apocalypse by John Mark (A.D. 60), to which a later Christian added two Jewish apocalypses of the times of Caligula and Pompey. Against this method there has been a reaction in favor of the simpler view of Weizsäcker. The unity of the book is maintained, but the writer is believed to have made use of materials already shaped by earlier hands, and in part Jewish in origin. The Jewish character of vii. 1-8 and of xi. 1-13, with its date before A.D. 70—Jewish oracles applied in a figurative sense to Christians as the true Israel—and some of the peculiarities of xii., xiii., xvii., and other passages, may thus be explained in a way consistent with the ascription of the book to a Christian writer of Domitian's reign.

The next problem naturally is concerned with the first meaning of these incorporated materials. The most important study in this direction is that of Gunkel in reference to chapter xii. (1895). His theory is that the dragon who seeks to kill the child and persecute the mother is ultimately derived from a Babylonian account of the birth of Marduk, the sun-god, destined to destroy the chaos-dragon and to create the world. Many who have not accepted Gunkel's reconstruction of an otherwise unknown part of the Babylonian myth have approved in general his emphasis on tradition as a great factor in the production of an apocalypse, and many have assented in particular to his theory that a sun-myth underlies chapter xii., whether Babylonian or Greek (Dieterich) or Egyptian (Bousset) in origin. Wellhausen has objected to the method and declared that the writer's own meaning is all we need to inquire after, and that he has shaped his figures to represent current events to a much greater degree than Gunkel allows. Bousset, one of the most important recent writers on the subject, adheres in general to Weizsäcker's idea of the composition of the book and to Gunkel's view of the significance of tradition. He put forth the hypothesis that an apocalypse of Antichrist, of Jewish origin, was current in New Testament times and on into the Middle Ages, that it was not dependent on Revelation, but that several of the fragmentary (Jewish) traditions which Revelation incorporates were derived from it (vii. 1-8, xi. 1-13, xiii. 11-17, xiv. 14-20).

Over against the fixity of apocalyphtical tradition, rightly emphasized by Gunkel and Bousset, it is necessary to recognize the fact that the writer of Revelation used Old Testament ma-

terial with much freedom, and in the spirit of a poet, rather than in that of a hudd bound scribe. This is illustrated by such passages as i. 12-20, iv., xviii., xxi., xxii. 5. The author writes as one whose mind is filled with Old Testament prophetic language; one who is almost limited to it for the expression of his thoughts, yet uses it freely and puts into it the emotions of his own soul. That his emotions were intense is a fact that must be seriously reckoned with in studying his book, whatever one may think about the question of actual ecstasy.

IV. HISTORICAL OCCASION, PURPOSE, AND DATE. The Seven Letters (chapters i, iii.) are the most original part of the book and contain the most specific references to concrete conditions. Though addressed to actual churches whose conditions the writer knows, they are evidently meant, taken together, to give the message of the spirit of Christ to all His churches. The seven cities are named in geographical order, moving from Ephesus north, east, and south. The worship of the Emperor had been enforced in this region for a long time. Pergamum had a temple to Augustus in B.C. 29 and remained the centre of the cult in Asia (cf. Rev. ii. 13). The Book of Revelation was written chiefly to encourage Christians to resist this worship at whatever cost and to warn those who were falling away under its pressure and the enticements of the heathen thought and life that went with it. This cult is the second beast of chapter xiii., and all who take part in it are threatened with the impending fate of Rome itself, while those who resist it even to death will receive a glorious reward. Some persecutions of Christians had already been endured (ii. 3, 13, iii. 8), but far more severe trials were at hand (ii. 10, iii. 10) for which the book would prepare the way. The glory and reward of martyrdom are its theme. An official persecution of Christianity such as is here contemplated points to a time not earlier than Domitian. The relaxation of earlier zeal, the loss of love, the adoption of heathen ways of living, which the letters condemn, indicate the same period, as does the fact that Paul's position as founder of the church at Ephesus appears to be wholly a thing of the past. It is true that xi. 1-13 dates from before A.D. 70, but it is no less certain that it was originally a Jewish oracle. Its application in a figurative sense to the safety of the true worshipers of God, that is Christians, in the approaching crisis shows that the literal siege and fall of Jerusalem had long ago proved the oracle to be in its literal sense—which was indeed contrary to the word of Jesus—untrue. In xvii. 10, Vespasian seems indicated, but verse 11 is probably meant to carry us over into Domitian's reign. If the Nero myth is referred to in chapter xvii., this also, in this form, belongs to the close of the century. We may therefore conclude that the book was written, as Trengg says, "near the end of the reign of Domitian," that is about A.D. 93-96.

V. THE CHRISTIANITY OF THE BOOK. The relation of the book to Paulinism is an unclouded problem. The stress it lays upon the transcendence of God, and upon the kingly and judicial functions of Christ, its view of salvation as a reward for overcoming the world and keeping the commands of God, are Judaistic aspects of the religion of the book. Its attitude toward Rome, also, is not that of Christ (Mark xii. 17) and

of Paul (Rom. xiii. 17, cf. 1 Pet. ii. 13-17). Yet the anti-Pauline tendency need not be inferred. Circumstances had changed, and Rome had become the power of lawlessness, instead of the one who restrained that power (11 Thess. ii. 7), so that Antichrist would inevitably take on a Roman in place of a Jewish form. Furthermore, even against the Jewish-Christian traits of the book we find a Christology not unrelated to Paul's (cf. i. 5, iii. 14, with Col. i. 18, and Rev. v. 9 sqq. with Phil. ii. 5 sqq.), an eschatology at many points in striking agreement with his, and a universality which at least is totally different from the exclusiveness of Paul's Judaistic opponents (vii. 9 sqq.). We cannot therefore with Baur regard Revelation as a simple product of the Jewish Christianity which opposed Paul. It is probably best to say that the book represents a late development of primitive Christianity, not much influenced either way by Paul.

VI. CANONICITY AND AUTHORSHIP. The place of Revelation in the canon has been much disputed. It was accepted in the Western Church after Hippolytus wrote in its defense against Caius, a Presbyter of Rome (c.215). For a long time the Eastern Church refused to recognize the book as canonical. Eusebius records and sympathizes with the objections of its critics. It was not in the original Syriac New Testament. The pressure of the Western Church finally secured its place in the canon. In the West only Jerome shows some sympathy with Eastern doubts. Its place in the canon was again somewhat insecure at the beginning of the Reformation—Luther in the first edition of his New Testament expressed a strong aversion to it, because of its obscurity, and especially because he did not find in it the Pauline gospel. Later he expressed a more favorable judgment. Zwingli did not accept it as canonical. Calvin at least did not comment upon it.

The writer calls himself John (i. 1, 4, 9; xxii. 8), and says that he saw his visions on the island of Patmos (q.v.), where he was, it would seem, in banishment. Justin Martyr is the first to identify this John with the Apostle, and from Irenæus and Tertullian onward this view was almost unquestioned. Yet Dionysius of Alexandria (c. 255) argued on the basis of a comparison with the fourth Gospel that the author of Revelation was another John; and Eusebius suggested the Presbyter John, of whom Papias speaks. The earliest opponents of the canonicity of the book, the Alogi, ascribed it to the Gnostic Cerinthus, an idea adopted by Caius. The author himself does not say that he is an Apostle (see on the contrary, xxi. 14; xviii. 20), and nowhere reveals any personal knowledge of the earthly life of Jesus. It cannot quite be said that he assumes a position of personal or official authority over the seven churches. He is their brother and fellow in trial (i. 9), but the authority that speaks through him is Christ. He claims only to be a true prophet, truly to convey the message of Christ. For his book he makes great claims, but not for himself. Of the three possibilities; that it is by the Apostle; that it is a pseudonymous writing, in the Apostle's name; and that it is by another John—the second can with some confidence be rejected. For though pseudonymity characterizes all Jewish apoca-

lypses, we find here none of the familiar signs of it, no references to known events in the life of John such as we should expect. If the Apostle were the recognized head of the churches of Asia, centring in Ephesus, during the last quarter of the first century, the expression "John to the seven churches" (i. 4) would suggest him. If that place was occupied by John the Presbyter, he would be the one indicated. The most serious difficulty in the way of accepting the Apostle's authorship is the radical difference in style and in conception that separates the Apocalypse from the Gospel. Though minor points of likeness exist, the difference is so great that it seems almost impossible to ascribe them to one mind. The difficulty is greater now that it is no longer probable that they can be separated widely in date by putting Revelation before A.D. 70. The question of authorship must therefore remain open, but this question does not affect our view of the value of the book and the way in which it is to be understood.

BIBLIOGRAPHY. The Church-historical view can be read best in Milligan, *Commentary on the Apocalypse*, Baird Lectures (London, 1886); id., *Discussions on the Apocalypse* (ib., 1893); id., *The Book of Revelation*, Expositor's Bible (New York, 1899); and in Benson, *The Apocalypse* (London, 1900); the older critical view (contemporary-historical), in the commentaries of Lücke (2d ed., Bonn, 1848-52); Bleek (Berlin, 1862); and Ewald (Göttingen, 1862). Consult also the commentary of Alford (London, 1867). The best recent commentaries are those of Bousset (Göttingen, 1896) and Holtzmann (Freiburg, 2d ed., 1893), and in English, Simcox, Cambridge Bible (Cambridge, 1898), and Scott, Century Bible (Edinburgh, 1902). Consult further the introductions to the New Testament by Weiss (London (1887); Holtzmann (Freiburg, 3d ed., 1892); Zahn (Erlangen, 1897-99); Jülicher (Tübingen, 3d ed., 1901), and Moffatt, *Historical New Testament* (New York, 1901); the New Testament theologies by Weiss (Edinburgh, 1885); Holtzmann (Freiburg, 1896); Stevens (New York, 1899); Wernle, *Beginnings of Christianity* (London, 1903); and *Histories of the Apostolic Age* by Weizsäcker (London, 1894), McGiffert (New York, 1897), and Bartlet (London, 1900). REVENUE, PUBLIC. See FINANCE; TAXATION.

REVENUE CUTTER SERVICE, UNITED STATES. A military service, organized by act of Congress in 1790, for the enforcement of navigation and customs laws. It was the first armed maritime force of the Government, having been constituted about eight years before the United States Navy. There being no naval establishment at that time, the service, as a matter of convenience, was attached to the Treasury Department, then presided over by Alexander Hamilton, where it has since remained. Its first fleet consisted of 10 small, single-masted, light-draught sail-

ing vessels, manned with 10 masters, 30 mates, 40 mariners, and 20 boys. By degrees, and as occasion arose, the service was augmented in strength and armament, and on July 1, 1799, Congress authorized the President to "cause the revenue cutters to be employed to defend the sea-coast and to repel hostility to vessels and commerce within their jurisdiction." The rapid growth of foreign trade, and a shipping interest that was constantly developing at home, created the necessity for more efficient means of protection, and swifter cruisers, better armed, manned and equipped, were gradually added to the force. The duties of these vessels were extended to the suppression of piracy that had become common on account of the many adventurers attracted to American waters. A distinctive revenue ensign and pennant were provided by law. (See Colored Plate in article FLAG.) Beginning in 1813, steamers were introduced, and they have entirely superseded the old type of sailing cutters.

Revenue cutters have participated in all the wars of the United States except the Algerine war, and have been prompt to respond to any emergency. In 1797, when France assumed a belligerent attitude, and during the troublous times that followed, the cutters aided in maintaining the dignity and position of the Government. Seven of them were employed in the waters of the West Indies. The Embargo Act of 1807, intended to countervail Napoleon's decrees, put the service into special requisition in guarding the seaboard and preventing the departure of unauthorized merchant ships. In the War of 1812 its force was actively engaged in patrolling the coast and repelling foreign invasion. During the nullification troubles of 1832-33 several revenue vessels were stationed off Charleston ready to enforce the execution of the tariff laws. At the time of the Seminole War, in 1836, they transported troops and munitions, and afforded protection to settlers along the coast. In the war with Mexico eight vessels shared in the naval attacks on Alvarado and Tabasco and cooperated with the naval squadron. In 1858 the steam cutter *Harricot Lane* took part in the naval expedition to Paraguay, and was considered one of the most efficient ships of the fleet. During the Civil War the cutters were busily engaged conveying dispatches, pursuing blockade-runners, doing guard and reconnaissance duty, and joining in attacks on the enemy's forts and batteries. Throughout the war with Spain 20 vessels of the service, carrying 71 guns, 131 officers, and 725 men, were employed with the army and navy, while 3, just constructed, with 25 officers and 210 men, were under orders to go to the front when the war closed. Eight cutters were in the North Atlantic squadron on the Cuban blockade, 4 cooperated with the navy on the Pacific coast, while one was in the Battle of Manila Bay.

In 1903 there were in the service 44 vessels, 17 of them harbor and anchorage boats, steam launches, etc., 1 a practice bark, and the remaining 26 steamers ranging from 152 to 869 tons burden. Those built of steel in recent years are admirable models of marine design and architecture and are among the fastest of their class afloat. Nearly all have been constructed under the immediate supervision of officers of the corps and devised with special reference to the general needs of the service. They are usually armed

with from 2 to 9 improved rapid fire guns, and are provided with necessary small arms for the use of the crews. In time of war their equipment may be readily augmented. The vessels are kept prepared, as far as possible, for prolonged voyages and the performance of any duty that may be legally assigned them. In this connection it may be stated that about all the early authentic information concerning the natural features of Alaska, its climate, the characteristics of the natives, and the resources of that country, were obtained by explorations made by officers of the revenue cutter service. Several vessels make cruises each year into the Bering Sea and Arctic Ocean for the protection of the fisheries and Government interests.

The active list of the service comprised, in 1903, 37 captains, 37 first lieutenants, 37 second lieutenants, 37 third lieutenants and cadets, 1 captain of engineers, 35 chief engineers, 17 first assistant engineers, 18 second assistant engineers, and 1 constructor, and in addition about 1000 petty officers and seamen. The officers of the engineer corps rank with line officers of corresponding grades, and the constructor has the rank of first lieutenant. All are commissioned by the President, by and with the advice and consent of the Senate, and, under the law, rank is held as follows: Captains with majors in the army and lieutenant-commanders in the navy; first lieutenants with captains in the army and lieutenants in the navy; second lieutenants with first lieutenants in the army and lieutenants (junior grade) in the navy; third lieutenants with second lieutenants in the army and ensigns in the navy. When revenue cutters serve in cooperation with the navy, pursuant to law, their officers hold rank with and next after naval officers of the grades named. The commissioned officers of the service receive the same pay and allowances as officers of corresponding rank in the army, and are retired for physical disability or on reaching the age of 64 years. Promotions are made, in the order of seniority, to fill vacancies which may occur in the various grades, after the candidates have qualified by a professional examination.

In 1876 Congress enacted a measure permitting the Secretary of the Treasury to appoint cadets to fill vacancies occurring in the grade of third lieutenant. The object was to provide means for educating young men for deck officers. Under the operation of this system nearly two-thirds of the active list of the line in 1903 were composed of cadet graduates. Some 10 additional appointments have been made from graduates of the Naval Academy. Before the cadet system was organized candidates from the merchant marine and volunteer navy were admitted directly to the grade of third lieutenant. An applicant for a cadetship must be not less than 18 nor more than 25 years of age, of vigorous constitution, physically sound and well formed, not less than 5 feet 3 inches in height, of good moral character, and unmarried. He is required to pass a satisfactory entrance examination in spelling, geography, general history and Constitution of the United States, grammar, composition and rhetoric, arithmetic, algebra, geometry, trigonometry, physics, English literature, one modern language (either French, German, or Spanish), and general information. The examination, which is open to all qualified

persons, is held annually under the direction of the Civil Service Commission. From those passing highest, provided they reach the required standard, a class is formed which is ordered to report for instruction on the practice ship *Chase*. The term on the practice ship covers a period of three years and comprehends a strict course of discipline and instruction in all matters pertaining to the professional requirements of an officer. A cadet receives \$500 per annum and one ration per day, and must provide himself with the prescribed uniforms. At the expiration of his probationary term of three years, if his deportment and progress have been satisfactory, he is rewarded with a commission as third lieutenant. Original appointments in the engineer corps are made from civil life upon thorough examinations.

The work of the Revenue Cutter Service, as defined by law, consists in the enforcement of about every statute bearing upon the maritime interests of the nation. Its duties embrace the protection of the customs revenue; the enforcement of the laws against smuggling, those pertaining to national quarantine, the neutrality laws, the navigation laws, including vessels' documents, and all requirements in regard to the rules for preventing collisions, officers' papers, steamboat inspection, and passenger service; the laws in suppression of piracy, robbery, and mutiny on the high seas; those for the protection of the seal fisheries and sea-otter hunting grounds in Alaska, and for the prevention of illegal traffic in firearms, ammunition, etc., in that territory; the laws for the protection of wrecked property and the timber reserves of the United States; the laws for the suppression of the slave trade; those that require necessary life-saving appliances to be kept on board merchant vessels; the laws in regard to the anchorage of vessels in the ports of New York and Chicago, in the Saint Marys River, Michigan, etc., and the regulations to insure the safety of observers of and participants in regattas on navigable waters. During the dangerous and inclement season, from December 1 to April 1 of each year, revenue cutters are, by direction of the President, required to cruise actively along the coast to afford aid to vessels in distress. Those detailed for such duty are provided with special supplies, including extra provisions for the shipwrecked, and are instructed to extend to all requiring relief such assistance as may be adapted to their condition and necessities. The cutters on the Great Lakes are, during the period of open navigation, charged with similar important work. An important function of revenue cutter officers is their connection with the Life-Saving Service (q.v.). They are detailed to do the inspection work of the latter and to drill the surfmen in the use of life-saving apparatus, and to see that the equipments of the stations are kept in efficient condition. Several officers are also assigned to superintend repairs and the construction of new stations. Besides the fixed duties of the service there are numerous others which it is called upon to perform from time to time, such as aiding the Public Health and Marine Hospital Service, the Lighthouse Establishment, the Coast Survey, the Fish Commissioner, the ocean telegraph lines, etc. Each vessel has assigned to her a certain district, within which she carries out her specified duties. The districts on the Atlantic and Pacific seabards and the Great

Lakes are contiguous and therefore cover the entire coast of the United States.

REVERBERATORY FURNACE. See IRON AND STEEL; LEAD.

REVERE, ré-veer'. A town, including three villages, in Suffolk County, Mass., five miles north by east of Boston; on the Boston and Maine and the Boston, Revere Beach and Lynn railroads (Map; Massachusetts, E 3). It is finely situated on the Atlantic coast, and is an attractive residential place and a summer resort. Revere Beach has a bath-house built and maintained by the State, and is one of the most popular bathing resorts on the Massachusetts coast. It has also a splendid boulevard. There are a handsome town hall and a public library with 7000 volumes. Revere was settled in 1626 and, under the name of Rumney Marsh, formed a part of Boston until 1738. Incorporated as Chelsea in 1739, it was set off and reincorporated as North Chelsea in 1846, and received its present name in 1871. Population, in 1890, 5668; in 1900, 10,395.

REVERE, rā'vā-rā, GIUSEPPE (1812-89). An Italian poet, born at Triest. He wrote for *La Concordia*, a liberal journal of Turin; took part in the events of 1848; and afterwards lived in Turin, Genoa, and Rome. He began his career as a dramatist with a series of historical plays, in the form made popular by Niccolini. He also wrote the historical works, *La cacciata degli Spagnuoli da Sicilia* (1847); the poetical works, *Sdegno e affetto* (1845), *Nuovi sonetti* (1846), *Personi ed ombre* (1862), *Osiride* (1879); and two volumes of sketches, *Bozzetti alpini* (1857) and *Marine e paesi* (1858).

REVERE, PAUL (1735-1818). An American patriot, born in Boston, Mass. He learned from his father the trade of a goldsmith and soon became skillful as an engraver on silverware. In 1756 he served as a lieutenant in the Crown Point expedition, and, returning to Boston, established himself as a goldsmith and a copper-plate engraver. He was a member of the grand jury which in 1774 refused to serve on account of the act of Parliament making judges independent of the legislature as regards salary. He engraved the plates and printed the paper money ordered in 1775 by the Provincial Congress, and in the same year established a powder mill in Boston. He early took an active interest in the disputes with the English Ministry, participating in the "Tea Party" (1773) and carrying the news of it to New York and Philadelphia, and in 1774 became a member of a society organized to watch the British in Boston. On April 18-19, 1775, at the request of Joseph Warren, he made his memorable midnight ride to Lexington to warn Hancock and Samuel Adams of the approach of English troops, arousing the people on the way. Then, passing on toward Concord with William Dawes and Dr. Samuel Prescott to warn the people there, he was captured by a party of British soldiers and was brought back to Lexington, where he was released on the next day. This ride has been made the theme of a celebrated poem, *The Midnight Ride of Paul Revere*, by Longfellow. Subsequently becoming lieutenant-colonel of State artillery, Revere accompanied the unsuccessful Penobscot expedition in 1779.

REVERIE, or **REVERY** (Fr. *réverie*, OF. *reveserie*, from *reveser*, *rêver*, *reveser*, to rave, from

Lat. *rabics*, rage, from *rabere*, to rage). A word borrowed from the French, and somewhat loosely used to signify a state of mind obtaining during waking life and characterized by neglect of present surroundings, meditateness or abstraction. True reverie, like the dream of sleep, is marked by a condition of discursive, passive attention. There is, to be sure, abstraction, forgetfulness of one's environment, but the trend of consciousness is not toward any definite goal. Like the dream, too, the reverie is apt to be fleeting and easily forgotten. Its fancifulness and fleetingness is but another evidence of the lack of control by active attention. Consult: Titchener, *Outline of Psychology* (New York, 1899); James, *Text-book of Psychology* (New York, 1892); Carpenter, *Mental Physiology* (London, 1888). See ASSOCIATION OF IDEAS; ATTENTION; DREAMING; HYPNOTISM.

REVERSION (Lat. *reversio*, from *revertere*, to turn back, from *re-*, back again, anew + *vertere*, to turn; connected with Skt. *vart*, Ochurch Slav. *vrātiti*, *vratiti*, to turn, Goth. *vairpan*, AS. *veorpan*, OHG. *werdan*, Ger. *werden*, to become). A form of heredity (q.v.). Cases occur where an individual inherits not its parents' physical or mental characteristics, but those of its grandparents, or more remote ancestors. This happens in cultivated plants and domestic animals artificially bred from wild forms. If such forms are neglected or return to free nature, i.e. run wild, they tend to 'revert,' 'throw back,' i.e. to transmit the characteristics of the original wild species or variety. Darwin remarks that reversion may be divided into two classes: (1) Those occurring in a variety or race which has not been crossed, but has lost by variation some character that it formerly possessed, and which afterwards reappears; (2) all cases in which an individual with some distinguishable character, a race, or species, has at some former time been crossed, and a character derived from this cross, after having disappeared during one or several generations, suddenly reappears. He gives extensive examples in illustration, and concludes that a tendency to atavism is "an integral part of the general law of inheritance." In breeding zebra-hybrids by crossing mares of various sizes with a male zebra, the hybrids, says Ewart, showed a curious blending of characters, derived apparently partly from their actual and partly from their remote ancestors. As the result of Ewart's experiments some of the hybrids in make and disposition strongly suggest their zebra sire, others their respective dams, but even the most zebra-like in form are utterly unlike their sire in their markings, probably taking after an ancestor thousands of generations removed. Consult: Darwin, *Variation of Animals and Plants Under Domestication* (London, 1888); Ewart, *The Pangenetic Experiments* (London, 1899). Compare ATAVISM.

REVERSION. The residue of an estate or interest remaining in a grantor of real property who has conveyed away one or more estates in it, amounting to less than a fee simple in quality and duration. A reversion is said to arise by operation of law, that is, without special act of the parties to a conveyance, and in this respect it differs from a remainder, which must be created by express words in a conveyance. See REMAIN-

DER. Consult the authorities referred to under REAL PROPERTY.

REVETMENT (Fr. *revêtement*, from *revêtir*, OF. *revestir*, to line, from *re-*, again + Fr. *vêtir*, OF. *vestir*, to clothe, from Lat. *vestire*, to clothe, from *vestis*, garment). An important device in both permanent and field military fortifications. In the former, it is usually a retaining wall of masonry, built for the purpose of holding back or strengthening the earth of which the works are composed. Revetments are ordinarily used for the escarp (q.v.) and counterscarp (q.v.) of the ditch (q.v.), the more important being the escarp, which has to hold back the great mass of earth represented by the rampart, the parapet, and the banquette. It is usually of solid brickwork or stone, about 5 feet thick at the top, and sloping outward as it descends (on the ditch side only) about 1 in 6. Additional strength is obtained by reinforcing the revetment wall by massive buttresses at intervals of 15 feet, called *counterscarts*, and these again are sometimes connected and strengthened by masonry arches outside the revetment. In field works the amount of resistance offered by a redoubt or similar fortification to the artillery fire of an enemy will greatly depend on the character of the revetments, which may be of sods, timber, hurdles, or gabions (q.v.). See FORTIFICATION; REDOUBT; and SIEGE AND SIEGE WORKS.

REVIEW (OF., Fr. *revue*, from *revoir*, to re-view, from Lat. *revideri*, to see again, from *re-*, back again, anew + *videre*, to see). A military parade, followed by inspection and review, the latter usually consisting of a salute tendered to the reviewing officer as the troops march past. This ceremony to-day is merely an exhibition of number, equipment, bearing, discipline, physique, and general condition, and consequently is treated almost exclusively as a compliment to a distinguished visitor, or as the finale to a field day. In the United States Army, reviews may be held by a battalion, regiment, brigade, division, or corps; but only on such occasions and for such purposes as are authorized by army regulations.

REVIEW. See PERIODICAL.

RÉVILLE, ră'vèl', ALBERT (1826-). A French Protestant clergyman and author, born at Dieppe (Seine-Inférieure). He studied at Dieppe, Geneva, and Strassburg; was for a time vicar at Nîmes, later pastor at Lumeray, near Dieppe, and in 1851 became pastor of the Walloon Church at Rotterdam. In 1873 he returned to Dieppe, where he pursued philosophical studies until his appointment as professor of the history of religions in the Collège de France. He also became president of the section of religious sciences in the Ecole Pratique des Hautes Etudes. He ranked as one of the most advanced representatives of the French liberal Protestantism of his time. His publications include a translation (1849) of Whately's *Introductory Lessons on the History of Religious Worship* (London, 1849), *Essais de critique religieuse* (1860; 2d ed. 1869), *Theodore Parker, sa vie et ses œuvres* (1865), *Deux sermons* (1874), *Prophétismes de l'histoire des religions* (1881), and the *Histoire des religions* (1883-89), his most extensive and important work.

REVILLOUT, ră'vèl'vut', EUGÈNE (1838-). A French Egyptologist, born at Besançon. He

was educated for the Church, but preferred Oriental studies, entered the department of Egyptian antiquities at the Louvre as an assistant in 1809, aided in founding the Ecole du Louvre in 1880, and in 1881 became professor and curator of the Egyptian collection of that museum. Revillout's great work was the publication of the *Christomathie demotique* (1878-80), supplementing Brugsch's discoveries in the demotic language. Besides, he specialized on Egyptian law, founded, with Brugsch and Chabas, the *Revue Egyptologique* in 1880, and published: *Papyrus coptes* (1876), *Le roman de Setna* (1880), *Corpus Papyrorum Egypti* (1885-92), *Cours de droit égyptien* (1885), *Cours de langue demotique* (1885), *Lettres sur les monnaies égyptiennes* (1895), *Mélanges sur la métrologie, l'économie politique et l'histoire de l'ancienne Egypte* (1897), and *Précis du droit égyptien* (1899-1903).

REVISED STATUTES. The acts of the legislatures of the various States and of Congress are usually printed and bound into volumes after each session of those bodies. This is done by an authorized printer under the supervision of a State official, usually the Secretary of State, who compares the acts as thus printed with the original copies thereof, and certifies as to their accuracy. Such publications are known as the *statutes at large*, and include all acts whether general or local in character. After a large number of these volumes have been issued, covering a considerable number of sessions, it naturally follows that many of the acts found in the earlier volumes are repealed or amended by acts reported in the later ones; and that some statutes have become practically obsolete by reason of changed conditions. Under these circumstances, it is necessary to examine all the 'year books,' as such volumes are usually called, in order to determine the statute law on any given subject. In order to render the statute law more accessible, settle positively any questions as to the intention of the legislature in passing acts repealing former ones, and to cure any defects in form or substance which have become apparent in existing statutes, most of the States have at some time authorized thorough revisions of their statute law. The work is usually done by a committee of the State legislature, who arrange the existing statutes under general heads, and draft such amendments and alterations as are deemed advisable. Strictly local or special statutes are sometimes omitted in the revision. The general laws, as thus collected, arranged and amended, are re-enacted and then constitute the official revised statutes, superseding all original acts. There have been several revisions of the statutes of the United States. For acts supplementary to or amendatory of the revised statutes, the Statutes at Large, published after each session, should be consulted.

REVIVAL OF LEARNING. See RENAISSANCE. HUMANISM.

REVIVALS (from *revire*, from Lat. *revivere*, to live again, from *re-*, back again, anew + *vivere*, to live). **RELIGIOUS.** A term widely used among Protestants since early in the eighteenth century, to denote periods of marked religious interest, when church members are quickened to a new sense of responsibility and privilege, and others are for the first time brought openly to

confess their faith. By an extension of its meaning, the term is sometimes applied to various important religious movements of the past, like that of the Day of Pentecost (Acts ii.), of the Wiclifites in England, the Hussites in Bohemia, and the Reformers of the sixteenth century. In a similar way it might be used of the religious zeal which led to the First Crusade, the work of the great monastic Orders in some periods of their history, the Oxford Movement, and so on. But it is more accurate and better to limit the application of the term 'revival' to the history of modern Protestantism, especially in Great Britain and America, where such movements have flourished with especial vigor. Yet in so doing, one should not forget that there were similar revivals of religion in Scotland as early as the end of the sixteenth century (under Wishart, Cooper, and Welsh), and again, both there and in the north of Ireland, about a generation later, when Bruce and Livingston were prominent as leaders (the Stewarton Movement).

Seasons of religious quickening occurred in the colony of Massachusetts Bay between 1704 and 1718, but in importance and influence they were far overshadowed by the work of Jonathan Edwards (q.v.) at Northampton in 1734. His preaching so deeply affected his hearers that about three hundred persons were converted. The movement spread through a large part of New England in the next two years, and formed a suitable introduction to 'The Great Awakening,' a revival which extended through almost all the colonies and influenced either directly or indirectly almost all the churches. This movement began about the same time as that of John Wesley in England. Its most active agent was George Whitefield (q.v.), a preacher of singular power and inexhaustible energy, who came from England to America in 1739, and traveled through the country, preaching in the open air to audiences of thousands, and winning a large number of converts. The Great Awakening proper occupied the years 1740-42. Several evangelists were enlisted in its service, notably the zealous but censorious Gilbert Tennent (q.v.), a Presbyterian, who had begun revivalist work in New Jersey before Whitefield's arrival. Among the most obvious results of the Awakening were the addition, between 1740 and 1760, of 150 churches to the number already established in New England and the doubling of the number of Presbyterian ministers in the middle colonies. Princeton College grew out of the movement, and the plan for a school for the education of the Indians was conceived about the same time, from which later came Dartmouth College (q.v.). The Wesleyan movement did for England what the Great Awakening did for America, but with a new and permanent ecclesiastical organization as its product.

Toward the end of the eighteenth century a fresh series of revivals began, lasting intermittently from 1797 to 1859. The beginning of this long period was called, in New England, the 'evangelical re-awakening.' The work was carried on at first by parish ministers, not by traveling evangelists, and the churches soon came to depend upon revivals for their growth and even for their life. As time went on, the work was taken up by itinerant preachers also. Among the prominent leaders were Nathan Strong, Edward Dorr Griffin, Jeremiah Hallcock, Timothy

M. Cooley, and Charles G. Finney. The early years of the nineteenth century were marked by great missionary zeal, reaching out beyond the boundaries of New England, and even to foreign lands. See MISSIONS, CHRISTIAN.

Toward the southwest, in Tennessee and Kentucky, we meet for the first time with 'camp-meetings,' great open-air assemblies, which since 1800 have played an important part in the evangelistic work of the Methodist Church. (See CAMP-MEETING.) Ministers of other denominations at first participated in this movement, special sympathy being manifested by the Presbyterians, but the extreme excitement soon alienated them from it. A considerable number of Presbyterians, however, who continued to believe in the revival theory as there illustrated, withdrew from communion with the main body, and formed the nucleus of what has since become the Cumberland Presbyterian Church. (See PRESBYTERIANISM.) One of the most valuable products of the camp-meeting idea is the Chautauqua Assembly, a highly successful educational enterprise, which is still closely connected with religious work. (See CHAUTAUQUA.) One of the most noteworthy revivals of the whole series was that of 1858-59, which, like the Great Awakening, affected nearly all branches of Protestantism, and was nowhere more successful than in New York City. No account of modern revivals would be complete without prominently mentioning the work of Dwight L. Moody, who for many years exerted a large influence in Great Britain and America, reaching all classes of society.

What is commonly called the revival period of American religious history may be said to have closed soon after the middle of the nineteenth century. Horace Bushnell's work on *Christian Nurture*, published in its completed form in 1861, was undoubtedly a sign of the changing religious temper. Men's minds were turning to other ways of extending the Church's influence as being at once more normal and more promising. The establishment of several theological schools, like Andover, Bangor, Hamilton, Newton, and others, due largely to the interest evoked by the revivals early in the century, tended to promote this very change.

Although revivals mark a temporary departure from the historic method of propagating Christianity, which is by religious training accompanying the sacrament of baptism, yet they are a natural incident in the development of Protestantism. Most of the Protestant churches require some evidence of regeneration before admitting members into their fellowship, and this evidence is most naturally sought in religious experience, especially in the process of conversion. This is commonly understood to mean such a change of heart and disposition, often sudden, as can be wrought only by the operation of Divine grace. This idea laid firm hold upon many American churches, so that conversion came to be regarded as the normal mode of entrance upon the religious life. Baptism continued to be administered, but the significance of infant baptism was largely lost sight of, and the historic system of catechetical instruction generally disappeared. No student of the subject can doubt that large numbers of the conversions were genuine, or that the system of evangelizing, in the hands of earnest and sincere men, has been productive of great

benefit to humanity; but, on the other hand, it is impossible to doubt that grave abuses have appeared in connection with it. Such purely physical phenomena as swoons, outcries, and convulsions were confounded with spiritual experiences. These are now known to belong to the domain of pathology, and to indicate a psychophysical condition, often met with elsewhere in the history of religion and of civilization.

REVOCATION (Lat. *revocatio*, from *revo-care*, to revoke, recall, from *re-*, back again, anew + *vocare*, to call). In law, the annulling, vacating, or cancellation of a legal instrument with intent to make it null and void in effect, or the withdrawal of an authority previously conferred. Where an instrument is made in good faith, and without wrongfully affecting the rights of third parties, it is generally held to be irrevocable, if it conveys property or rights to some one who pays for the same or accepts them as a gift. Powers not coupled with an interest in the donee are revocable.

REVOLT OF ISLAM. TIDE. A poem by Shelley (1818). The original title was *Laon and Cythna*, the names of the chief characters of the story, telling of a nation roused to freedom by a young poet. His triumph is brief, for the hero, Laon, is condemned to be burnt, and his martyrdom is shared by Cythna. The regeneration of society, an echo of the French Revolution, is the leading idea.

REVOLUTION (Lat. *revolutio*, from *revolvere*, to turn over, from *re-*, back again, anew + *volvere*, to turn; connected with Goth. *walujan*, AS. *walujan*, Eng. *wallow*). In politics, a radical change in the fundamental constitution of a State, as opposed to reform, which implies a gradual transformation carried out in accordance with established principles and through legal forms. Usually, though not of necessity, it connotes a popular upheaval in which the will of the masses replaces for the time all laws and authority. The history of every nation presents instances where the organic growth of years and centuries has within a brief space of time been altered or destroyed by a people that has lost faith in the efficacy of orderly evolution. The English Revolution of the seventeenth century once for all established the rights of the nation as against its ruler. The American Revolution, so called, freed the united English colonies on the Atlantic seaboard of North America from the sovereignty of the English Crown and made them free and independent States. The French Revolution of 1789 overthrew the Bourbon monarchy and after three generations of sequential struggles brought in the sovereignty of the French people. It produced a profound effect on the constitution of society and the relation of peoples and sovereigns throughout Europe. On the technical aspect of revolutions in the science of politics, consult: Locke,

Essay on Government: Burgess, Political Science and Comparative Constitutional Law (2 vols., Boston, 1896). On its historical aspects, see the history of different nations. See also Lilly, *A Century of Revolution* (London, 1890).

REVOLUTIONARY TRIBUNAL. The name given to the court for the trial of political offenses instituted by the French Convention on the night of March 10, 1793. The name was proposed by Cambacérès. Danton and his associates considered that such a court had become necessary, inasmuch as the disasters which had befallen the national armies on the frontiers had led to dangerous conspiracies against the revolutionary Government. Its members were chosen from the various departments, and their appointment was ratified by the Convention. Their function was to sit in judgment on all persons accused of crimes against the State, and from their sentence, delivered with appalling promptitude, there was no appeal. During the Reign of Terror, when Fouquier-Tinville (q.v.) was the public prosecutor, this tribunal acquired a fearful notoriety by doing away with almost all forms of justice, and making itself the willing instrument of the Committee of Public Safety. After several changes in organization, the Revolutionary Tribunal was finally abolished, May 31, 1795. See FRENCH REVOLUTION.

REVOLUTIONARY WAR. See UNITED STATES.

REVOLVER, MILITARY. The military revolver is a weapon of much disputed value, as is shown by its varying relative importance in the armies of the world. It has, perhaps, found a greater sphere of usefulness in the United States cavalry than with any other troops in the world. The ordinary range of usefulness of the service revolver—if judged by the sighting of those now in general use—is practically limited to 50 yards, the weapon itself being required to be strong enough to stop a man, and if possible a horse. The responsible authorities of the great military powers remain officially faithful to revolvers of over .40 calibre, and bullets of from 180 to 313 grains; although their officers are often supplied, or supply themselves, with lighter and less bulky weapons of reduced calibre. This is especially true of British officers. The United States Colt, calibre .38, fires a bullet lighter by nearly 30 grains than that of any other power, with the exception of those used by the Swiss dismounted officers, French officers, and the revolvers of the new Russian model. Its cylinder contains six chambers, and in order to facilitate the loading of cartridges and the simultaneous ejection of the emptied shells the cylinder is mounted upon a frame pivoted in the frame below the cylinder, so that on drawing the cylinder latch to the rear the cylinder swings to the left and downward out of its seat in the frame. Thus, all the chambers are exposed for loading, while the pressure against the end of the ejector rod under the barrel forces out the shells. This done, the cylinder is returned to its position in the frame and is automatically secured by the cylinder latch. One of the most important American revolvers is the *Smith and Wesson*. Formerly, Smith and Wesson revolvers were constructed in calibres from .22 to .45, but about the year 1890 the .22 calibre was discon-

tinued. These revolvers are equipped with an automatic shell ejector, so that when the revolver is opened by its clasp the barrel and cylinders tip downward, an action which simultaneously ejects the empty shells. This mechanism is one of the most important inventions ever made in connection with revolvers, and has been adopted by practically all the revolver manufacturers throughout the world, since the patents covering the invention expired. The Army Model Number 3, made by Smith and Wesson, weighs 2½ pounds, is central fire, with a calibre of .44. It takes six cartridges and has a length of barrel of 6½ inches.

All American pistols and revolvers use metallic cartridges. Although it is conceded that if loaded a certain way the breech-loading revolver has no advantage over the muzzle-loader, and even though it is admitted that the muzzle-loading pistol charged as are dueling pistols gives better results than a breech-loading pistol of the same weight, length of barrel, and bore, loaded with a factory metallic cartridge, yet, owing to the great amount of labor necessary to load them, they are, as a rule, unpopular with pistol-shots, and naturally are out of the question for military purposes. The mark IV, .445 service model revolver of the Webley and Scott Revolver Company was adopted in 1893 by a joint War Office and Admiralty committee for the exclusive use of the British Army and Navy, as well as the Indian and Colonial forces. It weighs 2 pounds 3 ounces, and has a 4-inch barrel. The cylinder may be locked or free as desired, a good feature of the weapon being its combination of the trigger action with the cocking action. As already stated, the British officer selects and purchases his own weapon, and since the advent of the automatic pistol a general need was felt for a revolver which should be capable of approaching the rapidity of fire of the automatic pistol. Since 1901 the Webley-Fosbery revolver has made its appearance, and has the great advantage of taking the regular service ammunition. See PISTOL; and Plate of PISTOLS AND REVOLVERS.

REVUE DES DEUX MONDES, re-vu' də də mōnd (Fr., Review of the two Worlds). The most important French magazine, founded in 1831 by F. Buloz, and now conducted by Brunetière. It is a bi-monthly and numbers among its contributors the leading French writers in literature, art, politics, and history.

REWA KANTHA, rā'wā kām'thā. A collection of 61 native States, constituting a British political agency, in the Gujarat division of Bombay, India. The combined area is 4980 square miles, and the population in 1901 was 478,889 having fallen off from 733,506 in 1891.

REWARD (OF, *rewarder, rewarder, rewarder, rewarder, rewarder, rewarder*, to regard, from *re-*, back + *warder, garder*, to watch, mark, heed, guard, from OHG. *wartōn*, Ger. *warten*, AS. *wærdian*, Eng. *ward*; connected ultimately with Gk. *ῥᾶν, ῥοῦν*, to see). A compensation or premium offered by a government or a private individual to the public in general for the performance of a particular act specified therein. In England, statutes forbid the offering or receiving of a reward for the return of stolen property under conditions protecting or sheltering the thief. In the United States compounding a felony is a crime, but the English

statute prohibiting the receiving back of property believed to have been stolen, without investigation, is not generally followed. The offer of a reward may be made verbally, by writing, or in the newspapers, and when made to the public indefinitely, may be accepted by any one who may see the offer. The various States differ as to whether one performing the service without having seen the offer is entitled to the reward. Where the offer of a reward is made in the newspapers, it may be withdrawn or revoked in the same way, and one who saw the offer, but did not see the revocation and performed the service called for, is not entitled to recover. The general principles of contracts govern, and the performance of the service requested completes a unilateral contract, on which an action can be maintained. One who goes to great trouble and expense to get the desired information, but does not succeed in doing so until after the offer is revoked, is without remedy. A police officer cannot recover a reward offered for the detection of a criminal, if his efforts were in the line of his duties; but if his services were not in any sense official, and were performed in his leisure time, he may claim such a reward just as any other individual could do. Consult the authorities referred to under CONTRACT.

REWARI, or RIWARI, rē'wā-rē'. The chief commercial town of the District of Gurgaon, Punjab, British India, 48 miles southwest of Delhi, at the junction of two railways (Map: India, C 3). It has a fine town hall, handsome Jain temples, and the interesting ruins of the fort of Gokulgarh. It is an important grain-distributing centre; sugar and salt are also exported, and great quantities of iron are imported for manufacturing purposes. Rewari dates from about B.C. 1000, when it was built near the site of an older town, ruins of which exist on the east. Population, in 1891, 27,900; in 1901, 27,300.

REWBELL, rē'bēl', JEAN FRANÇOIS (1747-1807). A French politician, born at Colmar, Alsace. He practiced law, became president of the corporation of advocates, was elected as a Deputy of the Third Estate to the States-General for the District of Colmar, and in the National Assembly became known for his knowledge of jurisprudence, his bold Republicanism, and his denunciations of Royalist conspiracies. In 1791 he became president of the Assembly, afterwards was general secretary to the directory of Haut-Rhin, and in 1792 was elected to the Convention. He was an opponent of the Jacobin Club, to whose suppression in November, 1794, he greatly contributed; was a member of the Committee of Public Safety and was elected to the Council of Five Hundred. In November of 1795 he became a member of the Directory, in which he exercised great influence on matters of finance and justice. He was elected president of the Directory in 1796, and was chosen by lot to retire in May, 1799. He sat in the Council of Ancients, but after the coup d'état of the Eighteenth Brumaire (November 9, 1799) withdrew from public life. Consult the standard works on the French Revolution, and Sciout, *Le Directoire* (4 vols., Paris, 1895-97).

REYBAUD, rē'bō', LOUIS (1799-1879). A French author and politician, born at Marseilles. He entered journalistic work, and settled in Paris

in 1820. Besides editing a *Histoire scientifique et militaire de l'expédition française en Egypte* (10 vols., 1830-36), he published *Études sur les réformateurs ou socialistes modernes* (1840), which won the Montyon prize; a satirical romance, entitled *Jérôme Paturot à la recherche d'une position sociale* (1843); and a satire on Revolutionary Wars, *Jérôme Paturot à la recherche de la véritable des républicains* (1848).

REYER, rā'yā', LOUIS LOUÏS ERNEST (1823-). A composer of the modern French school. His real name was Rey. He was educated in the municipal schools. In 1850 he produced *Le Schœn*, a symphonic ode with chorus, set to a poem by Théophile Gautier. Several operas followed, one of the most conspicuously successful being *La Statue* (1861). He was elected to the Académie in 1876, and about the same time succeeded Bizet as librarian at the Paris Opéra. Mean while he gained considerable reputation as a feuilletoniste on the *Journal des Débats*, and through his essays published in 1875 under the collective title of *Votes de musique*. In 1862 he was made a chevalier of the Legion of Honor, and he became an officer of that order in 1886. His compositions include: operas, *Mutro Wolfraim* (1854), *Sacountala* (1858), *Erostrate* (1862), *Sigurd* (1884), *Salammô* (1890); cantatas, *Victoire* (1859), *L'Union des arts* (1862), *L'Hymne du Rhin*; and male choruses.

REYKJAVIK, rē'kyā-vēk'. The capital of Iceland, situated on the southwest coast of the island at the head of the Faxa Fjörd (Map: Denmark, F 1). It consists chiefly of wooden houses, and has a small cathedral, a classical college, a theological seminary, and a medical school. In the house of the Althing are a library and a collection of Icelandic antiquities. During the summer there is steam communication with Copenhagen. Population, in 1901, 6682.

REYNARD (rā'nōrd) THE FOX. The greatest mediæval beast epic, in which animals become the mouth-pieces of human society. Versions of this epic are found in the chief languages of Western Europe. The narrative is made up of stories derived from European folk-lore and of more or less literary survivals of the Æsopic fable. Though the first extant signs of the epic date back to 940 (*Echasis Captivi*), the various elements of the tale did not group themselves into a whole until the twelfth century. In the Latin *Isengrimus*, which is, however, mainly of literary origin, the animals already have specific names. The principal character is Reynard (from the Germanic Raginohard, meaning 'the wily, the crafty one')—the fox, whose deadly enemy is Isgrim (probably German *eson* and *grum*, signifying 'strength,' 'endurance') the wolf. About these two and their bitter feud are found grouped: Noble the lion, Bruin the bear, Tibert the cat, Baldwin the ass, Chanticleer the cock, Kyward the hare, etc. The fact that *Isengrim* was used in 1112 as the epithet of a man (one of the conspirators against Gaudry, Bishop of Laon) shows that the tale was popularly current at an early date. The French *Roman de Renard*, a lost version of which was probably the source of most of the other European versions, is a cycle of episodes in octosyllabic verse, compiled by various authors at various epochs. The narrative is there divided into 'branches,' thirty in number,

work together constitute over 30,000 verses. The manuscript of this compilation is of the thirteenth century, but we have a German poem of the twelfth century, modeled on an earlier version of the same French work. Various 'trouvères' attempted to give shape to this material, though the romance never attained genuine unity. The names of three alone of these compilers have been handed down: Pierre de Saint Clouf, Richard de Liou, and a clerk who called himself *Prestre de la Croix au Bric*. These names indicate that the Ile de France, Champagne, Normandy, and Flanders are the localities where the various parts of the poem took shape. The gist of the tale, in this completed form, is that the Fox has given offense to the Wolf and to several other animals, for which reason he is called before the court of justice held by the Lion. At first he refuses to come and through trickery rids himself of those sent after him. Finally, when forced to appear, he pretends repentance and is pardoned by the Lion. The offense, however, is repeated in a different form and again the Fox goes free. At last the Wolf in despair challenges him to single combat. Here again the craft of the Fox gains a complete victory, which ends in his being recognized as the real master of beasts.

In the fourteenth century the story was again taken up and given a number of remodelings on French soil; chief among these are *Renart le Nouvel*, by Jacquemard Geleé, and the famous *Renart le Contrefait*, by an unknown clerk of Troyes. Here the romance has become a veritable compendium of moral, historical, and political ideas expounded by Reynard in conversation.

The romance was very popular in foreign lands. It was translated into Middle High German in 1180 by the minnesinger Heinrich der Glîches' re; it was imitated in Catalonia by Raymond Lulle and given an English form (published by Caxton) and a Flemish form. Goethe modernized the German version in his *Reinecke Fuchs* (translated by T. J. Arnold). Mediæval art delighted in depicting scenes from the *Renard*.

For a detailed bibliography, consult: Ernest Martin, *Le roman de Renart* (Strassburg-Paris, 1882-87), and Potvin, *Le roman du Renard* (Paris, 1891). The best edition of the French version is that of Martin, *op. cit.*; the German *Reinhart Fuchs* is edited by Reissinger (Halle, 1886), the Flemish verse version *Reinart de Vos*, by Van Helten (Groningen, 1887), and Caxton's English version is edited by Thoms. Percy Society (London, 1844). For questions of sources, etc., consult: Sudre, *Les sources du roman de Renart* (Paris, 1893); id., in Petit de Julleville, *Histoire de la langue et de la littérature française*, vol. ii. (Paris, 1896); G. Paris, *Le roman de Renard* (ib., 1895); F. S. Ellis, *History of Reynard the Fox* (London, 1894); and T. Jacobs, *Reynard the Fox* (ib., 1895).

REYNAUD, ré-nô', JEAN ERNEST (1806-63). A French philosopher and author, born at Lyons. He was at first a mining engineer, but came into public notice as an opponent of Saint-Simonism, his previous creed, in a series of articles in the *Revue encyclopédique*. His chief work, *Terre et ciel* (1854), is a résumé of the ideas he had already set forth in the *Encyclopédie nouvelle*, which he and M. Pierre Leroux had founded in 1835, and he published also *Minéralogie des gens du monde*

(1834); *Considérations sur l'esprit de la Gaule* (1847); *Vie et correspondance de Merlin de Thionville* (1860); and *Etudes encyclopédiques* (1866).

REYNOLDS, ré-nôldz, GEORGE WILLIAM MAC-ARTHUR (1814-79). An English politician and author. He was educated at the Royal Military College at Sandhurst (1828-30). Disliking the prospect of a military career, he left before completing his studies and traveled on the Continent, acquiring a wide knowledge of the most modern French literature. *The Youthful Impastor* (1835), his first novel, was followed by a volume of translations from Hugo (1836), and by two volumes of essays entitled *Modern Literature of France* (1839). In 1846 he became editor of the *London Journal*, for which he wrote *The Mysteries of London* in imitation of Eugène Sue's *Mysteries of Paris*. In the same year he started *Reynolds's Miscellany*, to which he contributed during the twenty-three years of its life many sensational tales. He took a leading part in the Chartist movement and was one of the last to abandon its cause. In 1850 he started the still existing *Reynolds's Weekly Newspaper*, an organ of the laboring classes.

REYNOLDS, HENRY ROBERT (1825-96). An English Congregational minister, born at Romsey, Hampshire. He studied at Coward College and at the London University (1841), and five years afterwards was ordained to the charge of a church at Halstead, Essex, but continued his studies, and graduated in 1848. His second pastorate was in Leeds (1849), with intervals of Continental travel until he became president of Cheshunt College (1860-94). He was associate editor of the *British Quarterly Review* in 1866-74, edited the *Evangelical Magazine* in 1877-82, and published: *The Philosophy of Prayer* (1881); *Buddhism* (1886); and *Athanasius* (1889).

REYNOLDS, JAMES EMERSON (1844—). An Irish chemist, born in Booterstown, County Dublin, and educated at Dublin University. He was chosen professor of chemistry to the Royal Dublin Society in 1870, to the Royal Irish College of Surgeons in 1873, and in Dublin University in 1875. Reynolds discovered thiocarbamide and many other compounds of the same class, and published *Lectures on Experimental Chemistry* (1874) and *General Experimental Chemistry* (1880).

REYNOLDS, JOHN. See RAINOLDS, JOHN.

REYNOLDS, JOHN FULTON (1820-63). An American soldier, born at Lancaster, Pa. He graduated at West Point in 1841, was assigned as brevet lieutenant to the artillery, and during the Mexican War participated in the defense of Fort Brown and the battles of Monterey and Buena Vista. At the outbreak of the Civil War he was commandant at West Point. He was commissioned brigadier-general of volunteers in August, 1861, and was given a brigade of the Pennsylvania Reserve Corps before Washington. The next year he took part in both the Peninsula and Northern Virginia campaigns, and during the succeeding Maryland campaign commanded the Pennsylvania Volunteer Militia for the defense of his native State. In November he was given the command of the First Corps of the Army of the Potomac and was promoted to be major-general of volunteers. He took part in Meade's at-

taek on the Confederate left at Fredericksburg, and at Gettysburg arrived on the field about two hours after the fighting had begun on the first day of the battle and was in chief command on the field until late in the morning (July 1861), when he was shot and instantly killed by a Confederate sharpshooter.

REYNOLDS, JOHN HAMILTON (1796-1852). An English poet, born at Shrewsbury, Shropshire. After a secondary education, he entered in a minor capacity an insurance office, and in 1811 published two books of verse, *Safe, an Eastern Tale*, inscribed to and qualifiedly praised by Byron, of whose manner it was a frank imitation; and *The Eden of Imagination*, in the style of Wordsworth and Hunt. In 1818 he obtained a post in a solicitor's office, and in the year following published a moderately skillful parody of Wordsworth's style a poem called *Peter Bell* (thus antedating the actual publication of Wordsworth's poem of the name). He was at one time a proprietor of the *Albion*, and about 1838 removed to the Isle of Wight, where he was clerk of the county court. His best work is to be found in *The Garden of Florence, and Other Poems* (1821).

REYNOLDS, JOSEPH JONES (1822-99). An American soldier, born at Flemingsburg, Ky. He graduated at West Point in 1843, was brevetted second lieutenant of artillery, and from 1846 to 1855 was a member of the faculty at the Military Academy. In 1857 he resigned and became professor of mechanics and engineering at Washington University, Saint Louis, but three years later gave up this position to become a merchant at Lafayette, Ind. At the outbreak of the Civil War he entered the Federal service as colonel of the Tenth Indiana Volunteers and a month later was commissioned brigadier-general of United States Volunteers. In January, 1862, he again resigned, in August was again commissioned colonel, and in September was again promoted to brigadier-general. In November he was advanced to be major-general, and in 1863 participated in the battles of Chickamauga and Chattanooga. From January 6 to June 16, 1864, he commanded the defenses of New Orleans. He was mustered out of the volunteer service in 1866, and was reappointed colonel of the Twenty-sixth Regular Infantry. A year later he was brevetted major-general and in 1877 retired from active service.

REYNOLDS, Sir JOSHUA (1723-92). The most celebrated English portrait painter. He was born at Plympton, Devonshire, July 16, 1723. His father was the Rev. Samuel Reynolds, rector of the grammar school. He intended his son for the medical profession, but Joshua, having manifested from an early age an ardent desire to be a painter, was, in 1741, placed under Hudson, the principal portrait painter of the day. After being in the studio of this artist two years he commenced on his own account as a portrait painter at Plymouth Dock, now Devonport, and met with great encouragement. In 1745 he went to London and established himself in Saint Martin's Lane; but on the death of his father in 1746 he returned to Plymouth Dock. Upon the invitation of Commodore Keppel, who was in command of the Mediterranean squadron, he sailed for Italy from Plymouth in 1749, and on his arrival in Leghorn,

proceeded to Rome. He stayed about three years in Italy, most diligently employing his time in visiting the various cities where the chief art collections are to be found. Upon his return to London in 1752 his works attracted great attention, eclipsing everything that had been done there since Van Dyck's time. When the Royal Academy was instituted in 1768 he was elected president; he was knighted by George III., and on Ramsay's death in 1781 succeeded him as painter to the King. He founded the Literary Club (1764) for Dr. Johnson's benefit. To him Goldsmith dedicated his *Deserted Village*. He died in his palatial house in Leicester Square on February 23, 1792, and after lying in state at the Royal Academy, was interred in the crypt of Saint Paul's.

Sir Joshua was very prominent in the social world and lived in friendly intercourse with Johnson, Burke, Goldsmith, Gibbon, Garrick, and other leading men of his period. His principal literary works consist of fifteen *Discourses Before the Royal Academy* (1778), treatises on the history of art of a high critical and artistic value. They are written in a precise, good style, and inculcate those maxims of art commonly known as academic.

The formative influence in Reynolds's art was the great Italian masters, especially the Venetians, Correggio, the Bolognese Eclectics, and Michelangelo. He was much of an eclectic himself, and there was little that was strikingly original about his work. His composition and brush work were learned, but his drawing, especially of the limbs, was often faulty. The strong point of his paintings was their color, showing the influence of Titian; but Sir Joshua's technical experiments had a disastrous result upon their preservation. His portraits are admirable realistic representations; the men are strong in action and character, the women gentle and pure, the children innocent and natural. They form an epitome of London society of his day.

He is estimated to have painted from two to three thousand portraits, most of which are in English private collections. The National Gallery, however, possesses a number of his best works, including those of Admiral Keppel, Lord Heathfield, the Hero of Gibraltar, Goldsmith, Dr. Johnson, Garrick, the members of the Dilettante Society, and three portraits of himself. The National Portrait Gallery (London) and the Royal Academy are rich in his works, as are also the London private galleries and the University of Oxford. Especially worthy of mention are the portraits of Lady Cockburn and her children, the Duchess of Devonshire (Devonshire House), Nelly O'Brien (Herford House), and "Mrs. Siddons as the Tragic Muse" (Dulwich Gallery).

Although Sir Joshua preferred historical painting, his works of this character are less important. There are good examples in the Hermitage Collection, Saint Petersburg, including the "Coffin of Scipio"; the best, perhaps, is "Eugene and His Sons in the Tower." Among his few genre pictures are the "Girl with the Mouse-trap" (Holland House), and the "Strawberry Girl." His beautiful and well-known "Angels' Heads" (National Gallery) are in reality portrait studies. There are also good examples of Reynolds's work in the principal American collections.

BIBLIOGRAPHY. The older biographies of Rey-

nolds, the of Malone (1798), Northcote (1813), Barrington (1819), Beeche (1835), and Cotton (1846), have been superseded by the comprehensive *Lep.* by Tom Taylor (London, 1865), which also includes the researches of Leslie. Other good biographies are those of Chesnan (Paris, 1887), Phillips (London, 1893), and Gower (ib., 1902).

REZONVILLE, *ῥεζόνβιλ*. A village of German Lotharing, 10 miles west-southwest of Metz and 2 miles southwest of Gravelotte. The battle of Gravelotte (q.v.) is sometimes called the battle of Rezonville.

RHACHITIS, *ῥάκπιτις*. See RICKETS.

RHAD'AMAN'THUS (Lat., from Gk. *Ῥαδάμανθος*). In Greek legend, a son of Zeus and Europa, and brother of Minos (q.v.). In Homer and the older epic, Rhadamanthus is a hero, who by special favor of the gods has been translated, with others, to Elysium or the Islands of the Blessed. In later story these islands become the kingdom of Cronos and the released Titans, and Rhadamanthus, married to Alcmene, mother of Hercules, holds high rank and sits as judge. Another conception of the other world prevailed later, in which Rhadamanthus, with Minos, Eacus, and Triptolemus, because of their justice in this life, sit in judgment on the souls of the dead, and assign them their due meed of bliss or punishment.

RHADAMES, *ῥαδάμαξ*. An oasis and town in North Africa. See GADAMES.

RHÆTIA, *ῥῆσιᾶ*, or better, **RÆTIA**. A Roman province lying in the Alps, north of Italy and east of Helvetia, and bounded north by Germany and east by Noricum, thus embracing the Grisons and part of Tyrol. It was watered by the Rhine, Athesis (Adige), and Enus (Inn). The natives were chiefly engaged in herding sheep and cattle. They were a hardy and warlike race, but were conquered about B.C. 15 by the Romans under Tiberius and Drusus. Later Vindelicia, to the north, was united with Rætia. The chief town of Rætia proper was Tridentum (Trent); and of Vindelicia, Augusta Vindelicorum (Augsburg).

RHÆTIC BEDS. A series of strata forming the uppermost portion of the Triassic system, which is extensively developed in the Rætian Alps.

RHAMNACEÆ (Neo-Lat. nom. pl., from Lat. *rhamnus*, from Gk. *ῥαμνος*, buckthorn, Christ's-thorn), BUCKTHORN FAMILY. A natural order of about 40 genera and 500 species of dicotyledonous, often spiny trees or shrubs, natives of and widely distributed in temperate and tropical countries. They have simple leaves; small, generally green flowers; and either fleshy fruit, not opening when ripe, or dry and separating into three parts. Some species have been used in dyeing (buckthorn), some in medicine (red root), and the fruit of some for food. (See LABRÆ.) The sweet red pulp of the thickened flower stalks of *Hovenia dulcis*, a native of China and Japan, is edible; in flavor they resemble the pear. The chief genera are *Rhamnus*, *Ceanothus*, *Zizyphus*, *Hovenia*, *Phytlica*, and *Gouania*.

RHAMNUS. A genus of shrubs and trees. See BUCKTHORN.

RHAMPHORHYNCHUS, *ῥάμφορῖνχῦς* (Neo-Lat., from Gk. *ῥαμφορ*, *rhamphos*, curved

beak + *ῥίγχορ*, *rhyngchos*, snout). A fossil flying reptile of Upper Jurassic age. See PTERODACTYL.

RHAMPHOSUCHUS, *ῥάμφοσῦχος* (Neo-Lat., from Gk. *ῥαμφορ*, *rhamphos*, curved beak + *σῦχος*, *souchos*, crocodile). One of the largest fossil crocodiles, known by fragmentary bones found in the Pliocene deposits of the Siwalik hills of India. The animal must have attained a length over all of about 50 feet.

RHAMPSINITUS (Lat., from Gk. *Ῥάμψινοιτος*). A King of Egypt, the subject of a remarkable tale related by Herodotus. According to the Greek historian, Rhampsinitus possessed enormous wealth, and wishing to store it securely, caused a treasure house of stone to be built. The architect who constructed the building left a secret entrance concealed by a movable stone, and on his death bed informed his two sons of the fact. The sons repeatedly entered the treasury, and each time carried away as much of the treasure as they were able. Finally, the elder brother falls into a trap set by the King, and the younger brother, at his request, cuts off and carries away his head that he may not be recognized. The headless body is exposed, guarded by soldiers, but the younger brother, by a clever stratagem, makes them drunk and obtains possession of it. The King then attempts to capture the thief by the aid of his daughter, who is ordered to receive all who desire to visit her, promising her love to him who can relate the most remarkable adventure experienced by himself. The thief visits the princess and tells her the story of the theft, but when she attempts to seize him he slips into her hands his dead brother's arm, which he has brought under his cloak, and makes his escape. Thereupon the King, admiring his cleverness, grants him immunity for his theft, and gives him his daughter in marriage. Rhampsinitus is to be identified with Rameses III., whose treasury at Medinet Habu is the building referred to in the story of the thief. The accounts of Herodotus are derived from the popular tales and legends which, in his time, were current in Egypt.

Consult: Herodotus, ii., 121-124; Wilkinson, *Manners and Customs of the Ancient Egyptians* (London, 1878); Clouston, *Popular Tales and Fictions* (Edinburgh, 1887); Budge, *A History of Egypt* (New York, 1902).

RHAPSODISTS (from Gk. *ῥαψοδός*, *rhapsōdos*, bard, from *ῥάπτειν*, *rhaptein*, to stitch together + *ὄδῃ*, *ōdē*, song, from *ἄδειν*, *adein*, to sing). A name applied in ancient Greece to professional reciters of poetry, and especially to a class of wandering minstrels who recited the Homeric poems. So long as the Homeric lays were handed down by oral transmission, the rhapsodists were a highly respected class, and there can be little doubt that they often exercised a considerable influence upon the text of the poems. But with the commission of the poems to writing and the circulation of manuscript copies, the character of the rhapsodists gradually changed, so that in the fourth century they are represented as stupid persons, with nothing to commend them but a retentive memory. Their recitations, however, continued to be popular until a comparatively late period. The rhapsodist carried a staff, and when reciting wore a crown as a mark of his office. He did not confine himself to mere recitation, but commented upon the poet's meaning and discussed questions of interpretation.

Each recitation was known as a 'rhapsody,' and hence this term is often applied to the separate books of the *Iliad* and the *Odyssey*. The most important source of information concerning the rhapsodists is Plato's *Ion*.

RHAPSODY (Lat. *rhapsodia*, from Gk. *ῥαψωδία*, recital of poetry, portion of an epic recited at one time, from *ῥαψωδός*, *rhapsōdos*, bard). A term in modern music, applied to an instrumental composition written in the form of a fantasia usually upon folk-songs or national melodies. The rhapsodies of Raff and Lalo, and especially the Hungarian rhapsodies of Liszt, have become famous.

RHATANY (Brazilian, Port. *ratanhia*, from Quichua *ratuna*, the native name), or RATTANY, *Krameria triandra* and *Krameria Lima*. Half-shrubby plants of the natural order Polygalaceæ, natives of the cold sterile tablelands of the Andes in Peru and Bolivia. Their roots have been used medicinally as an astringent and tonic. When powdered and mixed with orris root or charcoal the roots are used as a tooth-powder. Rhatany root is exported chiefly from Lima, Peru. It is extensively employed in Portugal to color wines, the coloring matter in the roots being known as rhatanic acid.

RHA'ZES. The Latin name of ABU BEKR MOHAMMED IBN ZAKARIYA AL-RAZI. The most important of the mediæval Mohammedan physicians. He was born about the middle of the ninth century in the Persian city of Rai. Up to his thirtieth year he devoted himself to music, and then took up the study of medicine at Bagdad. He became the head of a hospital at his native place and later at Bagdad. After his reputation was made he traveled, visiting different courts. He died either in 923 or 932. Much of Rhazes's knowledge was drawn from Greek sources, but he was more than a mere borrower and is famed as the first to describe smallpox and measles (in his book *Al-jardari wal-hasba*, several times translated into Latin, and into English by Greenhill, London, 1848). He is said to have written more than two hundred works; the most famous was the *Kitâb al-tibb al-Mansûri*, a general treatise on medicine in 10 books. The *Kitâb al-hûri* (*liber continens*), a cyclopædia of medicine, was edited from his papers after his death. Both these works were translated into Latin in the fifteenth century. Consult: Wüstenfeld, *Geschichte der arabischen Aerzte und Naturforscher* (Göttingen, 1840); Leclere, *Histoire de la médecine arabe* (Paris, 1876).

RHEA (Lat., from Gk. *Ῥέα*). A Greek goddess representing the productivity of nature and anciently identified with Cybele. She was the daughter of Uranus and Gæa, wife of her brother Cronus, and mother of Zeus, Hades, Poseidon, Hera, Hestia, and Demeter. She had an ancient place of worship in Crete, where she gave birth to Zeus on Mount Ida.

RHEA, or **REA SILVIA**. In Roman tradition, a Vestal virgin, the daughter of the Alban Numitor, and mother of Romulus and Remus, by Mars. When Amulius usurped the throne, the infants were exposed and Rhea Silvia was condemned to be buried alive for breaking the vow of chastity required of the Vestals. She was also called Ilia.

RHEA (Lat., from Gk. *Ῥέα*, daughter of Uranus, and Gæa). The generic and English name of a family of South American ratite birds allied to the ostrich, in which they differ in having the feet three-toed, and each toe armed with a claw, also in being more completely feathered on the head and neck, in having no tail; and in having the wings better developed and plumed, and terminated by a hooked spur. The wings are, indeed, more efficient than in any other of the Ratite, although unfit for flight.

Rheas are known to Brazilians as 'ema' and to Argentines as 'mandu,' 'ayastruz,' or 'chunco.' There are two species, of which the best known (*Rhea Americana*) is considerably smaller than the ostrich, standing about three feet high. It is uniform gray, except on the back, which has a brown tint. The male is larger and darker

SAME (*Rhea Americana*).

colored than the female. The back and rump are furnished with long feathers, much inferior to those of the ostrich in beauty as plumes, but marketable as material for dust brooms and the like. The skins are made up into rugs, of which large numbers are fabricated in the neighborhood of Mendoza, Argentina. The rhea inhabits the great grassy plains of South America, southward of the equator, and abounds on the banks of the La Plata and its more southern tributaries. It is generally seen in small groups, usually associated with guanacos, and eating grass, seeds, berries (especially of *Eupetrum*), worms, snails, and almost anything else it can swallow. It runs with great celerity, using its wings in aid. It is polygamous, one male securing possession of two or more females, which lay their eggs together in a mere hollow, where, when 20 or 30 are gathered, they are incubated by the cock.

A smaller and more recently discovered species (*Rhea Darwinii*) has light brown plumage, each feather tipped with white. It inhabits Patagonia, and extends northward along the base of the Andes to the edge of Peru, and differs from the other in many particulars. A third species has been catalogued, but it is now considered a dark, local race (variety *Macrorhynchus*) in Northeastern Brazil of the ordinary mandu.

Excellent portraits and descriptions of the Rheims series may be found in the *Transactions of the Zoological Society of London*, vol. iv, p. 22. Consult also: Darwin, *A Naturalist's Voyage* (London, 1860); Selater and Hudson, *Vegetative Ornithology* (ib., 1889).

RHEA, or **RAMIE**, **FIBRE**. See **RAMIE**.

RHEGIUM, rō'ji-nm. The ancient name of a city of Magna Græcia, Italy, now known as Reggio di Calabria (q.v.).

RHEGIUS, rē'ji-us (Latinized form of his family name, *Rheger*; the form *Regius*, as if from *König*, king, is incorrect). **URBANUS** (1489-1541). A Protestant Reformer. He was born at Lange-nargen, on Lake Constance, studied at Freiburg, and at first was professor of rhetoric and poetry at Ingolstadt; later he turned to theology, entered the priesthood of the Catholic Church, and became a doctor of theology at Basel. In 1520 his views underwent a change and while cathedral preacher at Augsburg he wrote satirical pieces against the Church and openly preached Lutheran views. In 1521 he was removed, but in 1524 was again preacher in Augsburg, and so remained till the diet held there in 1530. When the Emperor had silenced the evangelical preachers of the city, he entered the service of Ernest, Duke of Brunswick-Lüneburg, and removed to Celle, where he died. In the Eucharistic controversy he wavered, but finally decided for Lutheran views. His Latin works appeared at Nuremberg in 1561, three parts; his German in four parts, in 1562; again at Frankfurt, 1577. Of these works the best known are: *Formula Cante Loquendi* (1535; in German, 1536; last ed. by Steinmetz, Celle, 1880); *Dialogue con der trostlichen Predigt* (1537); a devotional work much read even in the seventeenth century; *De Restitutione Regni Israelitici* (1536; Ger. trans.); Consult his *Life* by Uhlhorn (Elberfeld, 1861); and Steitz, *Die Theologie des Urbanus Regius, speciell sein Verhältnis zu Luther und zu Zwingli, 1521-23* (Gotha, 1898).

RHEIDT, rit. A town of Prussia. See **RHEYDT**.

RHEIMS, or **REIMS**, rēmz, *Fr. pron.* rāns. The capital of an arrondissement in the Department of Marne, France, situated on the Vesle, 107 miles by rail east-northeast of Paris (Map: France, L. 2). The vine-clad Montagne de Rheims and adjacent hills rise on the south and west, and detached forts at various points surround the city. The mediæval ramparts have been replaced by tree-lined boulevards, but some of the ancient gateways have been preserved, of which the most noteworthy is the Porte de Paris. The town is well built, the material used being limestone, of the district, which, with the prevalence of the older style of domestic architecture, gives the place a picturesque appearance. There are many quaint old houses. The most striking public building is the thirteenth-century cathedral, which, although it still lacks the towers of the original design, is one of the finest extant specimens of Gothic architecture. It is 453 feet long. The elaborate west facade has 500 statues and a splendid rose window, and is flanked by two towers. Scarcely less beautiful is the north portal, with its sculptures. The cathedral is famous as the church in which the French kings were crowned. The eleventh-century Romanesque Abbey Church of Saint Remy is of nearly equal

size. Other interesting buildings are the hospital occupying the ancient Abbey of Saint Remy, the fifteenth-century archiepiscopal palace with a museum of sculpture, and a handsome hôtel-de-ville, begun in 1627, containing the public museum and library of over 80,000 volumes. The Porta Martis, a Roman relie, is a fine triple triumphal arch of the fourth century in a fair state of preservation. The chief modern educational institutions are the lyceum and a preparatory school of medicine and pharmacy. Rheims is one of the principal entrepôts for the wines of Champagne. It is a great centre of woollen manufactures.

Rheims is built on the site of *Durocororum*, or *Civitas Remorum*, the capital of the Remi. On the Montagne de Rheims, south of the city, are a number of Gallo-Roman remains. Under the Frank rule Rheims was a place of much importance, and it acquired a religious interest from its having been the scene of the baptism of Clovis and his chief officers by the Bishop, Saint Remy, in 496. In the eighth century it became the seat of an archbishopric, and from 1179, in which year Philip Augustus was solemnly crowned there, it was the place for the coronation of the kings of France down to the time of Charles X. The town suffered severely during the campaign of 1814, and on September 4, 1870, was occupied by the Germans. Population, in 1901, 108,385. Consult: Marlot, *Histoire de Reims* (Rheims, 1843-45); Justinus, *Reims, la ville des sacres* (Paris, 1860); Gosset, *Cathedrale de Reims* (ib., 1894).

RHEINBABEN, rīn'bā-ben, GEORG, Baron von (1855—). A Prussian statesman, born at Frankfort-on-the-Oder. He studied law and political science at Heidelberg and Berlin, became referendary at the district court at Erfurt, in 1877, government assessor in Schleswig, in 1882, was appointed to an assistant position in the Ministry of Finance in 1885, and promoted rapidly to higher offices until, in 1896, he became president of the Government board at Düsseldorf. Made Prussian Minister of State and Secretary of the Interior in 1899, he succeeded Miguel as Minister of Finance in 1901.

RHEINBERGER, rīn'bērk-ēr, JOSEPH (1839-1901). A German organist and composer, born in Vaduz, Liechtenstein. He received the greater part of his musical education at the Royal School of Music, Munich, where he subsequently taught the organ, counterpoint, and composition. He was organist of Saint Michael, conductor of the Oratorio Society, repertor at the Court Opera, and Court kapellmeister, and he was regarded as one of the greatest theory and organ teachers of his time. His music is essentially German in character, but somewhat too heavy to be popular. His organ sonatas and other compositions for that instrument are especial favorites in America. His compositions include: *Christophorus*, oratorio; *Toggenburg* and *Waldmorgen*, cantatas; *König Erich*, ballad for chorus with pianoforte; *Wittkind*, and *Das Thal des Espingo*, chorus; the *Wallenstein* and *Florentine* symphonies; overtures, pianoforte, chamber, organ, and orchestral music; and the operas *Die sieben Raben* (1896) and *Türmers Töchterlein*.

RHEINE, rī'ne. A town in the Province of Westphalia, Prussia, on the Ems, at the head

of navigation, 24 miles by rail north-northwest of Münster (Map; Germany, B 2). It is known principally for its manufactures of cotton, jute, linen, tobacco, and machinery. Population, in 1900, 10,371.

RHEINFELS, rînf'els. The largest and one of the most beautiful of the ruined castles on the Rhine. It was built in 1245 by the Count of Katzenelnbogen, one of the petty barons of the Rhine. In modern times it was a strong Hessian fortress. In 1794 the French gained possession of it and blew it up in 1797. It is now the property of the Emperor of Germany.

RHEINGOLD, rîng'gôlt, DAS. The first division of Richard Wagner's music drama *Der Ring des Nibelungen*. It was first given in Munich, September 22, 1869. See RING OF THE NIBELUNGEN.

RHEINHOLD, rînh'ôlt, HUGO (1853—). A German sculptor, born at Oberlahnstein, Hesse-Nassau. For several years he pursued a mercantile career in San Francisco and in Hamburg, before devoting himself to art in Berlin, under Max Kruse, and at the Academy under Herter, with signal success, as proved by his marble group, "By the Wayside," in the National Gallery, Berlin, and the large group in bronze, "Dynamite in the Service of Civilization," at the Nohelhof, Hamburg.

RHENANUS, râ-nâ'nus, BEATUS (1485-1547). A German classical scholar, whose real name was Bild von Rheinau. He was born at Schlettstadt, Alsace, and after studying at the University of Paris, spent most of his life in his native city. He was an intimate friend of Erasmus. His works, which show great critical acumen, include editions of *Plini Epistolæ* (1514); Tacitus (1519); Tertullian (1521); and Livius (with Gelenius, 1535), the *editio princeps* of *Villogus Paterculæ* (1522); and an historical work, *Rerum Germanicarum Libri Tres* (1531), which was considered the finest piece of historical research of his day. He was the first to question the authenticity of the *Dialogus* of Tacitus. Consult: Horawitz, *Beatus Rhenanus* (Vienna, 1872); *Des Beatus Rhenanus litterarische Thätigkeit* (ib., 1872); *Die Bibliothek und Korrespondenz des Beatus Rhenanus* (ib., 1874); and Knod, *Aus der Bibliothek des Beatus Rhenanus* (Leipzig, 1889).

RHENISH ARCHITECTURE. See ROMANESQUE ART, section *Germany*.

RHENISH CONFEDERATION. See CONFEDERATION OF THE RHINE.

RHENISH PRUSSIA. A province of Prussia. See RHINE PROVINCE.

RHENSE. A village of Prussia in the circle of Coblenz, on the Rhine, noted historically as the meeting-place of a diet, which, in July, 1338, during the struggle between the Emperors and the Papacy, took a firm stand for the former by declaring that whoever had received a majority of electoral votes was *ipso facto* German King and Holy Roman Emperor without further Papal confirmation.

RHEOTROPISM (from Gk. *ρῆν*, *rhein*, to flow + *τροπή*, *tropê*, turn). The imperfectly understood sensitiveness which enables plant organs, especially roots, to bend their tips either toward or away from the source of a

current of water in which they are placed. Negative rheotropic curvatures are often merely gross mechanical effects of the force of the stream. But positive curvatures (i.e. toward the source) are undoubtedly due to a specific reaction on the part of the organ. Positive rheotropism of roots, is exhibited well by seedlings of the radish, maize, and *Avena sativa*. To demonstrate this phenomenon seedlings with roots about 2 centimeters long need only to be affixed to the sides of an inclined wooden trough in which a current of water is flowing. In spite of the tendency of gravity and the force of the moving water to cause roots so immersed to grow downward, they will, after a few hours, bend up stream.

RHESUS (Lat., from Gk. *Ῥῆσος*). (1) A Bithynian river god, son of Oceanus and Tethys. (2) A Thracian ally of the Trojans, of whom the oracle declared that if his white horses should drink the waters of the Xanthus or feed on the grass of the plain of Troy, the city would not be taken. As soon as Rhesus in his journey reached the Trojan territory, he was surprised and slain in his camp by Odysseus and Diomedes, and his horses were carried off.

RHESUS (from Lat. *Rhesus*, Gk. *Ῥῆσος*, name of a river in the Troad, another in Bithynia, a King of Thrace, etc.). A small brown monkey (*Macacus rhesus*), common all over India. It is known as the Bengal monkey, or "bandar" of the Hindus. It moves about in large bands, ascending to the height of 8500 feet in the Himalayas, and is often protected and fed in the neighborhood of temples, by the Hindu priests, although not universally regarded as sacred. This monkey is one of those most familiar in menageries, where it may be recognized by the straightness of its moderately long hair, by the tapering tail, about one-half the length of the head and body, and by the nakedness of the buttocks, for some distance around the callosities. This is the monkey commonly carried about by Hindu jugglers, who teach it amusing tricks; and many stories are told of its superior intelligence. Compare MACAQUE.

RHETORIC (Lat. *rhetorica*, from Gk. *ῥητορική*, *rhêtorikê*, rhetorical art, fem. sg. of *ῥητορικός*, *rhêtorikos*, relating to an orator, from *ῥητορ*, *rhêtor*, orator; connected with *ῥημι*, *rhêmî*, to say, and ultimately with Eng. *word*). Taken broadly and philosophically, the science and art of communication in language, including all the processes and technical means by which, through language, the members of a community react one upon another. The general tendency of modern text-books has been to broaden the scope of rhetoric to include everything pertaining to the art of composition, and even to annex adjoining territories, such as poetics, and stylistic and literary criticism. But although rhetoricians are still far from agreement, the goal of recent thought is fairly well expressed in the definition here given.

Regarded from the scientific point of view, rhetoric properly belongs to that branch of knowledge which is concerned with the relations of men in society. The place and rationale of the science may be indicated as follows. In every community a great variety of activities go on simultaneously. One important group of

These activities consists of all the processes by which, through a variety of media, men express their thoughts and convey their thoughts and feelings to their fellows. This group may be called the expressive-communicative group of activities. It includes not only the more primitive modes of thought-conveyance, such as gesture, grimace, picture-writing, the histrionic dance, and the like, but also the most highly elaborated modes, such as the arts of architecture, sculpture, music, painting, and oral and written speech. This large class may be subdivided in two ways: (1) according to the medium employed in the process of thought conveyance, and (2) accordingly as the emphasis is thrown upon the individual or the social phase of the process. The first method of classification leads to the differentiation of the several arts; the second to the distinction of processes mainly self-expressive from processes mainly communicative. The subject matter of rhetoric is thus seen to be distinguished from that of allied sciences by the fact (1) that its medium is language, and (2) that the emphasis is thrown upon the phase of communication; that is, upon prose. The proper subject matter of the science may therefore be summed up in the phrase 'Expression in language for communication's sake,' just as the proper subject matter of poetics may be summed up in the phrase 'Communication in language for expression's sake.' But it should not be forgotten that although rhetoric is the science of communication, it is still concerned to a large extent with questions of expression.

If we regard rhetoric as it has been outlined above, its underlying problem is seen to concern the reciprocal speech relations of the individual and the community. Of this problem there are three principal phases, as follows:

I. *Psychological problems* relating (1) to the nature of the writing or speaking man, (2) to the mental activities involved in the process of composing. Here arise questions regarding (a) the nature and genesis of expression, (b) the characteristics of genius, (c) the acquirement and cultivation of the speech habit, and (d) the factors operating in the experience of the individual to turn his self-expression into the communicative channel. The first of these questions has been treated at some length by Darwin in his *Expression of the Emotions*, and by those who have sought to controvert him; the second, by Lombroso and others; and the third, by many recent psychologists. The fourth is as yet practically unexplored. It is obvious, however, to touch upon it briefly, that every successful writer or speaker is on one side receptive, on the other productive. As receptive he is a product of heredity and of the social environment. Through imitation of his fellows, this native impulse results in the acquirement of the resources of language, and the individual thus develops a writing or speaking personality. On the other hand, as productive, the writer exhibits the faculties of invention and social imagination. He creates by combining old ideas in new ways that suit better the needs of his contemporaries. He has a sympathetic imagination, which enables him to penetrate into the minds of his hearers, to read their desires, and to conceive how his words will act upon them. His expression is thus, in a sense, drawn from him, and shaped, by his keen realization of

the needs of his hearers. He produces in order to satisfy these needs.

II. *Social problems*, relating to the dynamic effect of speech upon the community of hearers or readers. The assumption which underlies discussion of the subject from this point of view is that language is preëminently the social bond—the connective tissue by which society is held together in organized forms. The main questions relate (1) to the typical modes of response on the part of individuals and groups of individuals in the community, (2) to the formation of social or public opinion. Dill, *Psychology of the Aggregate Mind of an Audience*, has endeavored to show that the minds of an assemblage listening to a powerful speaker undergo a curious process called 'fusion,' by which the members of the audience, losing their individual traits, are reduced, as it were, to a single individual, whose characteristics are those of an impulsive youth of twenty, imbued in general with high ideals, but lacking in reasoning power and will. But it is important here to distinguish, as Tarde has done (*L'Opinion et la foule*), between a 'crowd' and a 'public,' the associative principle of the former being physical, of the latter psychical. The rise of printing, which enables communication of the same matter simultaneously to persons widely separated in space, tends to the formation of a true public, which is not 'fused,' but can freely exercise both reason and volition.

III. *Formal problems*, relating to the medium of communication, namely, language, or, more precisely, discourse, that is, language in organized form. The main problems concern: (1) the nature and origin of discourse; (2) the peculiar function of discourse as (a) on one side, the expression of the individual, and (b) on the other side, the means of social interchange; (3) the structure or morphology of discourse in (a) its minuter forms (words, phrases, sentences, paragraphs, figures, rhythms), (b) its larger forms (whole compositions), (c) its typical modes (description, narrative, exposition, argument, persuasion); and (4) the typical methods of distribution (books, newspapers, conversation, etc.). The formal aspect of rhetoric has been developed in considerable detail in ancient and modern treatises, but has not been consistently unified or properly connected with the other two phases. It has been the practice of rhetoricians to make certain postulates of a formal character, such as the principle of unity in variety, of symmetry, or of purity, and upon these, by a process of deductive reasoning, to build a structure of theory. Of all the principles that have been advanced to explain the structural side of rhetoric, that of organic unity is perhaps most fundamental, and from it may be derived all of the usual rhetorical qualities. But the truth is that all such principles are derivative, not primary. A truly scientific exposition would demonstrate that the peculiar forms and qualities of any piece of discourse are the natural outcome of the interaction of the individual and society in the process of communication. An oration, for example, is the product of two forces, (1) the impulse of the individual to a certain kind of self-expression, and (2) the demand of the social mind for a certain kind of communication. The oration is the meeting point of these two forces. It is the path of least resistance traced by the language of the orator in adapt-

ing his utterance to the hearers' needs and desires.

RHETORIC, FIGURES OF. A term popularly applied to a large and heterogeneous class of language-forms, all characterized by the fact that they are deviations from what is plain, literal, and straightforward. From ancient times figures have been regarded by rhetoricians as 'embellishments' of speech; that is, as conscious devices and ornaments. Figures are commonly said to give life, strength, and beauty to style, but it would perhaps be truer to say that they have the power of arousing in the reader or hearer the same emotional and imaginative processes which gave birth to them in the mind of the writer.

Since the conceivable modes of departure from literal statement are almost infinite in number, it is obvious that an exhaustive enumeration of figures is difficult, and a classification of them well nigh impossible. The ancients, for whom the subject had a peculiar fascination, enumerated as many as 250 distinct species, and although modern writers, generally speaking, have been less prodigal in their invention, the *Arte of Poessie*, attributed to Puttenham (1589), names and defines 107. In recent text-books the tendency is to limit the number to 10 or 12. The important figures are as follows:

I. FIGURES OF IMAGERY. These are figures which arouse concrete images in the mind of the hearer. (a) *Metaphor* is a form of expression in which one object is made to appear under the image of another which it resembles in some particular. Thus in the sentence, "The ice makes daggers at the sharpen'd eaves," icicles are presented to us under the image of daggers, which resemble them in shape and color. Sometimes a metaphor contains two images which fail to blend, as in "With swift rapier-thrusts of irony, the prosecuting attorney applied the thumbscrews to the unwilling witness." Such figurative jumbles are called mixed metaphors. Akin to the metaphor, though distinct as being a legitimate development of semantics (q.v.), is *catachresis*, in which a word is extended in meaning beyond its strict sense, as "a silver drinking-horn." (b) An extended metaphor in narrative form is called *allegory*. Bunyan's *Pilgrim's Progress* is a famous example. A short, pointed allegory in which animals are represented as speaking and acting is called a fable. The brief allegories of the Bible are known as parables. (c) *Simile* differs from metaphor in that the resemblance between object and image which is assumed in metaphor is in the simile expressly stated by means of the word *like* or *as*. Thus "His face was a withered moon" is metaphor, but "All his face was white And colorless, and like the wither'd moon, Smote by the fresh beam of the springing east," is simile. (d) *Synecdoche* is a kind of metaphor in which the image is related to the object as a part to the whole, as the whole to a part, as genus to species, etc. Thus in "All hands on deck," *hands* is used for *men*. (e) In *metonymy* the image is an accompaniment of the object; that is, what contains it, stands for it, as, "The poorest man may in his cottage bid defiance to all the force of the Crown," *the Crown* standing for *the King*. Metonymy and synecdoche are, however, so nearly alike that the distinction is hardly worth preserving.

(f) FIGURES OF ARRANGEMENT. In these figures, words, phrases, clauses, or sentences are disposed in some peculiar and striking way to correspond to peculiar sequences of thought. (a) *Chiasm* consists in the arrangement of words, clauses, or sentences in the order of their importance, the least forcible coming first and the others rising in importance until the last; as in this example: "It is an outrage to bind a Roman citizen; it is a crime to scourge him; it is almost parricide to kill him; but to crucify him, what shall I say of this?" (b) *Antithesis* occurs when corresponding parts of a sentence are so juxtaposed as to give force to contrasting ideas; as, "To err is human, to forgive divine." Both climax and antithesis may appear also in the arrangement of the larger units of composition, as paragraphs and complete essays, as well as in the smaller units of words, clauses, and sentences.

III. FIGURES OF CONTRADICTION. In these figures there is an apparent contradiction between the form of expression and the idea to be expressed. (a) In *irony* the speaker's words seem to convey one meaning, but in reality convey just the contrary, the real meaning being suggested by the tone of the voice or the implication of the words. (b) *Epanora* is a brief, pointed sentence. Talleyrand's saying, "Language was given to man to conceal his thoughts," is a good example of epigram. (c) In *hyperbole* an object is greatly exaggerated in size or importance, for impression or humorous effect; as, "Swifter than the winds and the wings of the lightning." Hyperbole may also be looked upon as a kind of metaphor. Of the figures defined above, four—metaphor, metonymy, synecdoche, and irony—are often called 'tropes,' because in them a word is turned from its ordinary meaning or application. But the word is also applied to a figure of any kind expressed in a single word.

Among the figures which are less easy to classify may be mentioned the following: *Apophysis*, *paraleipsis*, or *omission* is the pretended omission or passing over of what one is really mentioning. *Apostrophe* is a turning aside to address an inanimate object, or a person not present. *Asyndeton* consists in the omission of connectives, as "I came, I saw, I conquered." *Epanorthosis* is an effective correction of something which has just been said, as "His fault—perhaps I should rather say his crime." *Epilepsis* is a figure in which a person seeks to move or persuade by means of gentle upbraiding. *Epilepsis* is a climax consisting of several clauses so framed that the last part of one clause is repeated as the beginning of the next, as "He not only spared his enemies, but continued them in employment; not only continued them, but even advanced them." *Epistrophe* is a figure by which successive clauses or sentences end with the same emphatic word or phrase, as "Are they Hebrews? So am I. Are they Israelites? So am I. Are they the seed of Abraham? So am I." *Euphemism* is the use of mild, softened language on unpleasant subjects, for the purpose of avoiding the directness of plain speech. *Interrogation* is the asking of questions, not to gain information, but to assert more emphatically the opposite of what is asked. *Litotes* is a figure in which the author denies one thing instead of directly affirming the opposite. *Onomatopœia* is the use of a word, phrase, or clause to imitate

the word of the thing signified as 'rat-fat-fat,' because of the *prosopopoeia* or *prosopopoeia* is the representation of inanimate objects as living beings. "Necessity is the mother of invention."

RHETT, *ret.* ROBERT BARNWELL. (1800-76). An American politician, born at Beaufort, S. C. His name was originally Smith, but after entering public life he changed it for that of a prominent colonial ancestor. He received a liberal education, studied law, and in 1826 became a member of the State Legislature. In 1832 he was elected Attorney General of the State, and during the Nullification agitation attracted wide attention by his radical advocacy of the theory of State's rights, in which he out-stripped Calhoun himself. In the fall of 1836 he was elected as a Democrat to Congress, sitting by reflection until 1849, and taking a leading part in the acrimonious slavery debates. In 1850 he was elected United States Senator to fill the vacancy caused by the death of John C. Calhoun and took his seat January 6, 1851. He at once took the most extreme position in regard to slavery, and stoutly opposed all compromises as only temporary expedients to put off for a short time the inevitable secession. In the heated campaign of the year 1852 he advocated the immediate withdrawal of South Carolina from the Union without consultation with other Southern States. The Union candidates were generally successful at the ensuing election. Rhett took the defeat as a personal rebuke, resigned his seat in the Senate, and retired to his plantation. In the *Charleston Mercury*, in which he purchased a controlling interest, he continued to advocate his extreme views, and in 1860 again came into prominence as one of the most radical members of the South Carolina convention which adopted the ordinance of secession, and was the author of its address to the people. In the Montgomery convention which met to organize a provisional government for the seceding States he was one of the most active delegates, and was chairman of the committee which reported the Confederate Constitution. Subsequently he was elected a member of the Lower House of the Confederate Congress. After the war he settled in Louisiana.

RHEUMATISM (Lat. *rheumatismus*, from Gk. *ῥευματισμός*, liability to rheum, a flux, from *ῥεματίζεσθαι*, *rheumatizesthai*, to have a flux, from *ῥεῖν*, *rheina*, flux, flow, from *ῥεῖν*, *rheîn*, Skt. *śru*, to flow). An acute or chronic disease characterized by painful local inflammations. It may be divided for convenience of description into the articular (that involving the joints) and the muscular varieties. Either form may be acute or chronic. Acute articular rheumatism is a constitutional disease, not contagious, and characterized by fever, pain, and inflammation in and around the joints and a tendency to involvement of the pericardium and endocardium. The joints are apt to be attacked in succession. Rheumatism is a disease of moist and temperate climates, and the acute articular form usually occurs in young adults, although children are not by any means exempt.

The close analogy that exists between acute rheumatism and certain of the infectious diseases has led many investigators to believe that it is due to a specific germ, in spite of the fact that no microorganism has as yet been found constantly associated with the disease. A more generally

accepted theory is that it is due to some morbid material produced in the system as a result of defective metabolism. It has been suggested that this material is lactic acid. Others believe that the disease is due essentially to some nervous disturbance. The immediate exciting causes are exposure to wet and cold, or a chilling of the body such as occurs from sitting in a draught. The symptoms often begin quite suddenly, at night, with pain and stiffness in the joints, with nausea and vomiting, followed by all the manifestations of a high fever. The latter may reach as high as 108° F. in severe cases. The pulse is comparatively slow, there is great thirst, profuse acid sweats, and the urine becomes high-colored, scanty, and abnormally acid. The affected joints are painful and tender, hot, red, and swollen. Swelling is apt to be most apparent in joints scantily covered with muscle, viz. the knee, wrist, elbow, ankle, and the joints of the hands and feet. One or more joints may be affected, and the disease travels from joint to joint. Acute rheumatism is distinguished by the number and severity of its complications. These affect principally the serous membranes of the body. Pericarditis (q.v.) is a common complication. Endocarditis (q.v.), which often results in chronic cardiac trouble, is also of frequent occurrence. Pleurisy (q.v.) with effusion is often seen in association with pericarditis. Less often, bronchitis, pneumonia, and inflammation of the cerebral arteries occur. In itself, acute articular rheumatism is not a fatal disease, and the majority of cases recover within a week or ten days. Relapses, however, often occur, and weeks or months may elapse before entire cure is attained.

Chronic articular rheumatism may result from an acute attack, but most frequently it arises independently in persons of advanced middle age. The causative elements are similar to those of the acute form, but the onset is insidious. It is most apt to attack those whose occupation exposes them to cold and damp. The joints gradually become painful and stiff, and the condition varies from time to time. It is worse in the morning and is aggravated by damp weather. Late in the disease the joints become greatly distorted and ankylosis may supervene.

Muscular rheumatism is an affection of the voluntary muscles and of the fasciæ and periosteum to which they are attached. It is inflammatory in character and may be acute or chronic. In contrast to the articular variety, muscular rheumatism is never complicated by cardiac disease. It is a malady of adult life; is almost always due to cold and damp; and one attack predisposes to another. The first attack is generally acute. The onset is sudden with pain in the affected muscles, with slight tenderness, and considerable stiffness and difficulty of movement, by which the pain is increased. Fever is absent or slight. The acute attack lasts about a week. When the disease reaches the chronic stage the attacks return frequently and finally become constant and aggravated when the weather is damp. This form of rheumatism is prone to involve particular groups of muscles, and different names have been applied to it according to its location. When situated in the occipito-frontal muscles it is called *cephalodynia* and may be mistaken for neuralgia of the trifacial or occipital nerves. The eye or jaw muscles may be affected, giving rise to pain when these parts are used. *Torticollis* (wry-

neck) is an affection of the muscles of the side of the neck usually rheumatic. It is generally limited to one side, toward which the head is twisted. *Cervicodynia*, involving the muscles of the back of the neck, is comparatively rare. *Pleurodynia* is applied to a rheumatic affection of the thoracic muscles. Pain is excited by forced breathing, coughing, or sneezing. It is often mistaken for pleurisy or intercostal neuralgia, which it closely simulates. A very common form of muscular rheumatism is *lumbago* (q.v.).

For the efficient treatment of even mild cases of acute rheumatism rest in bed is imperative; indeed, in severe cases the patient cannot do otherwise than lie still. Local measures to relieve pain consist in wrapping the affected joints in cotton wool, upon which some anodyne liniment, such as belladonna or opium, or oil of wintergreen, may be sprinkled freely. The drugs now used internally consist of salicylic acid and its derivatives, with acetanilid, antipyrin, or morphine to relieve severe pain. It is agreed, however, among the best authorities that no medicine has much control over the course or duration of the disease. The diet should consist of milk chiefly, either alone or diluted with barley water, lime water, or vichy. Lemonade is beneficial as a drink. In acute muscular rheumatism hot poultices applied to the parts affected will afford great relief. The treatment of lumbago, wry-neck, pleurodynia, etc., is dealt with fully under those titles. Chronic rheumatism is best treated locally by friction with stimulating liniments. Much relief is obtained both from pain and loss of function by exposure of the joints to superheated air in a specially devised apparatus. Electricity and hydrotherapy (q.v.) are useful in improving the circulation and nutrition of the joints. Internally the most constantly employed drug is potassium iodide. The alkaline waters may be taken habitually. The greatest attention must be paid to the general health, and good food, warm clothing, and tonics, particularly cod-liver oil, iron, arsenic, and strychnine, are necessary to prevent relapses and recruit the strength.

RHEYDT, rit, or **RHEIDT**. A town in the Rhine Province, Prussia, on the Niers, 28 miles northwest of Cologne (Map; Prussia, B 3). It has a handsome new town hall, statues of William I. and of Bismarck, and a fine Hohenzollern fountain in the market-place. It manufactures silks, woollens, velvets, machinery, cigars, paper, etc., and has dye-works. Rheydt received municipal privileges in 1856. Population (commune), in 1890, 26,830; in 1900, 34,031.

RHIN, rāx, BAS- (Fr., Lower Rhine). A former frontier department of France, corresponding nearly to the present German administrative district of Lower Alsace in the Imperial territory of Alsace-Lorraine (q.v.). It was ceded to Germany in 1871 by the Treaty of Frankfurt.

RHIN, HAUT- (Fr., Upper Rhine). A former frontier department in the east of France, with the exception of the Territory of Belfort (q.v.), since 1871 comprehended within the German District of Upper Alsace. The Territory of Belfort is often called Haut-Rhine. See ALSACE-LORRAINE.

RHIND PAPYRUS. A mathematical manuscript written by an Egyptian scribe, Ahmes, who lived before B.C. 1700. It is now deposited in

the British Museum. See AHMES; ALGEBRA; EIGHTH.

RHINE. The principal river of Western Europe. It rises in Southern Switzerland, and flows in a general northwest direction through Western Germany and Holland, emptying into the North Sea after a course of 760 miles (Map; Germany, B 3). The Rhine proper is formed in the Canton of Grisons, Eastern Switzerland, by two main head-streams, the Vorder Rhein and the Hinter Rhein. The former is the larger of the two. It rises on the north slope of the Saint Gotthard group within two miles of the source of the Rhone, at an altitude of 7690 feet, and passes northeast along the base of the Glarner Alps till it meets the Hinter Rhein coming from the south from the glaciers of the Rheinwaldhorn. The combined stream, swelled by numerous mountain torrents to a width of 45 yards, flows northward, separating Switzerland from Liechtenstein and Austria, and enters the Lake of Constance. It leaves the main body of the lake at the town of Constance, and passes into the Unter See (Lower Lake) a short distance farther on. The Rhine now flows westward, becomes narrow and very rapid, finally (below Schaffhausen) plunging over a rocky precipice 70 feet high. Another and smaller fall is encountered at Zurzach, below which the Rhine receives its first great tributary, the Aar, which brings to it the waters of Northwestern Switzerland. The river bed continues for some distance to be narrow and rocky with several rapids. It continues its westward course to Basel, where it makes a sharp turn to the north and enters wholly into German territory, having formed the boundary between Germany and Switzerland from the Falls of Schaffhausen to this point. At Basel the river is 190 yards wide and is henceforth navigable without obstructions. It now flows on the boundary between Baden and Alsace through a wide and level flood plain bordered by the Vosges Mountains on the west and the precipitous and romantic Black Forest on the east. In this valley it passes Strassburg, just below which city it receives the Ill, which drains Upper Alsace. After forming for about 50 miles the boundary between Baden and the Palatinate it is joined at Mannheim by the Neckar from the east. It continues its course northward through Hesse, passing the town of Worms, and at Mainz receives the Main, its principal affluent from the right. At Mainz the river makes a short turn to the west, and then at Bingen an abrupt turn to the northwest. It now enters upon the most romantic and celebrated part of its course, reaching from Bingen to Bonn, a distance of about 80 miles, all through Prussian territory. Here the river is much narrowed and winds between steep mountains rising often from the water's edge. The heights are crowned by the famous ruined castles and the slopes are covered with vineyards, this stretch being well known for the Rhenish wines. The chief town on the Rhine in this part of the course is Coblenz, at the confluence of the Moselle, the largest tributary from the left. After passing the Siebengebirge at Bonn the river and its valley again widen out, and from Cologne to its mouth the Rhine flows through a low, level country, turning gradually westward as it enters Holland. The largest city on its banks below Cologne is Düsseldorf. A short distance below

Düsseldorf the Rhine is joined by the Ruhr from the right, and a little farther down it receives the Lippe, also from the right. Shortly after crossing the Dutch boundary it divides into two arms, the southern and larger of which, known as the Waal, flows into the great delta of Southern Holland, where it merges with the Meuse and the Scheldt. The northern arm divides again at Arnhem, the Yssel coursing north into the Zuyder Zee, and the other arm flowing westward, parallel with the Waal. This latter arm, called Lek (Loek) below Wijk, pours its waters into the North Sea through the Nieuwe (New) Maas. At Wijk a narrow arm, which at first bears the name of the Crooked Rhine, branches out northward and flows past Utrecht, below which it is known as the Old Rhine. At Utrecht the Vecht branches out from this arm and flows into the Zuyder Zee. The Old Rhine, which has barely the dimensions of a river, flows past Leyden, and discharges into the North Sea, a few miles north of Scheveningen.

Commercially the Rhine is probably the most important river of Europe, its valley being densely populated, with numerous important industrial cities, especially along its middle course. Canals connect the Rhine with the Meuse, the Seine, the Saône, the Danube, and the Ems. The Rhine-Rhone Canal follows the course of the river from Strasburg almost to Basel, and is generally used instead of the river, whose current here is very swift. The shipping at the principal ports on the Rhine amounts to nearly 8,000,000 tons annually, and the river is visited every year by more than 1,000,000 tourists. The legends of the Rhine figure prominently in German folk literature.

RHINE, CONFEDERATION OF THE. See CONFEDERATION OF THE RHINE.

RHINE-HESSIE. A province of the Grand Duchy of Hesse (q.v.), Germany.

RHINE/LANDER. A city and the county-seat of Oneida County, Wis., 103 miles northwest of Green Bay, on the Wisconsin River, at the Pelican Rapids, which afford large water power, and on the Chicago and Northwestern and the Minneapolis, Saint Paul and Sault Ste. Marie railroads (Map: Wisconsin, D 3). It is the centre of a region noted for its extensive lumber output, and has several saw and planing mills, a refrigerator factory, a veneer factory, boiler and iron works, etc. Population, in 1890, 2658; in 1900, 4998.

RHINE PROVINCE (Ger. *Rheinprovinz*, or *Rheinland*), or RHEINISH PRUSSIA. The most densely populated province of Prussia, bounded by the Netherlands on the north, Westphalia and Hesse-Nassau on the east, Lorraine on the south, and Luxembourg, Belgium, and the Netherlands on the west (Map: Prussia, B 3). It covers an area of 10,323 square miles. About 43 per cent. of the total area is under tillage. The chief agricultural products are rye, wheat, barley, oats, and potatoes. There are extensive vineyards

along the Rhine and Moselle, and wine is exported on a large scale. The large coal fields to which the province mainly owes its industrial development are situated chiefly along the Ruhr and the Saar. The province produces annually upward of 25,000,000 tons. Iron, zinc, lead, copper, quicksilver, and manganese are mined. Salt, sulphur, and several kinds of stone and useful earth are also produced in considerable quantities. The production of different metal articles from locomotives and guns to needles and small tools ranks first among the manufacturing industries of the province. The textile branches have also attained a high state of development. Some of the textiles, such as the woolen fabrics of Aix-la-Chapelle or the silks of Krefeld, are foremost in the world. The Rhine Province has also extensive glass works, paper mills, chemical works, and tanneries, besides a number of sugar refineries, distilleries, and breweries.

The extensive trade of the province is greatly promoted by the excellent transportation facilities, especially the railways. There are about 2400 miles of railways. The chief commercial centres of the province are Cologne, Düsseldorf, Aix-la-Chapelle, Coblenz, and Duisburg. It is divided into the five districts of Coblenz, Düsseldorf, Cologne, Treves, and Aix-la-Chapelle. The capital is Coblenz. The province is represented in the Prussian Landtag by 28 members in the upper and 62 delegates in the lower chamber. It returns 35 members to the German Reichstag. The population of the Rhine Province more than trebled during the nineteenth century. In 1819 it was only about 1,871,000; in 1900 it was 5,759,000, showing an increase of 12.8 per cent. since 1895. Over 70 per cent. is Roman Catholic.

RHINITIS (Neo-Lat., from Gk. *ῥίς*, *rhis*, nose). Inflammatory disease of the mucous membrane of the nose; nasal catarrh. Low temperature, air in motion and moisture, or mechanical irritants, together with certain bacilli combine to cause a hyperæmic swelling with first a dryness, then an increased production of mucus and a transudation of serum into the blood vessels. Emigration of leucocytes may follow (see INFLAMMATION) and desquamation of epithelium from the mucous membrane may occur. The disease is commonly known as 'cold in the head.' The mucous membrane may remain thickened permanently or may become atrophic, so that an ordinary attack of rhinitis may terminate in three or four days, or may pass into a chronic condition, continuing for months. Some cases are caused by reflex irritation, the primary seat of trouble being in over-stimulated sexual organs. In the treatment of acute rhinitis preparations of ammonium, belladonna, potassium citrate, ipecacuanha, camphor, carbolic acid, and saline cathartics are used, as well as alkaline or astringent topical applications. Similar treatment is used in cases of chronic rhinitis, besides surgical

interference in the way of removal of hypertrophic tissue, both mucous membrane and bone, as well as the correction of intra-nasal deformities. Hay fever (q.v.) is sometimes termed 'pruriginous rhinitis.' *Rhinitis ulcerosa* is considered under OZENA. For a study of the bacteriology of nasal inflammation, see Howard, in *American Journal of the Medical Sciences*.

RHINOCEROS (Lat. *rhinoceros*, from Gk. *ῥινόκερος*, *rhinokrōs*, rhinoceros, nose-horned, from *ῥίς*, *rhīs*, nose + *κέρας*, *keros*, horn). An animal of a family of perissodactyl ungulates (q.v.), the Rhinocerotidae, closely allied to the tapirs, and containing the largest and most powerful of terrestrial mammals, except the elephants. There are five existing species, all natives of the warm parts of Asia, the Indian Archipelago, and Africa. The form of the rhinoceros is massive and uncouth. The limbs are thick and strong; each foot is terminated by three nearly equal toes, covered with broad, hoof-like nails, with a fourth non-functional toe on the front feet. The tail is small and terminated by a small tuft. The head is large, the muzzle prolonged, ears moderately large, eyes small, and nasal bones combined into an arch for the support of a horn or horns. The upper lip in most species is prolonged, pointed, and prehensile. The incisors are defective in the Asiatic species, and, as well as the canines, wanting altogether in the African species; the molars and premolars are alike and highly effective as grinders. The skin is extremely thick and smooth, but soft and sensitive, although in the Asiatic species it has the appearance of a rigid armor, studded with tubercles and jointed in folds or wrinkles where necessary to permit movement of the head and limbs. The hide is used for making whips, harness, ropes, and so on, and when dried and hardened forms a material for shields capable of resisting spear thrusts and old-fashioned bullets. When properly dried and prepared it has the translucency and mottled appearance of tortoise-shell, and from it are made various ornamental objects by East Indian artificers. The nasal horn or horns are formed of a solid mass of agglutinated bristles which spring from the skin of the nose, but are rooted upon a bony plate surmounting the skeleton of the nose. This horn is not only a powerful weapon, but with it the animal can root up and overturn bushes and small trees whose leaves and roots it seeks to eat.

The Indian rhinoceros (*Rhinoceros Indicus*) formerly ranged over most of the peninsula, but is now restricted almost entirely to the Assam plain, and lives chiefly in grassy jungles. It is the largest known species and sometimes exceeds five feet in height and ten feet in length. The single horn is sometimes two feet long and eighteen inches in circumference at the base. The Javanese or Sondaic rhinoceros (*Rhinoceros Sondaicus*) is a much smaller species, also one-horned, found from Bengal to Java. Its armor has a tessellated appearance, and the female is hornless. The Sumatran or hairy rhinoceros (*Rhinoceros Sumatrensis*) is so distinct that some naturalists have placed it in a separate genus (*Cetorhinus*). It ranges from Northeastern India to Borneo, has a more hairy coat than the others, and two short blunt horns, one behind the other. A hairy-eared race (var. *lasiotis*) inhabits Assam.

The two species of African rhinoceros differ from the Asiatic ones mainly in the absence of incisor teeth and in the smoother, untubed skin, and they have been put into a separate genus (*Aelodonta*) by some naturalists. Possibly a third species exists, of which nothing very definite is known. The more familiar and widespread of the African rhinoceroses is the 'common' or 'black' one (*Rhinoceros bicornis*) formerly abundant all over the eastern and south-central parts of the continent, but now become rare and restricted. It is not black, but bluish lead color, or anything rather lighter than the other species usually called 'white.' This rhinoceros stands 5½ feet at the withers in the case of large males or 'bulls,' and has two horns. The front one, usually much the longer in South African examples, sometimes attains a length of 40 inches, but is always less in northern specimens. The rear horn varies from a mere knob to a length almost equal to its fellow, and is usually straighter and much compressed. The upper lip is pointed, extensible, and prehensile, and this species feeds almost wholly on leaves, twigs, and roots. It frequents bushy and rocky districts rather than open plains. It spends the day in an accustomed lair well hidden from observation, and starts at sunset for a drinking-place along a well-trodden path. Having drunk, it will wander about feeding during the night, will drink again at daybreak, and then return to its resting-place. Some hunters regard this rhinoceros as naturally ferocious and vindictive, while others consider it stupid and timid, but subject to sudden panics, in which it is as likely to rush headlong toward the hunter as away from him. At best, however, it is dangerous, and its speed and agility are extraordinary. The other African species, the white, Burchell's or 'square-mouthed' rhinoceros (*Rhinoceros simus*), is larger than the 'bicornis,' the biggest, indeed, of the entire tribe, and differs from the other prominently in having a blunt, squarish muzzle, the upper lip not being at all prehensile. In conformity with this it is a grazing, not a browsing animal.

Fossil RHINOCEROSSES. The existing species are the lone remnants of a once numerous group that abounded in North America from Eocene to late Miocene time, and in Europe from Eocene to Pliocene time. The fossil and living species may be grouped under three families. The Hyracodontidae, represented by the genera Hyrachyus and Hyracodon of Eocene and Oligocene time, comprised hornless, lightly built animals adapted for running on the uplands. They show a tendency to reduce the number of functional digits of the feet from five to three and thus to parallel the evolution seen in the horse's foot. The Amynodontidae, comprising the American genera Amynodon, Metamynodon, and the European Cadurocotherium, were heavily built, short-bodied animals adapted to more or less aquatic habits of life. The skull was hornless and the eyes were situated high on the head. The upper incisors are reduced and the canine teeth are enlarged to form tusks for use in uprooting water plants. The true rhinoceroses (Rhinocerotidae) began as light limbed runners without horns, that lived at the same time as the members of the two preceding families. After the hyracodonts and amynodonts had become extinct the rhinoceroses began to adapt themselves to

the habit or life of their predecessors and ways along six different lines of descent. A recent animal, *Elasmotherium*, found in the Pliocene deposits of Northern Asia, thought to have descended from *Aceratherium*, attained a length of 15 feet, and had two large horns in tandem and prismatic teeth. The woolly rhinoceros (*Atelodus antiquitatis*) is found fossil in the Pleistocene deposits of England and in the cave deposits of Europe, and its complete carcasses have been obtained from the frozen mud banks of the tundras of Northern Siberia. It was a large two-horned species, with a heavy fur of coarse woolly hair.

BIBLIOGRAPHY. The best general account of the tribe is by Lydekker in *Royal Natural History*, vol. ii. (London, 1896). Consult, also: Blandford, *Fauna of British India: Mammals* (ib., 1888-91); Baker, *Wild Beasts and Their Ways* (ib., 1890); Hornaday, *Two Years in the Jungle* (New York, 1885); Drummond, *Large Game . . . of Southeast Africa* (Edinburgh, 1875); and similar books of naturalists and sportsmen relating to Southern Asia and Africa; Osborn, "Phylogeny of the Rhinoceroses of Europe," *Bulletin of American Museum of Natural History*, vol. xiii. (New York, 1900); id., "The Extinct Rhinoceroses," *Memoirs of the American Museum of Natural History*, vol. i., part iii. (ib., 1898). See Colored Plate of PACHYDERMIS.

RHINOCEROS BEETLE. A name in the South for a large scarabæid beetle (*Dynastes tilysus*). It is most abundant in the southern Atlantic States, but extends west to New Mexico and north to Cape May and southern Pennsylvania. It is a large beetle, nearly 2½ inches in length, and is stout. The male has two long

A MALE RHINOCEROS BEETLE.

horns, one extending forward from the head and the other from the thorax, from which fact it derives its popular name. The female resembles the male, but lacks the horns. It is pale bluish gray in color and the wing-veins are marked with darker irregular spots. The egg is an eighth of an inch in length and is laid in rich earth or decaying trunks of old trees of several varieties. The insect in all stages has a very strong and disagreeable odor.

RHINOCEROS-BIRD. (1) An oxpecker or buffalo bird (qq.v.) which settles upon the backs of rhinoceroses. (2) A hornbill.

RHINOCEROS HORNBILL. See HORNBILL.

RHINODERMA (Neo-Lat., from Gk. *ῥhis*, nose + *δέρμα*, *derma*, skin). A small frog (*Rhinoderma Darwini*) of Chile, remarkable for

its bell-like voice, and for the fact that the internal vocal sacs in the throat of the male are converted into nests for the eggs, which hatch there, whereupon the sacs become nurseries for the 5-15 tadpoles until they reach maturity. The process is not wholly known, but has been studied by Espada, an outline of whose investigations is given in English by Gadow, *Amphibia and Reptiles* (London, 1901).

RHINOPLASTIC OPERATION (from Gk. *ῥhis*, nose + *πλάσσειν*, *plassein*, to mold). When a portion or the whole of the nose has been destroyed by accident or disease the deficiency may be restored by a transplantation of skin from an adjoining healthy part. After paring away any remains of the old nose, a flap of skin of the required shape is carefully dissected from the forehead until it hangs by a narrow strip or pedicle between the eyebrows. Then after all bleeding is stopped the flap is twisted on itself so that its skin surface remains out, while its base is brought down in position to correspond to the original base of the nose. The edges of the flap are then sutured accurately to the denuded edges of the former membrane, spaces being left on either side of the lower end of the flap for the nostrils. As practiced at the present time the operation has received two important modifications: The first consists in the use of a permanent frame of gold or aluminum or platinum, which is fastened into the bony framework surrounding the nasal aperture and which gives shape and profile to the nose; the second consists in the employment of skin-grafts to cover the unsightly area in the forehead and prevent the deforming cicatrix that would otherwise result. See AUTOPLASTY; SKIN-GRAFTING.

RHINS, řân, JULES LÉON DUTREUIL DE (1846-94). A French geographer and explorer, born at Saint Etienne. He took part as a midshipman of naval volunteers in the expedition to Mexico and was an ensign during the Franco-Prussian War. From 1871 to 1876 he was captain of a foreign-going ship, in 1876-77 commanded the *Scorpion* of the King of Annam's navy, and in 1882 was Egyptian correspondent of the *Temps*. From 1891 to 1894 he explored Chinese Turkestan (Eastern Turkestan), and the most inaccessible and least-known regions of Northern and Western Tibet. He was murdered by natives at a small town of Eastern Tibet. His publications include *Le royaume d'Annam* (1879), *Carte de l'Indo-Chine orientale* (1881), *Levé du cours de l'Ogooné* (1884), and *L'Asie centrale* (1889). The results of his last journey were edited by his assistant, Grenard, *Mission scientifique dans la Haute-Asie* (3 vols., 1897-98).

RHINTHON, řin'thôn (Lat., from Gk. *ῤῥίνθων*). A Greek comic poet of Tarentum who lived about B.C. 300. He was the first to develop in a written form and to introduce into Greek literature the so-called Hilarotragedia (*Ἰλαροτραγῳδία*), a species of burlesque tragedy in which the tragic myths were treated in the spirit and style of comedy. He is frequently quoted by Cicero and Varro, and by Athenæus, Hesychius, and other Greek writers, but of his 38 dramas only insignificant fragments are extant. Consult Völker, *Rhintonis Fragmenta* (Halle, 1887).

RHIZOCARPEÆ. See PALEOBOTANY.

RHIZOCEPH'ALA (Neo-Lat. nom. pl., Gk. *ῥιζοκέφαλος*, *rhizokephalos*, having the lower growing immediately from the root, from *ῥίζα*, *rhiza*, root + *κεφαλή*, *kephalē*, head). An order of most degraded cirripeds, the root-barnacles, especially of the genera *Sacculina* and *Peltogaster*. The few forms known are parasitic on the abdomens of various crabs.

RHIZ'ODON'TIDÆ (Neo-Lat. nom. pl., from Gk. *ῥίζα*, *rhiza*, root + *ὀδούς*, *odous*, tooth). A family of carnivorous Paleozoic fishes of the crossopterygian suborder Rhipidistia, in which the median fins are always more or less subdivided by a process of concentration analogous to that prevalent among dipnoans. The notochord was persistent, and the jaws bore many peculiar teeth. These teeth were highly complicated in

EUSTHENOPTERON FOORDI.

the Holopteryhida, less so in the Rhizodontida, with a larger central cavity. A well-known example, found in an unusually good state of preservation, is *Eusthenopteron Foordi*, herewith figured, which abounds in the Devonian rocks of Quebec, and whose pectoral fin has only one stout basal cartilage—an 'archipterygium.' All were small fishes. Consult Woodward, *Vertebrate Paleontology* (Cambridge, 1898).

RHIZOIDS (from Gk. *ῥιζοῖδής*, *rhizoidēs*, root-like). Colorless, hair-like structures developed by liverworts, certain algae, mosses, and fungi (toadstools and molds). Their function is to anchor the plant in favorable situations and in some cases perhaps to absorb water. The ferns have rhizoids only in connection with the very small prostrate sexual plant (gametophyte, q.v.).

RHIZOP'ODA (Neo-Lat. nom. pl., from Gk. *ῥίζα*, *rhiza*, root + *πούς*, *pous*, foot). The first and lowest class of Protozoa (q.v.); a large assemblage of varying forms agreeing in the possession of projections of the body-protoplasm called 'pseudopodia.' These pseudopodia are used as organs of locomotion and also for ob-

1. A radiolarian, showing the interior; 2, cross-section of the same through the processes.

taining food. They may be of very irregular and constantly changing shape or comparatively rigid, independent of each other, or forming a very complex network. The protoplasm or 'sarcode' of a rhizopod consists of an outer layer called 'ectosare,' which is thin, transparent, and homogeneous, and an inner portion called 'en-

dosare,' which is granular and more opaque. Most of the numerous species are spherical with radiating pseudopodia, but the lowest forms have no constant shape. Most rhizopods are provided with some sort of shell, but the lowest forms have no such covering. The simplest shells are those made up of particles of dirt or foreign material of some sort, united together by some secretion of the ectosare; in other cases the shell is formed of a horny material called 'acanthin' or of carbonate of lime or silica, often in a very remarkable and elaborate pattern. Generally rhizopods are freely moving animals, but some are attached in adult life by stalks. The individuals are usually distinct, but colonial rhizopods are known, and such colonies are sometimes half an inch across.

The only internal organs of the Rhizopoda are the 'vacuoles,' those which contain more or less digested food and those which contain the waste matter or excreta of the body. The latter are the larger and more conspicuous, and, owing to the sudden collapse when the excreta are thrown out of the body, are known as 'contractile vacuoles.' Reproduction takes place by simple budding or fission, the two processes differing only in the relative size of the resulting individuals. The formation of spores, however, occurs in many cases, especially after a resting period. Such resting periods occur during unfavorable conditions such as prolonged cold or drought, or when an unusual amount of food has been taken. In most cases during such a resting period the rhizopod surrounds itself with a firm, impervious coat, called a 'cyst.' When the unfavorable conditions cease the sarcode divides up into several minute spores, each of which on the dissolution of the cyst becomes a new individual. The growth of these individuals is rapid when food is abundant. For further information, see Bütschli's *Protozoa* in Bronn's *Klassen und Ordnungen des Thierreichs* (Leipzig, 1887); concerning fresh-water forms, see Leidy *Fresh Water Rhizopods of North America* (Washington, 1879).

RHODE ISLAND. A North Atlantic State of the United States, belonging to the New England group, and situated between latitudes 41° 18' and 42° 3' N., and between longitudes 71° 8' and 71° 53' W. It is bounded on the north and east by Massachusetts, on the south by the Atlantic Ocean, and on the west by Connecticut. Rhode Island is the smallest in area of the United States. It has an extreme length from north to south of 48 miles, and an extreme width from east to west of 36 miles. Its area is 1250 square miles, of which 1053 square miles, or 673,920 acres, are land surface.

TOPOGRAPHY. The greater part of the State belongs to the eastern Appalachian belt known in the Southern States as the Piedmont Plain. It is rough and hilly, though the general elevation is not great, being less than 600 feet throughout the State, with the exception of a few monadnocks. The highest point is Durtet Hill, near Gloucester, in the northwestern part; its altitude is 805 feet. The western part of the coast line is bordered by lagoons and marshes, while the eastern part of the State is separated from the main portion by Narragansett Bay, a large, irregular, and branching inlet extending 28 miles inland, with a breadth of from 12 to 3 miles. It incloses a number of islands, the

largest of which are Aquidneck or Rhode Island, Conanicut, and Prudence Island. Aquidneck, containing the town of Newport, is a beautiful island, 15 miles long and 3 miles wide. It is lined with bold cliffs and fine beaches, and is known as the 'Eden of America.' Nine miles off the coast lies Block Island, a sandy reef inclosing a salt lagoon. The rivers of the State are small. The three largest are the Blackstone and the Pawtuxet in the north, flowing into the upper part of Narragansett Bay, and the Pawcatuck in the south, flowing into the Atlantic Ocean on the Connecticut boundary. All of these are rapid streams, with a number of falls supplying considerable water-power. Like all glaciated areas, the State is studded with numerous small lakes.

CLIMATE AND SOIL. The climate is mild and equable compared with that of the rest of New England. It is influenced chiefly by winds coming from the Gulf Stream. The cold winds striking the eastern coast of New England are almost unfelt here. The mean temperature for January is 36° and for July 76°. The average relative humidity ranges between 80 and 95 per cent. throughout the year. The average rainfall is about 45 inches, ranging in localities from 40 inches in the north to nearly 50 on the coast. The soils are in general coarse, stony, and not well adapted for agriculture, and there is very little alluvial land.

GEOLOGY AND MINERAL RESOURCES. Archaean rocks, chiefly the Montalban gneisses, form the surface of the western half of the State to within three miles of Narragansett Bay. The Narragansett Basin, including the bottom of the bay, its islands and both shores, together with a region running northeast into Massachusetts, forms an interesting patch of Carboniferous deposits. It seems to have been a shallow trough undergoing a continual subsidence as the coal beds and intervening strata were laid down, until the whole deposit attained a thickness of several thousand feet. The basin has since been subjected to folding movements, in which process the strata were crushed and faulted, and the coal converted into graphitic anthracite, and locally almost or wholly into pure graphite. These anthracite beds form the principal mineral deposits of the State, but access to large portions of them is difficult, owing to the proximity of the bay. Along a part of the western edge of the Carboniferous area runs a dike of magnetite iron ore containing considerable deposits, while limestone and granite are the most important of the other mineral resources.

FISHERIES. The fisheries employed in 1898 about 1700 persons. The value of the product for that year was \$955,058, to which the oyster catch contributed more than \$500,000. Next to oysters the most important fish are scups and squeteagons.

AGRICULTURE. In Rhode Island the number of acres included in farms decreased 17.8 per cent. between 1850 and 1900, the acreage in the latter year being 455,602, or 67.6 per cent. of the total land surface. The number of farms meanwhile remained almost the same, so that the average size decreased from 103 acres in 1850 to 83 in 1900. The improved land in 1900 (41.1 per cent. of the farm acreage) was only a little over one-half as great as the improved area in 1850. In the census year 1900 the most important cereal, corn, represented only 8149 acres, and the next

in rank, oats, only 1530 acres. Hay and forage form by far the most important crop, amounting in 1899 to 69,776 acres; but this was a decrease from 94,111 in 1889. Potatoes are relatively important, representing, in 1899, 5817 acres. Sweet corn and other vegetables are grown for the local markets. Much attention is given to the growing of apples, peaches, and pears. The number of peach trees increased over four-fold between 1890 and 1900. Considerably over half the fruit trees are in Providence County. Cranberries, strawberries, and other small fruits are grown.

STOCK-RAISING. Significant increase was made in the number of horses in the last half of the nineteenth century, but there was a very great decrease in the number of dairy cows, sheep, and swine. The following table shows the number of domestic animals on farms:

	1900	1890
Dairy cows.....	23,660	23,943
Other cattle.....	12,374	10,834
Horses.....	11,390	9,864
Mules and asses.....	43	51
Sheep.....	6,629	11,400
Swine.....	11,508	12,055

In 1899 the value of dairy products was \$1,923,707. Of this amount \$9.2 per cent. was realized from sales, mainly of milk. In the decade of 1890-1900 there was a decrease of 49.4 per cent. in the quantity of butter produced on farms, and an increase of 21.8 per cent. in the quantity of milk.

MANUFACTURES. Since 1870 over 22 per cent. of the total population have been engaged as wage-earners in this line of industry. The number in 1900 was 96,528, of whom 26,984 were women, and 5036 children under sixteen years of age. The total value of products increased 29.2 per cent. from 1890 to 1900, being in the latter year \$184,074,378. The shallow depth of the water at the port of Providence has prevented the development of ocean traffic and thus has withheld from the State a great advantage. The raw materials of manufacture are transported long distances, and the centralization of the railroads has in a measure deprived the State of the advantages of competitive rates. Rhode Island has become well known for the superiority of certain of its products. The State has ranked second in cotton manufacture from the beginning of the industry, as estimated by the number of spindles employed. The spinning of cotton by the factory system began in 1790 at Pawtucket, and it was here that cotton was first spun by water power in the United States. As early as 1815 there were 140,000 spindles within a radius of 30 miles of Providence. Since 1890 a very slight decrease has taken place in the number of spindles, the number in 1900 being 1,920,522.

The manufacture of wool in the State by the factory process began in 1804; here the first power loom used in the manufacture of woollens in the United States was installed in 1814. Between 1890 and 1900 the production of worsted goods increased enormously, and the State ranks second in this branch of the woolen industry. But the value of other kinds of woolen goods has greatly decreased. The dyeing and finishing of textiles are industries which have increased enormously

AREA AND POPULATION OF RHODE ISLAND BY COUNTIES.

County.	Map Index.	County Seat.	Area in square miles.	Population.	
				1890.	1900.
Bristol.....	C 3	Bristol.....	35	11,428	13,144
Kent.....	B 3	East Greenwich.....	169	26,754	29,976
Newport.....	C 3	Newport.....	117	28,552	32,599
Providence.....	B 2	Providence.....	411	255,123	328,683
Washington.....	B 4	Kingston.....	331	23,649	24,154

since 1890, as has also been the case with the silk and silk goods industry. Next in importance to the textiles are jewelry and silverware. The State ranks first in each of these and second in the reducing and refining of gold and silver not from the ore. These industries are almost wholly concentrated in Providence. They began here prior to the Revolution, but the prominence of the city in this respect dates from about 1894, when improved machinery was applied. All three of these industries made large gains in the decade 1890-1900. The foundry and machine-shop industry mainly turns out engines and boilers, for which the State has an established reputation. The manufacture of rubber boots and shoes (not included in the appended table) amounted in 1900 to \$8,034,417 in value, and the manufacture of electrical apparatus reached \$5,113,292 in the same year.

The following table shows the relative importance of most of the leading industries:

INDUSTRIES	Year	Number of establishments	Average number, wage-earners	Value of products, including custom work and repairing
Total for selected industries for State.....	1900 1890	614 514	66,981 60,084	\$116,440,265 90,433,113

TRANSPORTATION AND COMMERCE. The railroad mileage increased from 108 in 1860 to 217 miles in 1890 and decreased to 209 in 1900. All the important lines are under the control of the New York, New Haven and Hartford Railroad. The value of foreign imports at the port of Providence for the year ending June 30, 1901, was \$1,146,511. The exports are altogether insignificant. Of greater importance is the coastwise traffic, there being a considerable trade with the important North Atlantic ports. Newport and Bristol and Warren are also customs districts, but the trade of both is small.

BANKS. The first bank of Rhode Island was

the Providence Bank, founded in 1791. The early banking history of the State, however, centres around the Providence Institution for Savings, which dates from 1819. It has been the tendency during the past few years for the national banks and savings institutions either to liquidate or become trust companies. The report of the Comptroller of the Currency for the year ending June 30, 1902, gives the following statistics:

	National Banks	State	Savings
Number.....	36	4	21
Capital.....	\$12,065,000	\$895,000	\$1,338,000
Surplus.....	3,788,000		2,644,000*
Cash, etc.....	1,244,000	92,000	2,644,000*
Loans.....	27,472,000	1,002,000	41,829,000
Deposits.....	19,154,000	7,735,000	71,900,000

* Including amount due from banks and bankers.

GOVERNMENT. The State Constitution was adopted in 1842, replacing the original charter granted by King Charles II. An amendment proposed in the General Assembly must receive the votes of a majority of all the members elected to each House at two consecutively elected Assemblies, and then be approved by three-fifths of the electors present and voting in the town and ward meetings.

Since 1888 a residence and home in the State for two years and in the town or city for six months preceding an election have been required for voting, with a small additional property qualification for those voting for the city council of any city or upon any proposition to impose a tax or for the expenditure of money in any town or city. The capital of Rhode Island is Providence.

LEGISLATIVE. According to the amendment of 1900, the General Assembly meets on the first Tuesday of January in each year at Providence. Each town or city has one representative in the Senate, and one or more in the House of Representatives, but no town or city can have more than one-sixth of the 72 members to which the House is limited, and no town or city can be divided for purposes of representation. Senators and Representatives are paid according to time of actual attendance, with a maximum limit of 60 days, plus mileage. The House impeaches and the Senate tries all cases of impeachment.

EXECUTIVE. The Governor, Lieutenant Governor, Secretary, Attorney General, and Treasurer are annually elected at the same time and place as are Senators and Representatives, namely, at the town, ward, and district meetings, on the Tuesday next after the first Monday in November. They hold office one year. The Lieutenant Governor succeeds to the Governorship in case of a vacancy, and in case of further vacancy the position is filled by appointment by the General Assembly acting in grand committee. The pardoning power is exercised by the Governor with the advice and consent of the Senate.

JUDICIAL. The judicial power is vested in one Supreme Court and such inferior courts as the General Assembly may establish, the powers of the several courts being prescribed by law. Judges of the Supreme Court are elected by the General Assembly in grand committee, and their term of office continues until their positions are declared vacant by a resolution of the General Assembly.

FINANCES. The paper money system, which was prevalent throughout all the colonies, kept Rhode Island's finances in a continual state of disorder. The Revolution left the State with a large debt and heavy taxes, and this condition of affairs was not remedied until Rhode Island joined the Union. In 1789 the Revolutionary debt was repudiated by the passage of the compulsory tender act compelling creditors to accept paper money at an arbitrary rate. On January 1, 1902, the balance on hand in the treasury amounted to \$158,272.71. The total receipts during the year were \$1,490,621.96 and the expenditures \$1,537,502.41. There was a balance on hand of \$111,392.26 on January 1, 1903. The total debt was \$2,998,000. From this sum, however, there should be deducted a sinking fund of \$444,451.56.

MILITIA. In 1900 there were 95,737 men of militia age. The militia in 1901 numbered 1413.

POPULATION. The population increased from 68,825 in 1790 to 147,545 in 1850, 345,506 in 1890, and 428,556 in 1900. As to population, the State stood 34th in rank in 1900. There were in that year 407 inhabitants to the square mile, which figure exceeded that for any other State. There was a foreign-born population (1900) of 134,519, Ireland, Canada, and England being chiefly represented. The percentage of city population is very large. In 1900 Providence had a population of 175,597; Pawtucket, 39,231; Woonsocket, 28,204; Newport, 22,034; and Central Falls, 18,167.

The State sends two members to the National House of Representatives.

RELIGION. The principal Protestant denominations are the Baptist, with one-third of the total Protestant church membership, and the Protestant Episcopalians, with about one-fifth. The Roman Catholics have about one-fourth of the population.

EDUCATION. The public school system was established in 1828 and was greatly improved under the administration of Henry Barnard (q.v.). The proportion of illiteracy, due in large part to the numbers of foreigners, is greater than in any other of the North Atlantic States—8.4 per cent. in 1900. In 1900-01 the school population (5-15 inclusive) of the State was 85,084, of whom 69,067 were enrolled in schools. Of the 1960 teachers employed in the public schools in 1900-01 the male teachers constituted only 9.1 per cent. The average monthly salaries of male and female teachers in the same year were \$115.32 and \$51.14 respectively. The school fund is insignificant. The State has only one normal school. It is situated at Providence. The State maintains a college of agriculture and mechanic arts. For Brown University, see article.

CHARITABLE AND PENAL INSTITUTIONS. There are a State hospital at Providence and a soldiers' home at Bristol. There are two insane hospitals, one at Providence and the other at the State farm, Cranston. Other State institutions located at the State farm are the alm-house, workhouse, reformatory, and penitentiary. In 1901 the State appropriated \$259,000 for the maintenance of the State institutions and \$136,891 for construction.

HISTORY. The stories of Norse exploration within the present limits of the State rest upon slight foundation. True history begins when Roger Williams (q.v.) was banished from Massachusetts Bay, and settled with a few com-

panions, at 'Providence Plantations,' on land purchased from the Narraganset Indians, probably in June, 1636. Already, however, William Blackstone, who had fled from the tyranny of the 'lords brethren' in Massachusetts, as he had left England to escape the 'lords bishops,' had settled near Pawtucket River. In March, 1638, a band of Antinomians banished from Massachusetts Bay, under the leadership of William Coddington and John Clark, made a settlement at Pocasset (Port-mouth), on Aquidneck Island (Rhode Island). The next year a secession from this settlement founded Newport, but in 1640 these two towns were united under William Coddington as Governor. In 1643 Samuel Gorton (q.v.) founded Warwick upon the mainland. At Providence the government was at first a pure democracy, "ignoring any power in the body politic to interfere with those matters which alone concern man and his maker." Each of these settlements was at first independent. In 1642 it was determined to seek a patent from England, and the next year Roger Williams went to England for this purpose. Through the influence of the Earl of Warwick, Parliament granted (1644) a charter uniting the settlements as the "Incorporation of Providence Plantations in the Narraganset Bay in New England."

The towns, at first, from jealousy and exaggerated ideas of individual importance, refused to enter into the confederation, but finally through fear of revolutions within, and of Massachusetts without, the union was formed in 1647. This jealousy lasted well into the nineteenth century and explains much of the peculiar conduct of the colony and of the State. Complete religious toleration was granted together with the largest measure of political freedom. William Coddington sought to bring the Island into relations with the United Colonies of New England, while President. In 1650 he went to England, and in 1651 secured a grant of the islands within the colony. Williams was able to have this grant vacated in 1652, but not until 1654 were the settlements again united. In 1663 the charter of Rhode Island and Providence Plantations was secured, and this served as a constitution until 1843. During the war waged on charters by James II., the charter of Rhode Island was abrogated by Sir Edmund Andros (q.v.), 1686-89, but on his deposition the old government was quietly renewed under it, though a property qualification for suffrage was added in 1724.

Relations with the other New England colonies were unpleasant. The colony suffered severely in the war with King Philip (q.v.), though opposed to the policy which caused it. Connecticut and Massachusetts claimed practically all of the territory included in the charter limits. The Connecticut boundary, after much wrangling, was finally settled in 1727, and the Massachusetts boundary was confirmed in 1746-47, but was not finally settled until 1862. Both of these colonies looked on Rhode Island as a nest of heretics and a refuge for the disaffected. The colony was shut out from the United Colonies of New England, and in every way made to feel her slight influence. Nevertheless the growth of the colony in population and wealth was steady, and many of the inhabitants turned to the sea for a livelihood. In the colonial wars Rhode Island privateers inflicted much damage, and some of her

citizens were accused of piracy. In 1775 an army of observation was organized for the defense of the colony, and two of the thirteen ships ordered by Congress were built here. Rhode Island renounced allegiance to Great Britain on May 4, 1776, and united with the other colonies for defense. During the Revolution Newport was held (1776-79) by British troops, and in 1780 the French fleet was stationed there. The famous soldier of Rhode Island was General Nathanael Greene (q.v.). After the Revolution the State blocked every attempt to give increased power to Congress. This was partly due to the prevalent exaggerated individualism and partly to the desire to retain the right to levy import duties and to force her paper money into circulation. Much paper money had been issued early in the century and in 1786 another era of inflation began. The paper issued on land mortgages depreciated, but many attempts were made to make it a legal tender. A debtor might deposit with a judge of the court the sum owed and upon notice to the creditor the debt was legally satisfied. The notices began, "Know Ye," and hence the epithet applied in derision to residents of the State. The country or paper money party was in complete control, and a test act requiring all to regard the paper as equal to specie was passed.

The State refused to send delegates to the convention which drew up the Federal Constitution, and when that instrument was submitted for approval it was overwhelmingly rejected by the town meetings. Many attempts to call a convention to consider the Constitution failed, and it was not until threats of coercion had been made that the instrument was ratified, May 29, 1790. Though the commercial and manufacturing interests of the State grew rapidly, the power still lay in the country districts, as the basis of representation had not been changed since the granting of the charter, except to admit new towns. Dissatisfaction finally culminated in Dorr's Rebellion in 1841. (See DORR, THOMAS WILSON.) A new State constitution was adopted as a result in 1842, which has been frequently amended since. The property qualification for suffrage was not abolished until 1888, and election by a plurality has been allowed since 1893. Previously the election of Governor and State officers was often thrown into the Legislature. Until 1900 the Legislature met in Newport in April to canvass the vote and adjourned to Providence in January to transact business. Now all sessions are held in Providence. A prohibitory amendment to the Constitution was adopted in 1886, but was repealed in 1889. During the Civil War the State furnished more than her quota of troops. In national politics the State has been erratic. From 1792 to 1800 she gave her vote to the Federalist electors, but in 1804 was Democratic. In 1808 and 1812 the Federalists again secured control, but in 1816 and 1820 the State was once more Democratic. Rhode Island supported the tariff wing of the Democracy in 1824, but in 1828 was National Republican (the name originally borne by the Whig Party) and in 1832 Whig, only to be Democratic again in 1836. From 1840 to 1848 the Whig candidates received her votes, and in 1852 the State went back to Democracy. Since 1856, however, the State has been Republican in national elections:

GOVERNORS.		
PROVIDENCE (GOVERNMENT OF EXECUTIVES FROM ITS ORGANIZATION UNTIL 1790) (SEE THE PATENT IN 1647)

RHODES (Lat. *Rhodus*, from Gk. 'Ρόδος). An island now belonging to Asiatic Turkey and long an important, wealthy, and independent State of ancient Greece. It lies off the southwest coast of Asia Minor, from the nearest point of which it is distant about 12 miles. It is 49 miles long and 21 miles in greatest breadth, and is traversed in the direction of its length—from northeast to southwest—by a chain of mountains, which reach in Mount Atayros (the ancient Atabyrion) a height of 4070 feet. The present population is about 30,000, of whom two-thirds are Greeks. The island is governed by a Turkish pasha, but is in general neglected, and shows few traces of its ancient prosperity. Its climate is temperate and its valleys are fertile, producing oil, oranges, citrons, etc.

Rhodes rose into importance at a very early period. It is certain that Ialysus was a place of trade during the second millennium B.C., for Mycenaean vases have been found in its necropolis. When the island first appears in history it is peopled by Dorians who dwell in three cities, Lindus, near the centre of the east coast, with a good harbor, and still a town; Camirus, on the west coast; and Ialysus, also on the west coast, near the northern end of the island. These cities, with Calymna, Cos, and Halicarnassus, formed the Dorian Hexapolis which later, by the expulsion or withdrawal of Halicarnassus, became a Pentapolis. During the seventh and sixth centuries B.C. the island shared in the commercial prosperity of the Greek States of Asia Minor. A colony was planted at Phaselis, on the east coast of Lycia, and, along with the Asiatic Greeks, the Rhodians took part in the first colonizing of Sicily, where they settled Gela, according to the tradition, about B.C. 690. A hundred years later,

after an unsuccessful attempt at Lilybrum, another band settled the Lipari Islands. Secure from attack by land, and on friendly terms with the unaggressive naval powers of Phœnicia and Egypt, the island maintained its independence till the Persian conquest, and did not finally yield till after the Ionian revolt, at the beginning of the fifth century B.C. The Rhodians were among the Greeks who served with Xerxes, though their contingent was small. After the Greek victories, they joined the Delian League, thus passing ultimately into the Athenian empire. They revolted in B.C. 411, and in 408 the three cities combined to found a new capital of the island. This city, Rhodes (q.v.), henceforth represents the island. Excavations were begun on the Acropolis of Lindus in 1902 by Danish scholars, and in the first season the Propylæa and ancient Temple of Athena were discovered.

RHODES. The capital of the island of the same name, situated at its northern extremity, with harbors on the east side, and the Acropolis on a hill which rises abruptly from the west coast. The modern city, called Kastro, has a picturesque appearance from the sea as it rises gradually from the two harbors, now choked with sand. In ancient times the main harbor was fortified and could be closed. The present fortifications only include about one-fourth of the ancient city, and date largely from the fifteenth century. The place has preserved its mediæval aspect, and there are many traces on the stone houses of its occupation by the Knights of Saint John, besides the great castle, the hospital, and especially the straight and picturesque Knights' Road, lined with ancient buildings bearing coats of arms. The earthquakes of 1851, 1856, and 1863 wrought great destruction in the town. By the powder explosion of 1856 the Church of Saint John, built in 1500, and the Grand Master's palace, were badly damaged, and the two edifices were destroyed by the earthquake of 1863.

Rhodes was founded in B.C. 408, and was girt by strong walls, surmounted by towers, and provided with two excellent harbors. It soon attained wealth and a very important commercial position. The early years of the fourth century were marked by struggles between democracy and aristocracy, leading to interventions by Sparta and Athens. Rhodes joined the second Athenian League, but in B.C. 356, with Byzantium, Chios, and Cos, withdrew, thus bringing about the Social War, which ended in Athens conceding the independence of the allies. Rhodes, however, soon fell under the control of Mausolus of Caria, but again became free, though in B.C. 332 it voluntarily acknowledged Alexander. This King greatly favored the city, whose trade rapidly increased, though it was occupied by a Macedonian garrison. On the death of Alexander, B.C. 323, the Rhodians rose and expelled the intruders. The third and second centuries B.C. were the acme of Rhodian prosperity. Wealth had not corrupted the dignity and morality of the people. Art flourished, filling the city with statues and planting at the mouth of the harbor the famous Colossus (q.v.). A later school of art, probably in the first century B.C., produced the Laocoön. In the wars of the period the Rhodians seem to have sought to hold aloof unless their trading interests were threatened. Like the kings of Pergamum, they appealed to Rome as a better ally than their

powerful neighbors, and joined in the war against Philip V. of Macedonia. Later, during the war with Perseus, they endeavored to check the Roman advance, and the Roman Senate punished this presumption by making Delos a free port, with damaging effect on the Rhodian trade. After the death of Caesar, whose side the Rhodians had taken against Pompeius in the civil war, they were defeated in a naval engagement by Cassius, who in B.C. 42 entered the city by force, massacred the hostile leaders, seized the public property, and rilled the temples. This visitation broke the power of Rhodes, but it long continued to maintain its prestige as a seat of learning. Even under the Roman Empire, Rhodes continued to maintain a nominal independence and was not attached to any province, except for brief periods, when in disgrace with the reigning Emperor. In the reorganization of the Empire by Diocletian this position was abolished, and Rhodes became the centre of the Province of the Islands. It was afterwards attached to the Byzantine Empire and shared its fortunes till in 1309 it was occupied by the Knights of Saint John of Jerusalem, who for over 200 years maintained themselves against the Turks, and even gained some foothold on the mainland. They withstood several sieges, notably one in 1480, but were attacked again in 1522 by Sultan Solyman the Magnificent, and after the most heroic resistance finally found their position untenable, and were forced to abandon the island. RHODES, COLOSSUS OF. See COLOSSUS.

RHODES, CECIL JOHN (1853-1902). A South African statesman and financier, born at the vicarage of Bishop Stortford, Hertfordshire, England, July 5, 1853. In 1870 his name was entered at Oriel College, Oxford, but an affection of the lungs compelled him in the same year to sail for Natal, whence, in 1871, he made his way to the diamond fields at Kimberley. He speedily acquired a large fortune, and, with his health well restored, returned to matriculate at Oxford in 1873. From 1876 to 1881 he spent one half of the year at Oxford and at the end of that time took his B.A. and M.A. Early in life Rhodes gave evidence of the blending in him of the materialist and the dreamer. Shrewd in the advancement of his own interests, and not entirely unaffected by the loose ethics of the mining camp, he was possessed at the same time of a profound conviction of the virtues of the British imperial system, and he made it his life plan to extend the sway of the British Empire over South Africa. In 1880 he entered the Cape Parliament; there he directed his efforts toward the establishment of cordial relations between the English and the Dutch in the Colony, and was instrumental in bringing about the annexation of Bechuanaland in 1884. This was a forward step in the extension of British supremacy in South

Africa, and brought the young statesman into contact with the Boer Republic of the Transvaal, whose policy was guided by the ambitious and astute "oom Paul" Kruger, Rhodes's one formidable rival to the end. In 1888 Rhodes obtained from Lobengula, King of the Matabele, the cession of the immense region north of the Limpopo, which speedily came to be known as Rhodesia (q.v.), and in October, 1889, the British South Africa Company was incorporated, with almost full rights of sovereignty over that territory. Rhodes was in fact the sole manager of the company's affairs, and he devoted to the development of the country the resources of the De Beers Consolidated Mines, a corporation controlling the entire diamond industry at Kimberley, organized by Rhodes in 1888.

In 1890 Rhodes became Premier of Cape Colony, retaining at the same time his post as managing director of Rhodesia. He effected much salutary legislation within the Colony, most definitely entered upon the scheme of a British Cape to Cairo railway; found time to crush a formidable insurrection of the Matabeles in 1893; yet found time, too, to play an unscrupulous game of politics in the Transvaal, where the discontent prevailing among the foreign inhabitants of Johannesburg afforded him the opportunity for plotting the overthrow of the South African Republic. The Jameson raid in December, 1895, coming before his schemes were fully matured, was a crushing blow for Rhodes, who now appeared before the world as the instigator of a piratical attempt on the government of a friendly nation. (See TRANSVAAL; and JAMESON, LAMAR STRARR.) He was forced to resign the Premiership of Cape Colony, and for a time his political influence was gone. For the next three years he devoted himself to the affairs of the Chartered Company, suppressed a second insurrection of the Matabeles in 1896-97, and hastened the northward advance of his trans-continental railway and telegraph lines. In 1898 he reentered the Cape Parliament, and had made some progress toward regaining his predominant position in South African affairs, when the Boer war broke out. During the early part of the war he was besieged at Kimberley, where he was attacked by his old illness. He went to Egypt in the early part of 1901, but failing to find health there, returned in February, 1902, to Cape Colony, and died at Cape Town, March 26, 1902. He was buried on his estate in the Matoppo Hills, near Bulawayo, in Matabeleland.

Rhodes's character was the subject of much diverse criticism. By some he was regarded as preëminently a man of money, actuated entirely by selfish motives, and one who for the attainment of his ends did not scruple to plunge South Africa into war. To those of British inclinations he appeared rather as one of the great builders of empire, a descendant of Clive and Warren Hastings. This lineage, in great measure, cannot be denied Rhodes, though there may have been in him also a touch of Sir John Hawkins and Sir Francis Drake. Rhodes's will, by which he left almost his entire fortune for the purpose of educating the Anglo-Saxon youth to the idea of empire, radically modified previously formed estimates upon his character. (See RHODES, SENIOR MEMBERS.) The various biographies of Rhodes naturally are prejudiced to a greater or lesser extent. "Vindex," *Political Life and*

See *Life of Cecil Rhodes* (London, 1900), is eulogistic, but contains much original material; "Imperialism," *Cecil Rhodes, a Biography and Appreciation* (ib., 1897), is favorable and well written. The best life on the whole is that by Hensman, *Cecil Rhodes* (ib., 1902), favorable, but not altogether apologetic. Stead, in the *Review of Reviews* (1902), gives a remarkable study of the psychology of Rhodes.

RHODES, JAMES FORD (1848—). An American historian, born in Cleveland, Ohio, May 1, 1848. He was educated in the public schools and at the universities of New York and Chicago, but he did not graduate, though the degree of LL.D. was afterwards conferred upon him. He was Paris correspondent of the *Chicago Times* (1867-68) and made journeys of industrial investigation in Germany and England, which he continued afterwards in the Southern United States. Then he engaged in business in Cleveland, Ohio, until 1885, when he retired and devoted himself to a *History of the United States from the Compromise of 1850*, a political narrative and analysis of the events growing out of slavery, the Civil War, and the reconstruction era, giving special prominence to Congressional and other political debates and to characterizations of public men, and emphasizing the influence of public opinion. The first two volumes (1892) carry the narrative to 1860; the third (1895) to 1862; the fourth (1901) to the close of the war. He became president of the American Historical Association in 1899 and was awarded an important German prize for his researches. His narrative, although based mainly on Northern sources, is impartial and sober, and is generally considered to be the best work covering the period treated.

RHODES, LAW OF. A code apparently drawn up by the Rhodians at the time of their great naval power in the third century B.C., though it is only known from the references in Roman law. The code was declared binding by Antoninus Pius, in so far as it did not conflict with Roman law, but its provisions are not known, except that "if cargo is thrown overboard to lighten a ship, all must contribute to make good the loss incurred for the benefit of all," a doctrine still accepted in maritime law. The treatise, *Ius Navale Rhodium*, is nothing but a group of mediæval forgeries. See CONSOLATO DEL MARE; OLERON, LAWS OF.

RHODESIA, rōd'zī-ā or rō-dē'shī-ā, NORTHERN. A division of British Central Africa, under the administration of the British South Africa Company. It comprises the territory bounded by the Congo Free State and German East Africa on the north, the British Central Africa Protectorate and Portuguese East Africa on the east, the Zambezi River on the south, and Portuguese West Africa on the west (Map: Congo, E 6). It is divided into Northeastern and Northwestern Rhodesia, the latter being also known as Barotseland. Unlike Southern Rhodesia, Northern Rhodesia has been only slightly explored and is still practically held by the natives. Barotseland or Northwestern Rhodesia is under the rule of King Lewanika, who, however, is advised by a resident of the British South Africa Company. His chief kraal is on the eastern bank of the Zambezi, at Utiui. Gold and coal have been found. Barotseland is well watered and fer-

tile, but its climate is unhealthy. Northeastern Rhodesia is divided into nine districts, with Fort Jameson as the seat of administration. The population of Northern Rhodesia is estimated at about 400,000. The Europeans in Northeastern Rhodesia numbered 165 in 1901.

RHODESIA, SOUTHERN. A British South African protectorate under the administration of the British South Africa Company. It occupies the territory between the Zambezi on the north, the Limpopo on the south, Portuguese East Africa on the east, and the British Bechuanaland Protectorate on the west, comprising the countries of Matabeleland and Mashonaland and the districts of Banyai, Manica, and Makalaka (Map: Cape Colony, H 1). Its area is estimated at 175,000 square miles. The larger part of the country is an elevated veld, well wooded and studded with granite kopjes which attain a considerable height in Mashonaland. The country is well watered by the tributaries of the Zambezi and the Limpopo and is covered with a luxuriant vegetation. The climate is healthful in the elevated districts, which occupy the larger part of the country, but is malarial and oppressive in the valleys of the Zambezi and the Limpopo.

The mineral deposits of Southern Rhodesia include gold, coal, copper, silver, antimony, arsenic, and lead. Gold is found principally in the central part of Mashonaland in the valleys of the Umtali and the Imbesi rivers. The gold deposits of Southern Rhodesia show traces of ancient workings. Their exploitation has been hindered by the lack of transportation facilities and of labor. The total output from 1890 to 1902 amounted to 194,170 ounces. Extensive coal deposits were discovered in 1900 in the Wankies district, in the western part of Mashonaland, and a company has been formed for its exploitation.

Apart from its rich mineral resources, Southern Rhodesia possesses a fertile soil and is well adapted for grazing. From 1890 to 1901 there were surveyed over 18,000,000 acres of land. Good crops of European cereals are raised. But the development of agriculture as well as that of the mineral industries is crippled by the scarcity of labor. Salisbury, the capital, is connected by rail with Cape Colony as well as with Beira, on the coast of Portuguese East Africa. From Bulawayo the line is being extended through the Wankies coal fields to Victoria Falls on the Zambezi and from there it is proposed to continue the road through Northern Rhodesia to Lake Tanganyika. A light railway line has also been completed from Salisbury to the Ayrshire mine in the Lomagundi district. The roads are over 3000 miles long. Salisbury and Bulawayo have been organized into municipalities and are provided with all the institutions of modern cities.

The administration of Southern Rhodesia is vested in the British South Africa Company, but there is also a resident commissioner appointed by the Secretary of State for the Colonies. The executive council is composed of the resident commissioner, the administrators of the company, and not less than four members appointed by the company with the approval of the Secretary of State. The legislative council is made up of the administrator of the company, the resident commissioner, five members appointed by the company, and four members elected by the registered voters, two for each of the provinces of Mashona-

land and Matabeleland. The judges of the High Court are appointed by the Secretary of State from a list submitted by the company. The native affairs are under the control of a secretary who is assisted by native commissioners. The military police of the territory is under the control of the High Commissioner for South Africa. According to an informal census taken in 1904 Mashonaland contained 4021 Europeans, 328,729 natives, and 187 Asiatics; and Matabeleland 7011 Europeans, 162,211 natives, and 996 Asiatics.

In the first half of the nineteenth century the territory now known as Southern Rhodesia was held by the Matabeles, who were forced by the Boers to retreat north of the Limpopo. With the discovery of gold in that part of the continent Cecil Rhodes succeeded in concluding a treaty with Lobengula, under which the chief of the Matabeles bound himself not to enter into any agreement with any power without the approval of Great Britain. In 1880 the mining rights over the territory were also secured by Cecil Rhodes (q.v.) for a consideration of a monthly salary of £100 to Lobengula, 1000 rifles, and a large quantity of ammunition. A royal charter was obtained for the British South Africa Company in 1889, and a considerable military force was sent to explore the interior of the country. An uprising of the Matabeles in 1893 ended in the overthrow of Lobengula and the formal annexation of Matabeleland. A more serious uprising occurred after the withdrawal of the white police to Bechuanaland, in 1896. The rebellion soon spread to Mashonaland, and it was only with the assistance of troops dispatched from Natal and Mafeking that peace was restored in 1897.

BIBLIOGRAPHY. Gresswell, *Geography of Africa South of the Zambezi* (London, 1893); Keane, *South Africa* (ib., 1895); Kellie, *Partition of Africa*, contains bibliography (ib., 1895); Thomson, *Rhodesia and Its Government* (ib., 1898); Dawkins, *Précis of Information Concerning Southern Rhodesia*, with bibliography (n.p. 1899); Hall and Neal, *The Ancient Ruins of Rhodesia* (New York, 1902).

RHODES SCHOLARSHIPS, THE. A number of stipends established under the will of Cecil John Rhodes (q.v.), who died in 1902, bequeathing a large part of his estate in trust for the purpose of maintaining a certain number of British, American, and German students at Oxford University, in the belief that "a good understanding between England, Germany, and the United States will secure the peace of the world, and that educational relations form the strongest tie." The founder suggested the following basis for awarding these scholarships: (1) Proficiency in literary and scholastic attainments, which was to count three-tenths; (2) success in outdoor sports, two-tenths; (3) qualities of manhood, etc., three-tenths; (4) qualities of leadership, two-tenths. Qualifications second and third were to be decided upon by a vote of the fellow students, first and fourth by the masters of the respective schools where candidates prepare. The number of scholarships to be thus distributed are as follows: Rhodesia, 9; Cape Colony, 12; Natal, 3; Australia, 18; New Zealand, 3; Canada, 6; Newfoundland, 3; Bermuda, 3; Jamaica, 3; two to each State and Territory of the United States, and 15 to Germany. The annual value of the Colonial and American scholarships is

£300, payable for three years. Only one-third of the Colonial and one-half of the American scholarships are to be filled each year. The disposal of the German scholarships is at the pleasure of the Emperor.

In the United States the first qualifying examination, based on the Oxford Regulations, or the first Oxford public examination, was set down for 1904, and was to consist of Latin, Greek, and elementary mathematics. These examinations are to be held under the auspice of the State committees designated by the trustees for selecting suitable candidates for the scholarships. The chairmen of these committees are either the presidents of the State Universities, as in the case in most of the Western and Southern States, or the Presidents of certain prominent universities, as is the case in most of the New England and Eastern States. In California, Maine, Vermont, and Washington, appointments are to be made by the several chartered universities and colleges in rotation. Candidates must be from 20 to 25 years of age and must have attended two years at a recognized institution of higher learning. Scholars must be unmarried and citizens of the United States.

RHODIUM (Neo-Lat., from Gk. *ῥόδιος*, rose-like, from *ῥόδον*, *rhodon*, rose). A metallic chemical element that was discovered by Wollaston in 1804. It occurs with other members of the platinum group and alloyed with gold as "rhodium gold," or *rhodite*, a mineral found in Mexico. The element is separated by adding iron to the mother liquors from which platinum has been extracted. The precipitate thus obtained is fused with lead and litharge, after which lead, copper, and palladium are removed by dilute nitric acid, and the residue heated with barium dioxide, then washed and distilled with aqua regia to remove osmium. The remaining solution contains the rhodium, which is then isolated by a somewhat complicated process.

Rhodium (symbol, Rh; atomic weight, 103.01) is a white, hard, malleable metal that fuses at about the same temperature as platinum, and absorbs oxygen like that metal. It combines with oxygen to form a monoxide, a sesquioxide, a dioxide, and probably a trioxide. The metal itself, when added in small quantities to steel, is said to form an alloy that has exceedingly valuable properties.

RHODODENDRON (Neo-Lat., from Gk. *ῥοδόδενδρον*, oleander, from *ῥόδον*, *rhodon*, rose + *δένδρον*, *dendron*, tree). A genus of about 200 trees and shrubs, including *Azalea* (q.v.), of the natural order Ericaceæ. The species of *Rhododendron* proper have evergreen leaves, and many of them are of great beauty both in foliage and in flower. They vary in size from a few inches in height to trees 50 to 60 feet high and 18 inches in diameter. A few small species are natives of Continental Europe and of Siberia, but the greater number are found in temperate North America, and in the mountains of India. *Rhododendron molle*, so designated when the far larger Indian species were unknown, is a common American ornamental shrub or small tree which forms impenetrable thickets in the Alleghany Mountains, and is magnificent when in flower. The flowers are large, in umbellate corymbs, varying in color from pale carnine to lilac. *Rhododendron ponticum*, a very

similar species with narrower and more pointed leaves, of the same color on both sides, is a native of Western Asia, and apparently also of Southern Spain. *Rhododendron catachiense*, a native of the southern Alleghanies, with large purple flowers, and *Rhododendron arboreum*, a native of Nepal, with very dense heads of large scarlet flowers and leaves 12 to 18 inches long, attaining a height of 30 to 40 feet in its native

RHODODENDRON (*Rhododendron ponticum*).

country, are fine and well-known species; *Rhododendron Californicum* and *Rhododendron macrophyllum* are among the most conspicuous species of the Pacific Coast region. Most of the extremely numerous varieties common in gardens and shrubberies have been produced from them. In many if not most of the hybrids, *Rhododendron Catachiense* enters, and in a list published in 1871, 250 named hybrids of this species are mentioned. Since that time the number has undoubtedly greatly increased.

Many splendid species of *Rhododendron* have been discovered in the Himalaya, the Khasia Hills, and other mountainous parts of India, by Hooker and others; and some of them have been introduced into cultivation. *Rhododendron grande* has very beautiful flowers $4\frac{1}{2}$ inches in diameter. *Rhododendron Maddeni*, *Rhododendron Griffithianum*, *Rhododendron Edgeworthii*, and others have white flowers. *Rhododendron Dalhousii* is remarkable as an epiphyte, growing on magnolias, laurels, and oaks. It is a slender shrub, bearing from 3 to 6 white lemon-scented terminal bells, $4\frac{1}{2}$ inches long. *Rhododendron Nuttallii* has fragrant white flowers, said to be larger than those of any other species. All these belong to the Himalayas. In more southern latitudes, as on the Nilgherry Hills and on the mountains of Ceylon, *Rhododendron barbatum* prevails as a timber tree, a blaze of crimson when in flower. *Rhododendron Kaysii* and *Rhododendron cinnabarinum*, natives of Northern India, have flowers with nearly tubular corollas. *Rhododendron ferrugineum* and *Rhododendron hirsutum* are small Alpine shrubs from 1 to 3

feet in height with umbellate clusters of carmine-colored flowers among the finest ornaments of alpine scenery. They are called *alpenrose* (alpine rose) by the Germans, and are not easily cultivated in gardens. The flora of the Himalaya contains a number of similar small species. *Rhododendron sciosum*, a dwarf shrub with strongly scented leaves, clothes the mountains in Eastern Nepal at an elevation of 12,000 feet and upward, with a green mantle, brilliant with flowers in summer. *Rhododendron nivale* is the most alpine of woody plants, spreading its small woody branches close to the ground, at an elevation of 17,000 feet in Sikkim. *Rhododendron lapponicum*, a procumbent shrub, with small flowers, grows as far north as human settlements have reached in Europe and Asia. An oil obtained from the buds of *Rhododendron ferrugineum* and *Rhododendron hirsutum* have been used by the inhabitants of the Alps under the name *olio di marmotta*, as a remedy for various ailments. The flowers of *Rhododendron arboreum* are said to be eaten in India, and Europeans make a jelly of them. The wood of some of the larger species is white, hard, and close-grained, and has been recommended as a possible substitute for boxwood. *Rhododendrons* are not of difficult culture, a soil containing plenty of leaf mold and protection from drought and winter scalding being the prime necessities for growing the hardier species in shrubberies and parks. See Colored Plate of AZALEAS AND RHODODENDRONS.

RHODONITE (from Gk. *ῥόδον*, *rhodon*, rose).

A mineral manganese silicate that crystallizes in the triclinic system, has a vitreous lustre, and is usually red, although sometimes green or yellow. It occurs frequently in association with iron and zinc ores, and is found in Sweden, the Harz, the Urals, and in the United States at various localities in Massachusetts, and in Sussex County, N. J., where part of the manganese is replaced by zinc, giving rise to a variety known as *fourcrite*. The massive varieties of this mineral, especially those found in the Ekaterinburg District in the Urals, are used for ornamental purposes, as for table tops, etc., while varieties from other places are used to a limited extent as gems.

RHODOPHYCEÆ (Neo-Lat. nom. pl. from Gk. *ῥόδον*, *rhodon*, rose, + *φύκος*, *phykos*, seaweed). The red algae. The most beautiful of the four great groups of algae. Some are very complex in structure, but in general they show less vegetative differentiation than do the brown algae (Phaeophyceæ, q.v.). Their peculiarities lie chiefly in a highly developed method of sexual reproduction, resulting in a complex fruit (cystocarp), which contains the carpospores. (Figs. 1, 2.) The male cells (spermatia) are non-motile, and fuse with a thread-like female receptive organ (trichogyne). There is also a form of asexual reproduction generally of four special spores (tetraspores). (Fig. 1.) Most Rhodophyceæ are red or reddish brown, a color due to a peculiar pigment (phycoerythrin) which obscures the green pigment (chlorophyll).

The form of the body ranges from minute filaments of great delicacy to broad membranes and thick cartilaginous fronds. Some of the membranous forms are several feet long (Delesseria), and may be differentiated into a stem and leaf-like out-growths. Others form filamentous branching tufts (Callithamnion, Dasya). Some groups bear

protruding fruits resembling urns (Polysiphonia, Fig. 2), others are pinnately branched (Ptilota), others with incurved tips (Cerami-

Pennisetum (Leipzig, 1887 et seq.); Murray, *Introduction to the Study of Seaweeds* (London, 1895).

FIG. 1. RED ALGÆ.

1, *Nemalion*, sexual branches, showing antheridia (*a*) and carpogonium (*b*) with trichogyne to which two spermatia are attached, beginning of a cystocarp (*c*), and an almost mature cystocarp (*d*); 2, *Callithamnion*, showing sporangium (*a*) and three discharged tetraspores (*b*).

um). Most of the filamentous and membranous species, especially those which grow in quiet waters, are very delicate.

Many forms on surf-beaten coasts develop large and strong cartilaginous fronds. Several of these firmer forms yield a jelly when placed in hot water; for instance, agar-agar is derived from species found in Ceylon, Java, and Madagascar, and *Chondrus crispus* furnishes most of the 'Irish moss' used in cookery. These preparations consist mainly of mucilage of little or no nutritive value, derived from intercellular spaces and swollen cell-walls.

FIG. 2. POLYSIPHONIA.

Showing branching, a cystocarp (*a*), and escaping spores (*b*).

Perhaps the most remarkable group of the Rhodophyceæ is the Corallines, with highly specialized fructifications and tetraspores borne in differentiated conceptacles. Some are branched, with jointed segments, others have the form of convoluted nodules. They are so incrustated and pervaded with lime as to resemble coral.

Perhaps the most remarkable group of the Rhodophyceæ is the Corallines, with highly specialized fructifications and tetraspores borne in differentiated conceptacles.

RHODOPIS (Lat., from Gk. Ῥοδωπισ), A famous Greek courtesan, a native of Thrace. At one time she was a fellow slave of the poet Æsop. Later she was carried to Naucratis, in Egypt. While she plied the trade of hetæra there Charaxus, brother of Sappho, fell in love with her and ransomed her at a great price. She was attacked by Sappho in a poem. After her liberation she continued to reside in Naucratis.

RHOMBOID. See PARALLELOGRAM.

RHOMBUS. See PARALLELOGRAM.

RHONDDA, ρονδλά. An important and populous coal mining district, now a municipality of Glamorganshire, Wales. It is situated amid picturesque valley scenery on the Rhondda River, near Merthyr Tydfil. Population, in 1891, 88,350; in 1901, 113,700.

RHONE, ρόν (Fr. *Rhône*; Lat. *Rhodanus*). The principal river of Southeastern France. It rises at an altitude of 7,530 feet in the Rhone Glacier on the south slope of the Dammastock, a peak of the Urner Alps in South Central Switzerland (Map: France, I, 7). It flows first in a general southwest course through Southern Switzerland and into France as far as Lyons, then due south until it empties into the Gulf of Lyons in the Mediterranean Sea, 25 miles west of Marseilles. Its length is 504 miles. Its upper course is through the great valley lying between the Bernese and the Pennine Alps, which forms the Swiss Canton of Valais. Here it grows rapidly by taking up a number of short but voluminous mountain torrents fed by the great glaciers which cap the mountain ranges on either side. At Martigny the valley is narrowed and the river makes a sharp turn to the northwest, becomes then navigable below Saint-Maurice, and enters the eastern end of Lake Geneva. It leaves the lake at its western end at Geneva, resuming its southwest direction, quits Swiss territory, and soon after passes through the Jura Range in a deep and narrow gorge, where its width is decreased from 350 to 25 yards. Here it formerly disappeared through a subterranean channel known as the Porte du Rhône, but the rocks which covered it were removed in 1828. After leaving the gorge it becomes again navigable, and remains officially so to its mouth.

Its fall from Lyons to the sea, a distance of 208 miles, is over 500 feet, or 2½ feet per mile. Its course below Lyons lies in a broad, fertile, and beautiful valley between the Alps and the Cévennes. It receives here two large tributaries, the Isère and the Durance, the latter joining it at Avignon, below which town the river flows through a sandy and arid tract which was formerly a gulf of the sea. Its delta, whose main arms are the Grand and the Petit Rhône, which form the *He de la Camargue* (see *BOUCS DE RHONE*), is growing at the rate of nearly 200 feet annually, owing to the large quantities of sediment carried by the stream. The navigation of the Rhone, owing to the swift current, the shifting of the bed, and the numerous islands, is very difficult even for steamers, and especially on the upstream route. Extensive regulating works, here to some extent improved the waterway above the delta, and the shifting and sand-barred mouth of the latter have been obviated by a short canal

Consult: Engler and Prantl, *Die natürlichen*

runnel from the Gulf of Foz to the main stream, while other canals connect the latter with several ports on the Gulf of Lyons, one being projected to the port of Marseilles. Canals also connect the Saône with the Loire, the Seine, and the Rhine.

Consult: Barron, *Les fleuves de la France; Le Rhône* (Paris, 1900); Lenthéric, *Le Rhône, histoire d'un fleuve* (ib., 1892); Wood, *In the Valley of the Rhone* (London, 1899); Lombard-Gerin, *Votes sur le tonnage du Rhône* (Paris, 1900).

RHÔNE. A southeastern department of France (Map: France, L. 6). Area, 1077 square miles. It lies almost wholly in the basin of the Rhone and its great affluent the Saône, its eastern boundary being formed by these rivers. The surface is almost entirely mountainous or hilly, the chief level stretches being the valley of the Saône and the district about Lyons. The principal productions are wine and silk. The wines are famous for their excellent quality. About one-tenth of the surface is in vineyards. Silks are manufactured extensively, and numerous other branches of manufacture are actively carried on. Capital, Lyons (q.v.). Population, in 1896, 839,239; in 1901, 843,179. Consult: Varnet, *Géographie du département du Rhône* (Lyon, n. d.); Lenthéric, *La région du Bas-Rhône* (Paris, 1881); Joanne, *Géographie du département du Rhône* (ib., 1900).

RHÔNE, BOUCHES-DU-. A department of France. See BOUCHES-DU-RHÔNE.

RHUBARB (ML. *rhubarbarum*, *rheubarbarum*, *reubarbarum*, *rheum barbarum*, from Gk. ῥῆον *rhônon*, *rhubarb*, from ῥῆον, *rhéon*, *rhubarb*, and βάρβαρος, *barbaros*, barbarous, foreign), or PIE PLANT (*Rheum*). A large, coarse genus of Asiatic herbs of the natural order Polygonaceæ, closely allied to *Rumex* (dock and sorrel). The rhubarb of commerce, which comes from inland parts of China or Chinese Tartary, is produced by an unknown species.

The leafstalks of rhubarb contain an agreeable mixture of citric and malic acids, and when young and tender are highly esteemed for stewing and preserving, for which purpose the plants are widely cultivated in temperate and cold countries. Several species have been introduced into cultivation for their leafstalks. *Rheum palmatum*, the first species known, and once believed to yield Turkey rhubarb, has roundish green leafstalks and half-palmate leaves. Its stalks are inferior for the table. *Rheum undulatum*, *Rheum rhoponticum*, and *Rheum hybridum* have broad, heart-shaped, undivided leaves, upon flattened, often reddish leafstalks grooved on the upper side. In some of the finest varieties the flesh is red. In Continental Europe rhubarb is grown more as a foliage plant than as a vegetable. Rhubarb is propagated by seed, or by dividing the roots. It prefers a light rich soil, which should be heavily manured every year. The plants are placed three or four feet apart, according to the size of the variety. Rhubarb is forced in winter and early spring by having pots or barrels inverted over it, and fresh litter or horse manure heaped around. It is also forced under greenhouse benches and in cellars, the roots being frozen before removal to the heat. As a medicine rhubarb roots are considered to be cathartic, astringent, and tonic. See PLATE OF VEGETABLES.

RHUMB LINE, or LOXODROMIC LINE. The course of a ship which is sailing in an oblique direction always to one point of the compass. It is a curve on the surface of the terrestrial sphere which has the property of cutting all meridians at the same angle. The rhumb line appears as a straight line on Mercator's projection. (See MAP.) A ship sailing obliquely to the direction of the North Pole (say, two points off) would wind round it in infinite circuits, always approaching nearer, but never reaching it. In this property, as well as in others, the loxodromic line is analogous to the common logarithmic spiral. See LOXOBROME; NAVIGATION; SAULINGS.

RHUS. A genus of shrubs and trees. See SUMACH; POISONOUS PLANTS.

RHYL, ril. A popular tourist and sea-bathing resort in Flintshire, Wales, at the mouth of the Clwyd, 10 miles northwest of Denbigh (Map: Wales, C 3). It has a fine beach, esplanade, promenade pier, aquarium, and winter garden, golf links, etc. Zinc ore is mined in the vicinity. Much municipal activity has been evinced in public improvements to add to the natural attractions. The town owns its water-works, gas, and electric lighting plants, markets, and cemetery; maintains promenades, marine walks, and recreation grounds; and has installed modern sewage disposal works. Population, in 1891, 6500; in 1901, 8500, with a transient summer population of 20,000.

RHYME, or RIME (AS., OIG, *rîm*, number, Ger. *Reim*, rhyme). In the broader meaning, a poem, or numbered or versified composition, as when we speak of the "Mother Goose Rhymes;" also, by a slight extension, a synonym for poetry in general. In the more technical sense rhyme is the recurrence of the same sound, in a verse or verses, in syllables having corresponding metrical values. Rhymes are of three general types: they may be formed by the correspondence of the initial sounds of the rhyming syllables, in which case they are called head-rhyme or alliteration; they may be formed by the correspondence of the vowel element, in which case, if the succeeding consonant sounds differ in the rhyming syllables, we have assonance, while if the succeeding consonants are the same in sound, or if there are no consonants, we have true rhymes. Alliteration was the characteristic rhyme of the ancient Teutonic poetry, while assonance was first systematically developed in the early Romance literatures. In modern literature both of these types have yielded in large measure to the more perfect music of the true rhyme, but they have not, as is sometimes stated, ceased to be in good form. Most commonly, in modern poetry, they are used in connection with rhyme. Thus, in *The Symphony*, Sidney Lanier combines rhyme and alliteration:

Woe him that cunning trades in hearts contrives!
Base love good women to base living drives.
If men loved larger, larger were our lives;
And noosed they nobler, iron they nobler wives.

And in the same poem rhyme and assonance are combined in:

Vainly might Plato's brain revolve it;
Plainly the heart of a child could solve it.

The placing of rhyming words in the verse structure varies with the different kinds or with varying types of verse-composition. Alliteration is characteristically complete in a single verse,

and in Anglo-Saxon poetry usually consisted of a three-fold repetition of the alliterated sound, as in the third and fourth lines of the first quotation above given. End-rhymes, on the other hand, may be completed within a single verse, but are ordinarily between two or more verses, the number being determined by the stanzaic structure or the taste of the poet; in the rondeau, for instance, one rhyme is repeated eight times and the other five. Not infrequently poems are constructed having both styles of rhyme, as in Shelley's *Cloud*:

I bring fresh showers for the thirsting flowers,
From the seas and the streams;
I bear light shade for the leaves when laid
In their noonday dreams.

Rhymes, of whatever sort, are in modern poetry always placed upon accented syllables, and end-rhymes are characteristically placed either at the end of the verse or at the end of the colon, as in the first and third verses here given. They may, however, be placed elsewhere, even at the beginning of the verse, as in the second citation from Lanier's *Symphony*. In complicated structures they are often used with less regard to regularity, internal rhymes being carried on in verse endings, or placed within the verse itself without regard to caesural pauses. In general, however, internal rhymes irregularly placed convey an effect of assonance rather than of true rhyme, and many poets make use of assonance in preference to it, when so placed. As to the relation of rhyming verses, this is determined either by the form of the stanza or in non-stanzaic rhymed composition by some set order, as the couplet, which the poet may determine, or again the rhymes may occur irregularly. Stanzas are of indefinite variety, and the poet is at liberty to invent whatever forms may please his ear.

Not all languages agree as to the nature of the adequate rhyme. In English, words which rhyme perfectly must agree in all the sound elements succeeding the initial element of the last accented syllable, and in this element they must differ. In French, on the other hand, such a rhyme is only *suffisante*, the *riche* or perfect rhyme having identical *all* the elements in the rhyming syllables. Thus, *grows* and *rose* form a perfect rhyme in English, *rose* and *arrose* in French. Rarely in English an identical rhyme is used provided the sense be changed, as *reign* with *rein*, *to* with *tor* (change of sense is also always necessary in French), but the change must be more than a mere negation; in no case should *close* and *disclose* be rhymed, nor words having the same root, as *compute*, *dispute*. When a word is repeated to rhyme with itself, as is frequently the case in Poe's poems, for example, it has the value of a refrain rather than of a true rhyme, and in all such cases there should be at least one other word rhymed with it. There are a few words in English the pronunciation of which may be altered to suit the needs of rhyme; thus, *wind* (noun) may be rhymed with *blind*, etc., but this is only a form of poetic archaism, reverting to the original pronunciation of the word. Rhymes are 'masculine' and 'feminine'; masculine when the rhymed syllable is also the chief accent of the word, *arar*, *deter*; *mar*, *tar*; feminine when it is followed by unaccented syllables, *marry*, *tarry*; *tenderly*, *slenderly*. Sometimes a secondary accent is made to carry the rhyme, but in such cases it is generally rhymed

with a word having no great rhetorical stress or having other words rhymed with it. The use of feminine rhymes is the less common in English, and they are never to be found in the complicated form to be met with in some other languages. (Compare the Persian under RHYTHM.) They occur most freely in satirical verse, which often takes liberties with rhyme that no serious poetry could tolerate. An example from Lowell is:

Though you be a native of New World, you don't
Hate to have me go;
And as mine own is the best possible, we've but

Rhyme was of relatively slight value in verse which depended upon quantity rather than accent and in languages which abounded in elaborate inflections. It was not until the classical Latin gave way to the vulgar speech that rhyme became the rule, first in the early hymns of the Christian Church. It is possible that an ancient Celtic influence may have aided this development, since the Celts used rhyme in the oldest Celtic poetry preserved to us. Rhyme was elaborately developed among the Persians and Arabs of mediæval times, but it is not known from what influence it was derived. It seems most probable that the simple repetitions, in which most primitive poetry abounds, form the basis from which rhyme naturally arises. Consult: Corson, *Primer of English Verse* (Boston, 1893); Gummere, *Handbook of Poetics* (Boston, 1895); Schipper, *Englische Metrik* (Bonn, 1881-88).

RHYNCHOCEPHALIA, *rin'kô sô-fa'li à* (Neo-Lat. nom. pl., from Gk. *ῥίγχος*, *rhynchos*, snout + *κεφαλή*, *kephalê*, head). An order of primitive reptiles, represented in modern times by a single survivor, Sphenodon or Hatteria, which lives on islands off the coast of New Zealand, and in ancient times by a large number of creatures whose fossil remains are found in Permian, Mesozoic, and Eocene rocks. This order received its name from the beak-like rostrum on the skulls of some of its typical species. It includes the earliest and most primitive reptiles, and also the birds. The suborder Proterosauria,

RHYNCHOCEPHALIA
1, Skull of Paleohatteria, superior aspect; 2 the same, lateral aspect; 3, a dorsal vertebra of Aissourius chrygeryi, c, centrum; j, jugal; m, maxilla; q, quadrate bone.

or Progamosauria, includes the most primitive forms, in which the teeth are of uniform shape and parts of the skeleton are still cartilaginous. Paleohatteria from the Lower Permian of Saxony is the earliest known reptile. It had a lizard like body about 18 inches long, with a long tail, large eyes, and numerous large conical teeth that are fused with the jaw bones, and also small teeth on the palate. The

legs were strong and the feet were provided with five clawed toes and adapted to progress on land.

A suborder, Polycosauria, includes several curious though imperfectly known genera in which the anterior teeth are different from the posterior and the dorsal vertebrae are furnished with greatly elongated neural spines. The *Rhyncho-*

THE RHYNCHOCEPHALIC SKULL.

Cranium of *Hyperodapedon Gordoni*: 1, superior aspect; 2, lateral aspect; 3, mandibular symphysis.

cephalia vera includes the most highly specialized forms, which attain their maximum of evolution and widest geographic distribution in late Triassic time. They are characterized by more complete ossification of the skeleton, by reduction of the abdominal ribs, and by having uniform marginal teeth.

BIBLIOGRAPHY. Von Zittel and Eastman, *Text-book of Palaeontology*, vol. ii. (London and New York, 1902).

RHYNCHONEL/LA (Neo-Lat. nom. pl., from Gk. ῥύγχος, *rhynchos*, snout). A genus of brachiopods, scarce but widespread in modern seas, but very abundant anciently, and represented in almost every geological formation from the Ordovician upward. About 600 species have been described, mostly from the Mesozoic rocks, of which the Jurassic and Cretaceous groups are especially prolific. Most of the ancient forms are doubly convex shells with prominent though small ventral beaks, and with surfaces marked by strong, usually angular radial plications, and with a more or less elevated median fold and sinus. The structure of the shell in most genera is non-punctate, a character by which the species may most readily be distinguished from the closely similar species of *Terebratulida*. Consult: Hall and Clarke, *Palaeontology of New York*, vol. viii., part ii. (Albany, 1894); Davidson, "Monograph of the Recent Brachiopoda," *Transactions of the Linnean Society*, vol. iv. (London, 1886-88).

RHYOLITE (from Gk. ῥοαῖ, *rhya*, stream, especially of lava, from ῥέω, *rhein*, to flow + λίθος, *lithos*, stone). **LIPARITE, NEVADITE.** An igneous rock of porphyritic texture and siliceous composition, generally with a crumpled, banded (rhyolitic) texture, due to the arrangement of its constituent minerals by flowage. Rhyolites are also frequently glassy, vesicular, scoriaceous, or pumiceous. When compact and massive, rhyolites are designated as rhyolite porphyries (formerly called quartz porphyries, and then supposed to be of geological age older than the Tertiary). In chemical composition rhyolites have about the same range as the granites. They average: Silica, 75 per cent.; alumina, 13 per cent.; sesquioxide and protoxide of iron, each 1 per cent.; oxide of lime, 1 per cent.; oxide of sodium, 3 per cent.; oxide of potassium, 6 per cent. Varieties rich in oxide of sodium are designated soda-rhyolites

(pandellerites). Rhyolites are for the most part surface lavas or are intruded in other rocks as dikes or sills. Very extensive areas of rhyolite are found in the Cordilleran mountain system of the Western Hemisphere. Rhyolites when of unusually coarse grain are now designated by the variety name, Nevadite.

RHYS, **rēs, ERNEST** (1859—). An English author, born in London, July 17, 1859. He was educated at schools in Carmarthen, South Wales, at Bishop-Stortford and at Newcastle-on-Tyne, and became a mining engineer (1877). In 1885 he abandoned the profession for general literature. In 1887 he came to the United States on a lecturing tour. His writings on Welsh subjects are popular and are to be distinguished from those of the profound Celtic scholar John Rhys (q.v.). He edited the Camelot series of popular reprints and translations (65 vols., 1886-91); Dekker's *Plays for the Mermaid Series* (1888); *The Lyric Poets* (12 vols., 1894-99); *Literary Pamphlets* (1897); and other works. His writings include: *The Great Cockney Tragedy* (1891); *A London Rose and Other Rhymes* (1894); *Welsh Ballads and Other Poems* (1898); *Frederick Lord Leighton*, a biography (1898, which had been preceded by an earlier study in 1895); and two romances, *The Fiddler of Carne*, having a Welsh heroine (1896), and *The Whistling Maid* (1900).

RHYS, JOHN (1840—). A Welsh author and professor of Celtic at Oxford since 1877. He was born in Cardiganshire in 1840 and educated at Bangor Normal College, Jesus College, Oxford, the Sorbonne, Heidelberg, and Leipzig. In 1871 he became school inspector for Flintshire and Denbighshire; fellow of Jesus College in 1881; Hibbert lecturer, 1886; Rhind lecturer on archaeology in Edinburgh, 1889; and has seen service on numerous commissions on education, reforms and land movements connected with Wales. His works are: *Lectures on Welsh Philology* (1877); *Celtic Britain* (1882); *Celtic Heathendom* (1886); *Studies in the Arthurian Legend* (1891); *Inscriptions and Language of the Northern Picts* (1892); *Rhind Lectures on the Early Ethnology of the British Isles* (1890-91); *Celtic Folk-Love* (1901); and in conjunction with Mr. D. Brynmor-Jones, *The Welsh People* (1900). Professor Rhys has also cooperated in the production of several important editions of Welsh texts and his contributions to Celtic scholarship have been various and important. To his native and unsurpassed knowledge of Wales and of the Welsh language he has added wide research in the other languages of the Celtic group, and in the history and antiquities of the Celtic peoples. Besides doing valuable linguistic work in early Welsh and Manx, he has made himself the chief living authority on the Ogam inscriptions. His studies on folk-lore, mythology, and religion have been learned and brilliant, but rather bold in conjecture. The editions of Welsh texts which he has brought out in collaboration with Professor Morris Jones and Mr. J. Gwenogvryn Evans are models of accurate editing.

RHYTHM (Lat. *rhythmus*, from Gk. ῥυθμός, *rhythmos*, rhythm, time, measure, from ῥέω, *rhein*, Skt. *ru*, to flow). A complex mental process which has been defined, from different points of view, as a temporal perception and as a regulated emotion. Objectively regarded, it is a regularly measured and regularly stressed movement in

time. Regarded as perception, it is a series of auditory or tactual (never of visual) sensations, which recur at regular intervals and show a regular variation of intensity. In other words, our interpretation of rhythm as a perception simply translates the objective definition into subjective terms. There are, however, certain phenomena of the rhythmical consciousness which have led some psychologists to accept the other view, that rhythm is a kind of emotion. (1) If we subject an observer to a series of regularly recurring and similar sounds, we find (within definite time limits) that in the majority of cases the series is apprehended as rhythmical. The most familiar instance is that of listening to the ticking of a clock; the beats of the pendulum are heard, not as tick, tick, tick, but as *tick, tick, tick, tick*, etc. (2) We can produce the effect of rhythm not only by changing the objective intensity of regularly recurring stimuli, but also (a) by changing their duration, (b) by changing the interval between them, and (c) by changing their quality. That is to say, the intensities may remain constant throughout, and yet (if some one of these three variations is introduced into the series) the observer will have the illusion of intensive fluctuation, and will therefore be constrained to hear the series as rhythmical. (3) There is a strong tendency to 'express' rhythm, to accompany a

first beat of every bar has an accent, while in examples 2 and 3, although every bar retains its own accent, there is no special accent or emphasis at the beginning of the rhythmic figure. Accent thus deals with the notes of a single measure; rhythm with groups of notes extending over one or (generally) more measures. Music becomes intelligible only when these larger rhythmic divisions are clearly grasped. A cultivated ear soon tires of constant regularity of rhythm. To avoid monotony, composers resort to various means of breaking the rhythm, such as inserting an odd bar between the regular number of bars composing a rhythmic group, alternating two bar with three-bar rhythms, or making the weak ending of a phrase coincide with the strong beginning of a new phrase (thus really causing the elision of a bar).

The only simple rhythms are those consisting of a group of notes filling two or three measures (duple and triple rhythm). All rhythm extending over more than three bars are compound. Thus every four bar rhythm can be resolved into two groups of two bars each. A six-bar rhythm may consist of two groups of three bars each or three groups of two bars each. The Scherzo of Beethoven's *Ninth Symphony* (Ex. 4) begins with a theme in quadruple rhythm (two groups of duple rhythm).

Example 4.

series of rhythmical sounds by movements of head, foot, or hand.

RHYTHM IN MUSIC. The regular recurrence of tone-groups in which the individual notes are symmetrically arranged according to accent and time-value. Rhythm is entirely independent of melody or harmony (q.v.) and can, therefore, be indicated by notes without reference to pitch.

While every bar retains its own accent (marked —), there is a particular emphasis (marked =) upon the first and fifth bars (the beginnings of the rhythmic group) and a less emphasis (marked =) upon the third and sixth bars. The effect produced is the same as if the phrase were written in more moderate tempo as follows:

Example 5.

The following examples illustrate this:

After a number of bars Beethoven changes this

Example 1.—POLONAISE, 3/4

figure is contained within the limits of a single

which produces the following effect:

Example 7.

measure; whereas in the other two examples it fills two measures. It is evident from this that rhythm is not synonymous with accent; for the

A loose use of language has created a great deal of confusion in regard to the meaning of the term rhythm. The word is often carelessly

instead of *accut* or *time*, both of which are only subdivisions of rhythm. See AC-SYNCOPE; TIME.

RIAD, *riād'*, or **RIYAD**. The Wahabi capital in the Sultanate of Nedjed, Central Arabia (Map; Turkey in Asia, R 11). It is built on an extensive open plain in a well-cultivated region. In the centre of the city is a large square containing the market-place and the great mosque. The city is a resting-place for pilgrims on the way from Persia to Mecca and Medina. Riad dates from 1824. Population (estimated), 30,000.

RIALL, *ri'äl*, SIR PHINEAS (1775-1851). A British soldier. He was born in Ireland, entered the British Army as an ensign in 1794, and soon rose to be major. In 1804 he was attached to the Fifteenth Foot, served for several years with distinction in the West Indies, and in 1810 was brevetted colonel. Three years later he was promoted major-general, and was sent to Canada to operate against the forces of the United States. In the following winter he destroyed Black Rock, Buffalo, and other villages on the American border, and during the next summer commanded the troops which opposed the invading army under General Jacob Brown. On July 5th he was defeated in the battle of Street's Creek, or Chippewa. On July 25th at the battle of Lundy's Lane (q.v.), where he held the immediate command of the British forces, he was severely wounded and was taken prisoner. In 1816 he was appointed Governor of Grenada, and administered the affairs of that island for several years. He was promoted lieutenant-general in 1825, was knighted in 1833, and was made a full general in 1841. Consult Morgan, *Sketches of Celebrated Canadians and Persons Connected with Canadian History* (Quebec, 1862).

RIALTO, *riäl'tö* (It., from *rio*, *rivo*, brook + *alto*, deep, high). The chief bridge of Venice, a graceful structure spanning the Grand Canal by a single marble arch 74 feet in length, and 32 feet high. The name is derived from Rivoalto, the island on which Venice was founded. Two rows of shops divide the bridge into a broad road and two narrow side passages. The bridge and adjacent district are referred to in Shakespeare's *Merchant of Venice*.

RIANT, *riän'*, PAUL EDUARD DIDIER, Count (1836-88). A French scholar and historian, born in Paris. He was known as the foremost scholar of his day on the subject of the Crusades, possessed of a keen historical sense, skill in research, and marked scholarship in the interpretation of documents. In 1875 he founded the Société de l'Orient Latin, whose object was the publication of geographical and historical documents appertaining to the Crusades and Palestine. He collected an excellent library in the history of the Crusades, and in Scandinavian literature, of which Harvard University obtained the former portion, and Yale the latter. Among the numerous volumes written and edited by him are *L'expédition et pèlerinage des Scandinaves en Terre Sainte au temps des croisades* (1865); *Monisti Thodet Neapolitani Hystoria de Desolation et Conurbatione Civitatis Aconensis 1291* (1874); and *L'échouement de direction de la quatrième croisade* (1878). The *Catalogue de la bibliothèque de S. M. le comte Riant* appeared at Paris in 1896-99 (3 vols.).

RIAZAN, *ri'ä-zän'y'*. A government and a city of Russia. See RYAZAN.

RIB (AS. *ribb*, OIG. *rippi*, Ger. *Rippe*; connected with OChurch Slav. *rebro*, rib, and probably with Ger. *Rebe*, tendril, OIG. *hirnreba*, brain covering, skull). An elastic arch of bone, which, with its fellows, constitutes with the vertebral column behind, and the sternum or breast-bone in front, the osseous part of the walls of the chest. In man there are 12 ribs on each side. The first seven are more directly connected through intervening cartilages with the sternum than the remainder, and hence they are termed *vertebro-sternal* or *true* ribs; while the other five are known as *false* ribs, and the last two of these, from being quite free at their anterior extremities, are termed *floating* ribs. A glance at a skeleton, or at a plate representing the articulated bones, will show that the ribs vary very considerably both in their direction and size. The upper ribs are nearly horizontal, but the others lie with the anterior extremity lower than the posterior, this obliquity increasing to the ninth rib, and then slightly decreasing. They in-

FIG. 1. THORAX, FRONT VIEW.

crease in length from the first to the seventh, and then again diminish. The spaces between the ribs are termed the *intercostal spaces*. On examining a rib taken from about the middle of the series, we find that it presents two extremities (a posterior or vertebral, and an anterior or sternal), and an intervening portion, termed the body or shaft. The posterior extremity presents a head, a neck, and a tuberosity. The head is marked by two concave articular surfaces divided by a ridge, the lower facet being the larger. These surfaces fit into the cavity formed by the junction of two contiguous dorsal vertebrae, and the ridge serves for the attachment of a ligament. The neck is a flattened portion proceeding from the head; it is about an inch long, and terminates at an eminence termed the tuberosity or tubercle, whence the shaft commences. On the lower surface of this tubercle is a small oval surface, which articulates with a corresponding surface on the upper part of the transverse process of the lower of the two contiguous vertebrae. The shaft presents an external convex and an internal concave surface. A little in front of the tubercle the rib is bent inward, and at the same time up-

ward, the point where this bending takes place being called the angle. The upper border of the rib is thick and rounded, while the lower border is marked by a deep groove, which lodges the intercostal vessels and nerve.

The ribs of mammals are mostly connected, as in man, with the bodies of two vertebrae, and with the transverse processes of the posterior one. In the Monotremata, however, they articulate with the vertebral bodies only; while in the Cetacea the posterior ribs hang down from the transverse processes alone. Their number, on each side, corresponds with that of the dorsal vertebrae. The greatest number, 23, occurs in the two-toed sloth, while in the Chiroptera 11 is the ordinary number. In birds each rib articulates by means of a small head with the body of a single vertebra near its anterior border, and with the corresponding transverse process by means of the tubercle. Moreover, each rib possesses a

FIG. 2. ARTICULATION OF THE RIBS WITH THE SPINAL COLUMN, FRONT VIEW.

'diverging appendage,' which projects backward over the next rib, so as to increase the consolidation of the thoracic framework, necessary for flying. The dorsal vertebrae here never exceed 11, and are commonly 7 or 8 in number, and the ribs proceeding from them are connected with the sternum, not by cartilage, as in mammals, but by true osseous sternal ribs, which are regularly articulated at one end with the sternum, and at the other with the termination of the spinal ribs. In the chelonian reptiles the ribs (as well as the vertebrae and the sternum) deviate remarkably from the normal type, the lateral parts of the carapace consisting mainly of ankylosed ribs united by dermal plates. In the crocodiles there are only twelve pairs of true or dorsal ribs; while in the other saurians, and in the ophidians, the ribs are usually very numerous. In the frogs there are no true ribs, the reason probably being that any bony element in their thoracic walls would interfere with the enormous thoracic-abdominal enlargement which these animals periodically undergo at the breeding period. See SKELETON; SPINAL COLUMN.

RIB. In architecture, a projecting band or molding on an arched or flat ceiling. It is of universal use in all styles of Gothic architecture and it is the key-note of the Gothic system of construction. (See *GOthic ARCHITECTURE*.) Ribs were first used in certain Romanesque schools during the eleventh and early twelfth centuries, especially those of Lombardy, Normandy, and the Rhine. They simply followed the diagonal lines

of intersection of two barrel vaults on a square plan. But the Gothic system, by using the pointed arch in the ribbing, by making a complete framework of diagonal, transverse, and longitudinal ribs, not only self-sustaining, but capable of sustaining weight and transmitting thrust, and by turning the shell of each vaulting compartment into a concave surface, made of the combination the basic unit of the structure. The ribs were at first heavy and simply molded, becoming in the thirteenth century more slender and elaborately molded. Their intersection at the crown of the vault was commonly decorated with curved ornamentation in the form of floral bosses or pendants. In late Gothic, especially in England and Germany, intermediate ribs of no constructive use were added in the vaulted fields for decorative effect, some of which were called *lierne*. The fan-tracery vaults and panted vaults are two of the most elaborate of these styles of ribbing. Cusping and tracery were used in late Gothic ribbing, and the ribs often wandered in curved lines across the vaulting.

RIB, FRACTURE OF THE. A very common surgical accident, resulting usually from blows or falls upon the chest. It is not uncommon, however, for ribs to be broken by indirect violence, such as a crushing or squeezing force which springs the convexity of the ribs outward until fracture occurs. Instances are on record where the ribs of very old persons have been actually broken by very violent coughing.

The treatment for fractured ribs consists in the application of broad strips of adhesive plaster which encircle the chest wholly or in part and which by their pressure steady the broken fragments and prevent their moving upon one another in the act of respiration.

Where the sharp extremity of a broken rib penetrates the layers of the pleura and enters the lung and escape of air occurs from the lung substance into the pleura, and thence through the wound in the parietal layer of the pleura into the subcutaneous connective tissue, it is made evident by a puffiness of the skin and a peculiar crackling sensation to the touch. This condition, which is known as *surgical emphysema*, may extend over the entire trunk and occasionally has been known to invade nearly the entire body.

RIBAULT, rĕbô', or RIBAUT, JEAN (c.1520-65). A French navigator and colonizer, born at Dieppe. In 1562 he was given command of an expedition organized by the Huguenot leader, Admiral Coligny, which had for its object the founding of a Huguenot colony in America. With his two vessels he explored the Florida coast, and finally, anchoring at Port Royal, built Fort Charles, near the present Beaufort, S. C. Leaving twenty-six colonists, he went back to France, from which, on account of the civil wars, he was unable to return for some time. Meanwhile the colony had been abandoned. Another settlement of French Protestants, however, had been made in 1564 under Laudonnière at Fort Caroline, on the Saint John's River, and in August of the next year Ribaut came over with seven vessels and assumed command of the colony. The appearance of a Spanish squadron, which had been dispatched with orders to kill all the Protestants in the settlement, drove him to sea. He planned to attack the Spaniards in their new settlement at Saint Augustine, but his fleet was wrecked and

the project was abandoned after a slight initial success. Meanwhile, the Spanish leader Menéndez, and taken Fort Caroline, on the Saint John's River, by rapid and skillful tactics. Over one hundred of the garrison were murdered by the Spaniards, as well as others of the French forces who later fell into the hands of Menéndez. Ribaut, traveling toward the settlement was met by Menéndez, and with most of his party surrendered unconditionally. All but a few were put to death, Ribaut himself meeting his fate bravely. Consult: Winsor, *Narrative and Critical History of America*, vol. ii. (Boston, 1886); Parkman, *Pioneers of France in the New World* (ib., 1885); Gallard, *La Floride française* (Paris, 1875).

RIBBECK, Otto (1827-98). A German classical philologist. He was born in Erfurt, studied in Berlin under Lachmann, Böckh, and Bopp (1845), and in Bonn under Welcker, the 'last Hellenic,' and with Ritschl, whose critical method he so closely followed. After receiving his degree in Berlin he went to Italy, where he spent a year. In 1853 he became a member of Böckh's seminar at Berlin, and from 1854 to 1877 taught successively at Elberfeld, Bern, Basel, Kiel, and Heidelberg. He became Ritschl's successor at Leipzig in 1877. Ribbeck's peculiar province was Latin poetry, and his great fame was as a bold textual critic. Besides many contributions to the *Rheinisches Museum*, of which he became an editor in 1876, his more typical works are the valuable collection of Latin comic and tragic fragments (1852-55; enlarged 1871-73; 3d ed. 1897-98); the text of Juvenal (1859), which is very radically reconstructed on the general principles of his essay, *Der echte und unechte Juvenal* (1865), in which Ribbeck held satires I-9 and 11 as original and all else of the *textus receptus* late additions; the great text of Vergil (1859-62; prolegomena 1866), based on a minute study of the interrelations and history of the manuscripts, but marred by a subjective and fanciful, if brilliant, criticism, which is also to be found in the Horace of 1869; and an edition of Plautus's *Miles Gloriosus* (1881). But his most valuable works were the *Geschichte der römischen Dichtung* (1889-92; 2d ed. 1897-1900) and the masterly *Life of Ritschl* (1879-81). Mention should also be made of his series of classical character sketches, *Abrax* (1882), *Kolar* (1883), and *Agroklos* (1885), patterned somewhat on Theophrastus.

RIBBED VAULTING. A form of arched vaulting in which the masonry of the vault is sustained by ribs, which form a sort of skeleton, upon which the concave surfaces forming the shell of the vault rest. The ribbed vault is a development of the quadripartite groined vault, in which the groins are strengthened by means of ribs of masonry, but differs from it in that the concave surfaces of the vault are independent structures, transmitting the thrust to the ribs. (See GROINED VAULTING.) For the different varieties of Ribbed Vaulting, see VAULT. It is the basal unit of Gothic architecture, under which title its development is fully discussed.

RIBBON. See STRIP.

RIBBON (OF. *riban*, *ruban*, *rubant*, Fr. *ruban*; perhaps connected with Ir. *ribin*, ribbon, Welsh *ribin*, streak, Gael. *rib*, hair, rag). In heraldry (q.v.), a diminutive of the ordinary called the bend.

RIBBON-FISH. (1) Any of a variety of pelagic fishes characterized by a much elongated and compressed body, especially those of the sub-order Tainiostomi, including three families, represented by very few species. They are of very delicate structure, with naked and silvery skin, a long dorsal fin often uniting with the tail-fin, a small mouth, and a protractile snout. They are widely distributed from polar to tropical seas, but are nowhere found in abundance, being deep-sea fishes, and mere occasional visitants of the coasts. Owing to the delicacy of their frame, perfect specimens are seldom obtained. Specimens 20 feet long with a depth of 12 inches and a thickness of only an inch or two have been taken. See CARPISIL.

(2) One of the rocodors (q.v.) of the Gulf of Mexico and West Indies, *Eques lanceolatus*. Its

GULF RIBBON-FISH (*Eques lanceolatus*).

generic name is due to the long dorsal spines, suggesting a rider; and its common name to blackish-brown bands which curiously ornament its yellowish-gray body.

RIBBON GRASS. See CANARY GRASS.

RIBBONISM. The name given to a movement which originated in Ireland about 1808, and took the form of secret associations of Catholics banded together for the purpose of combating the activity of the Orangemen (q.v.), and known as Ribbon societies. The name was derived from the green ribbon which was the badge of the organization. The societies appeared chiefly in Armagh, Down, Antrim, Tyrone, and Fermanagh, and seem never to have gained a footing in the purely Catholic counties. The members of the Ribbon societies belonged almost exclusively to the poorest classes, and the religious purposes of the organization soon became merged with social and agrarian. The Catholic clergy seem consistently to have opposed the movement.

RIBBON SNAKE. One of the American garter-snakes (*Eutania saurita*) common from Massachusetts to Louisiana, but rare west of the Alleghanies. It is a light chocolate brown above, with three yellow stripes and greenish below. The only peculiarity in its habits is its fondness for water. Two closely similar species are *Eutania Suckanii* of Florida, which is clear olive with straw-colored stripes; and *Eutania proxima*, of the Mississippi Valley and Texas, which is blackish brown, with dull yellow stripes. See GARTER-SNAKE.

RIBEIRO, rî-bã'ro, BERNARDIM (c.1486-c.1550). A Portuguese poet, born at Torrão, in the Province of Alentejo. There is little positive information about this poet. He was a gentleman of the chamber at the Portuguese Court for several years, and there had an unfortunate love affair with a relative of the King, who is said by some to have been Donna Joana de Vilhena. His best known work is the pastoral

romance *Menina e Moço* (1554), the correct title of which is *Saudades* or *Tristezas*. It introduces his own love affair and a number of the personages of the Portuguese Court. Although very obscure and confused as to plot, it contains passages of descriptive beauty. The *Obras de Bernardino Ribeiro* were published in 1645, 1785, and 1852. The best modern edition is that of Dom Jose Possanha, the *Menina e Moço* with a *Prefacio* (1891).

RIBEIRO-FERREIRA, RĪ-rā'ê-rā, THOMAZ ANTONIO (1831-1901). A Portuguese poet and statesman, born at Parada de Gonta, and educated for the bar at Coimbra. In 1870 he became secretary general of the Portuguese colonies. He received the Colonial portfolio in 1878, that of the Interior in 1881, in 1885 and in 1890 was Minister of Public Works, and in 1895 and 1896 served as Minister for Brazil. In prose he wrote for the press and published two volumes of travels, but he was best known as a poet, with a typically Portuguese languor and grace, but much patriotism withal, as in *Dissonancias* (1891). Earlier poems are: *Sons que passam* (1854) and *1 esperas* (1858), both lyric collections; *Dom Jaime* (1861; 6th ed. 1880), a national epic; and *Delfina do mal* (1868; revised 1881), a narrative.

RIBERA, rĪ-bĕ'rā, JUSEPE DE, called LO SPAGNOLETTO (1588-1656). An historical painter and etcher, Spanish by birth and training, but one of the leading masters of the Neapolitan school and the greatest colorist of Italy in the seventeenth century. He was born at Jativa, Province of Valencia, January 12, 1588. First instructed by Ribalta at Valencia, he received most of his training and spent the greater part of his life in Italy. He studied after the works of the great masters in Rome, then especially after Correggio and the Venetians, from whom he derived his vivacity of color. He formed his style, however, chiefly after Caravaggio, of whom he seems to have been an independent follower, rather than a direct pupil. After years of vicissitude, he settled at Naples, where he secured a patron in the rich picture dealer Cortese, whose daughter he married. Like Caravaggio's pictures Ribera's exhibit a wild, extravagant fancy, but great vigor, and, although imbued with the darkness of shadow masses peculiar to the Neapolitan "Tenebrosi" (Darklings), they show a much finer instinct of the chiaroscuro. He delights in scenes of horror, such as tortures and martyrdoms of all kinds, but occasionally shows also poetic charm and was the first to combine realism with the Roman Catholic spirit. He painted numerous heads and half-figures of hermits, saints, and philosophers with great anatomical exactness. Especially good are his various representations of the "Martyrdom of Saint Bartholomew," examples of which are in the museums of Madrid, Berlin, and Dresden. Among his finest paintings are the "Immaculate Conception" (1635), in the Convent of the Augustine Recollets at Salamanca, excelling in splendor of color and light and in the charm of the Virgin's figure the representations of this subject by Murillo, Guido Reni, and Rubens; the "Descent from the Cross" (1637), admirable for its delineation of pain, and "Communion of the Apostles," both in San Martino, Naples; the "Adoration of

the Shepherds" (1650), in the Louvre; the "Martyrdom of Saint Lawrence," in the Vatican; a "Pieta" in the National Gallery, London; and "Saint Mary of Egypt Praying at Her Grave" (1644), in the Dresden Museum, of exceptional charm in the expression of the head. Of the fifty pictures in the Madrid Museum, the best are: "Jacob's Dream;" "The Immaculate Conception;" "Isaac Blessing Jacob;" "Magdalen;" "Saint Rochus;" "Prometheus;" and "The Blind Sculptor of Gamba, etc." Of singular interest is a half figure of "Homer, as Improviser with the Violin," in the Turin Gallery, and his latest work, the "Saint Sebastian" (1651), in the Museum of Naples. Of his twenty-six etchings the best known are "The Drunken Silems with Satyrs" (1628), the equestrian portrait of "Don Juan d'Anstria" (1648), two of "Saint Jerome," and "Satyr Scourged by Cupid." Consult: Bermudez, *Diccionario historico . . . de las bellas artes*, iv. (Madrid, 1800); Eisenmann, in Dohme, *Kunst und Künstler Italien*, iii. (Leipzig, 1879); Woermann, in *Zeitschrift für bildende Kunst* (ib., 1890); and *Diccionario enciclopedia hispano-americano*, xvii. (Barcelona, 1895).

RIBHUS (Skt. *ṛbhū*, dexterous, from *rabh*, Gk. *ῥαβδαν*, *lambancia*, to take; ultimately connected with Ger. *Alp*, AS. *alp*, Eng. *alp*). In Vedic mythology, a group of divine artificers. They are usually three in number, and were originally mortals. They are closely associated with Indra, and also with Savitar, the sun, while in their appearance they are like the sun, and ride in a bright car drawn by fat steeds. They are most frequently mentioned as the artisans of the gods. The physical basis of the divine aspect of the Ribhus is doubtful. Some scholars regard them as the three seasons which are at a standstill during the twelve days of the winter solstice. Consult: Nève, *Essai sur le mythe des Ribhavas* (Paris, 1847); Maedonell, *Vedic Mythology* (Strassburg, 1897); Ryder, *The Ribhus in Rigveda* (Göttersloh, 1901).

RIBOT, rĪ'bō', AUGUSTIN THÉODORE (1823-91). A French genre and portrait painter of the realistic school, born at Saint-Nicolas d'Azé (Eure). He first painted mirror frames, and then worked for a while under Glaize and studied Chardin and the Dutch and Spanish masters in the Louvre. He began his exhibits at the Salon by a series of still-life pictures and kitchen scenes, painted broadly with strong Rembrandt-like effects of light and shade. These include "Cooks at Dinner Time" (1861), and "Chickens Roasting" (1861). His "Saint Sebastian" (1861) showed his powerful, if somewhat coarse, talent, in another manner. This picture, with "The Good Samaritan," and "Jesus in the Temple," is in the Luxembourg. His later works were mainly portrait heads, chiefly of old people, which are wonderful studies of wrinkled flesh and startling expression. He was decorated with the Legion of Honor. Consult Muther, *The History of Modern Painting* (New York, 1896).

RIBOT, ALEXANDRE ÉLIX JOSEPH (1812-71). A French statesman, born in Saint Omer (Pas de Calais), and educated for the law in Paris. He was one of the founders of the Société de Législation Comparée, was for two years (1875-77) at the head of a department in the Ministry of Justice, and in 1878 was elected a Deputy.

He became a member of the Left Centre, defended Dufaure's policy, and in his general conservatism was especially prominent as opposed to the colonial policy of the Ferry Cabinet. In 1890 he became foreign Minister in Freycinet's Cabinet, a portfolio which he also held under Loubet. From December 1892 to March 1893, he was president of the Cabinet, and on Faure's election, in 1895, was again called to form a Cabinet, which did not last the year out. After Fashoda, Ribot again urged his conservative colonial policy of prudent waiting. In the Dreyfus affair, although he had previously urged all possible publicity, he successfully opposed the prosecution of Mercier. Ribot made a special study of English politics, and in 1866 wrote a *Biographie de Lord Erskine*.

RIBOT, THÉOPHILE ARMAND (1839—). A French psychologist. He was born at Guingamp, December 18, 1839, and was educated at the Lycée de Saint-Brieuc and at the Ecole Normale, Paris, where he graduated in 1862, and whence he received a doctor's degree in 1875. After teaching for several years as professor of philosophy at various lycées, he came to Paris and turned to the investigation of experimental and physiological psychology in the histological and physiological laboratories and at the clinics of the insane asylums. In 1876 he founded the *Revue philosophique*, of which he became the editor. In 1885 he was given charge of a course in experimental psychology at the Sorbonne, and in 1888 was called to the chair of experimental and comparative psychology in the College of France. Ribot has taken a leading part in the recent development of psychology in France, adopting the best methods of both the German and the English psychologists, while at the same time his work has been characteristically French in breadth of view. Especially valuable have been his psychopathological studies and the analytical and comparative treatment of distinctive types or fields of mental phenomena in his later books. Best known are *La psychologie anglaise contemporaine* (1870; trans., London, 1873); *L'hérédité psychologique* (1873, 5th ed. 1889; trans., London, 1875); *Philosophie de Schopenhauer* (1874; 7th ed. 1896); *Psychologie allemande contemporaine* (1879, 13th ed. 1898; trans., New York, 1886); *Les maladies de la mémoire* (1881, 13th ed. 1898; trans., International Scientific Series, xli., New York, 1882); *Les maladies de la volonté* (1883, 14th ed. 1899; trans., New York, 1884); *Les maladies de la personnalité* (1885, 8th ed. 1899; trans., Chicago, 1895); *La psychologie de l'attention* (1889, 3d ed. 1897; trans., Chicago, 1896); *Psychologie des sentiments* (1896, 3d ed. 1899; trans., London, 1897); *L'évolution des idées générales* (1897; trans., Chicago, 1899); *Essai sur l'imagination créatrice* (1900).

RICARDO, rē-kār'dō, DAVID (1772-1823). An eminent English political economist, born in London. His father, a Jew from Holland, gave him an education in a commercial school in that country. When fourteen years of age Ricardo left school to engage in his father's business on the stock exchange, for which he showed remarkable aptitude. At nineteen he entered the Church of England and was renounced by his father. Thrown upon the world without resources, he set up as a broker, with such success that he was reckoned a man of

wealth by the time he was twenty-five years of age. It was about this time that he was attracted to the works of Adam Smith, and he began to devote himself to economic studies, though he did not wholly withdraw from business life until 1818. His first publication on economic studies was a pamphlet issued in 1809, and entitled *The High Price of Bullion a Proof of the Depreciation of Bank Notes*. This work created considerable stir, and received, as it were, official confirmation in the famous Report of the Bullion Committee in 1811, in the drafting of which Ricardo is reported to have had great influence. A series of pamphlets on financial subjects followed this first venture, and in 1817 appeared his *Principles of Political Economy and Taxation*, on which his fame chiefly rests. In 1819 he entered the House of Commons, and while his diffidence prevented him from becoming a notable speaker, he maintained there a high authority upon all matters pertaining to finance and taxation until his death.

Ricardo exercised a greater influence upon economic thought than any other of the earlier writers except Adam Smith. His writings cover the fields of abstract theory, currency, taxation, and protection, in each of which he contributed much that was of permanent value. In economic theory his name is associated with the law of rent (q.v.), which he did not originate, but expounded so forcibly that it became generally known through his works; the so-called "iron law of wages," that wages in the long run cannot exceed the minimum of subsistence, for which he is, however, no more responsible than Adam Smith; the labor theory of value, according to which commodities tend to exchange in proportion to the quantity of labor that has been expended upon them. None of these theories receives unqualified acceptance at the present day, although existing theories have been profoundly influenced by them. His writings on taxation are abstract, and throw considerable light upon the problems of incidence of taxes. The most complete part of his work is his discussion of currency. His is the first adequate and clear statement of the quantity theory of money. (See MONEY.) The doctrine of comparative costs (see INTERNATIONAL TRADE) is one of his most important discoveries in the realm of international trade.

In addition to the works mentioned in the text, he was author of a large number of pamphlets on taxation, currency, and protection, and of numerous controversial letters to Malthus, J. B. Say, McCulloch, and other economists.

RICASOLI, rē-kā'zō-lē, BETTINO, BARON (1809-80). An Italian statesman, born at Florence. He was a descendant of an ancient Lombard family, studied at Pisa and Florence, and passed the early years of his life on his estate devoted to the study of agriculture, on which subject he wrote a number of useful works. In 1847 he appeared in politics as a leader of the Moderate Liberals and an advocate of Italian unity, and was elected Mayor of Florence. In 1849 as a member of the executive commission he was instrumental in recalling the Grand Duke Leopold, trusting to the constitutional promises given by the latter. Leopold returned accompanied by the Austrians, and Ricasoli, indignant at this treachery, retired into private life.

In 1859 he assumed the leadership of the liberal movement in Tuscany, and after the flight of the Grand Duke was made dictator (August 15). In this office he exerted himself for the union of Tuscany with Sardinia. His firmness strengthened the hands of Cavour and Victor Emmanuel, and on the 20th of March, 1860, he was able to announce to the Tuscan assembly that its work was done. In the same month he was made Governor-General of Tuscany. On the death of Cavour (June, 1861) Ricasoli was called to the head of the Ministry. His Cabinet, however, could not withstand the Radical assault, and he resigned in March, 1862. He returned to power in June, 1866, and retired in April of the following year, when he was succeeded by Ratazzi. Consult his *Lettere e documenti* (10 vols., Florence, 1888-95); Ongaro, *Bettino Ricasoli* (Turin, 1861); Passerini, *Genealogia e storia della Famiglia Ricasoli* (Florence, 1861).

RICCI, rit'chè, FEDERIGO (1809-77). An Italian dramatic composer, born in Naples. He was educated in music at the Conservatory of San Sebastiano, after which he followed his older brother to Rome. His first great success was won by the opera *La prigioniera d'Edimburgo* (1837), which was followed by the scarcely less successful *Un duello sotto Richelieu* (1839); *Michelangelo e Rolla* (1841); and *Corrado d'Altamura*. In 1853 he went to Saint Petersburg as inspector of the vocal classes in the Theatre School, and about 1870 left that city to superintend personally his own musical productions in Paris. One or two of his operas had been translated and adapted for the French stage, and their success led him to bid for French favor with the more ambitious operas *Docteur Rose* (1872), and *Chi dura vince*. He was disappointed, however, and in 1876 returned to Italy. Additional compositions included masses, cantatas, songs, as well as several other operas. He died at Conegliano.

RICCI, LUIGI (1805-59). An Italian dramatic composer. He was born in Naples, and, like his brother Federigo, was educated at the Conservatory of San Sebastiano, Naples. He composed several very successful operas which he presented in rapid succession, and in 1836 became maestro di capella at the Cathedral of Trieste, and vocal director of the city theatre. After this much of his work was done in collaboration with his brother until 1859, when he was stricken with disease of the brain, and after confinement in the Prague asylum died there. He wrote about 30 operas, of which perhaps *La festa di Piedigrotta* (1852) and *Il diavolo a quattro* (1859), written jointly with his brother, are among the best. His masterpiece, however, was *Crispino e la Comare* (1850), one of the best comic operas of Italy and the only one still performed outside of it. Other compositions include masses, sacred and secular songs, and duets.

RICCI, MATTEO (1553-1610). The founder of the Jesuit missions in China, and a celebrated astronomer, born at Macerata, Italy. After studying law at Rome he entered the Society of Jesus in 1571. In 1577, while still a scholastic, he went on the mission to India. There he was ordained, and because of his ability in Eastern languages, especially in Chinese, selected to found the mission in China. Ricci published

several books in Chinese which attracted the attention of Chinese literati by the purity of their style. He resolved to make his way to Peking, and in 1601, as a Chinese scholar succeeded in reaching Nanking, 1605, but was not allowed to remain, and later he wrote a series of didactic works in Chinese on a *Declaratio Jesuicæ*. In imitation of Chinese he composed the Chinese manuals that he obtained the permission to go to Peking. He presented to the Emperor a telescope and various astronomical instruments, which were still in the palace when the Allies forced an entrance in 1600. After this he was allowed to reside at Nanking. In 1601 he obtained permission to build a church and found a mission in Peking itself. Ricci long his mathematical teaching and classical Chinese style obtained for him great prestige. He became a special favorite of the Emperor, and through his influence Christianity was introduced into the principal cities of China. There is an important work by him which contains a number of valuable observations on the geography and history of China. His book *On The Nature of God*, written in Chinese, has been admitted into the number of Chinese classics. Consult biographies by Sainte-Foi (Paris, 1859) and Werter, 2d ed., Regensburg, 1870.

RICCI, SCIPIO DE (1741-1810). An Italian bishop, born at Florence. He was ordained a priest in 1766. For some time he was auditor to the Papal Nuncio at Florence, and in 1780 was appointed Bishop of Pistoja and Prato. He attempted to introduce certain reforms in the Church, but though he was supported by the Grand Duke Leopold, brother of Emperor Joseph II., and his reform measures were approved by the diocesan synod of Pistoja in 1786, he was opposed at the general Tuscan Synod, held at Florence in 1787. When Leopold left Tuscany, Ricci was forced by the anger of the populace to flee from Pistoja (April, 1790), and he formally renounced his episcopal dignity in June, 1791. Consult his *Life* by Potter (Brussels, 1825), and his autobiography, *Memorie* (Florence, 1865).

RICCI, SEBASTIANO (1659-1734). An Italian painter of the Venetian school, born at Cividale di Belluno. He was a pupil in Venice of Corbelli, with whom he painted in Milan, Bologna, and Venice. Afterwards he visited Austria and England, where he remained ten years. His works in England include the decorations of the chapel at Bulstrode for the Duke of Portland, of the hall at Burlington House, and those in the chapel of Chelsea Hospital. "The Continence of Scipio," and "The Dinner at Simon's House," two of his best productions, are at Hampton Court. He executed a large number of works distinguished for vivacity of conception, grace of form, and fine color.

RICCIARDELLI, rit'chè del'le, DANIELE. See VOITEARA, DANIELE DA.

RICCIO, DAVID. See RIZZO.

RICCIO, rit'chè, DOMENICO, called BRUSASORCI (1494-1567). An Italian painter of the Venetian school, born in Verona. He was the pupil of Caroto, but was strongly influenced by Giorgione and Titian. Most of his works, chiefly frescoes, are to be found in his native city. Those which depict mythological subjects are better than his purely religious pieces. He painted the facade of the Casa Murari, now ad-

most d'Aroya I. and "The Entry of Clement VII. and Charles V. into Bologna," in the Palazzo Rucellai. This last, his most celebrated work, is notable for the dramatic expression of the figures and its fine color. Domenico's son FELICE (1510-1605), also called BRESASARCI, studied under Ligozzi in Florence. A number of his religious paintings are in the Verona churches, and there is a "Holy Family" by him, in the Louvre. His style is refined, and his coloring rich and pleasing.

RICCOBONI, rik'kô-bô'nô, LODOVICO, called LILLO (1677-1753). An Italian dramaturgist, born at Modena. In 1699 he became director of a company of players, by whose aid he did away with the traditional Italian comedy of masks, and presented the *Pastor fido* and other dramas of importance. Opposition to him at Venice and in the Lombard towns caused him to withdraw to Paris, where from 1716 to 1729 he conducted an Italian theatre in the Hôtel de Bourgogne. He returned thence after a brief residence at Parma (1729-31). His publications include the *Histoire du théâtre italien* (1728-31).

RICCOBONI, MARIE JEANNE LABORAS DE MÉZIÈRES (1714-92). A French novelist, daughter-in-law of the preceding. She was born in Paris. She wrote the once popular novels of society, *Histoire du marquis de Crécy*; *Lettres de milady Catesby*; *Ernestine*, etc., but she is best known as the continuator of *Marianne*, by Marivaux (q.v.).

RICE (OF. *ris*, Fr. *riz*; from ML. *oryzum*, Lat. *oryza*, from Gk. *ὄρυζα*, *oryza*, *ὄρυζον*, *oryzōn*, rice; connected with Afghan *rrizi*, Skt. *rrihī*, rice). A genus of grasses of which the only important species is the common rice (*Oryza sativa*), one of the most useful and extensively cultivated grains, supplying the principal food of one-half of the human race. It seems to have been originally a native of the East Indies, but has spread to all quarters of the globe, wherever the conditions of warmth and moisture are suitable. It is adapted to subtropical climates, rather than tropical or cold temperatures. Rice is an annual, varying from two to five feet in height. The seed or grain grows on little separate stalks, springing from the main stalk; and the whole appearance of the plant, when the grain is ripe, may be said to be intermediate between that of barley and oats. Rice requires a moist soil, artificially flooded at certain seasons. There are, however, varieties called upland rice that do not require flooding. The cultivation is most extensively carried on in India, China, and other southeastern parts of Asia, Japan, Egypt, the southern countries of Europe, South Carolina, Georgia, and the Gulf States of North America. The best of all rice known in the market is that of Carolina, yet the introduction of rice into that country occurred only about the end of the seventeenth or the first part of the eighteenth century. Rice is known in India as Paddy—a term also used to designate rice in the husk. See PLATE of CEREALS.

In China, where, as in other warm countries, two crops may be obtained in a year, rice is generally sown thickly on very wet land, and afterwards transplanted to the land which it is finally to occupy. The plants tiller or spread at the root very much, so that each sowing up several or many stalks. The rice-grounds are

carefully weeded, although often so wet that the workmen may sink to their knees.

The origin of the regular production of rice in America is referred to the latter part of the seventeenth century, when a vessel from Madagascar is said to have brought a sack of the grain to Charleston, S. C. This yielded well, the culture spread, and eventually rice became the staple product of that State, until the War of the Rebellion checked it. The mode of cultivation best adapted to the plant in South Carolina has been found to be by irrigation, and it is chiefly grown where the land was formerly overflowed by the tides. The cultivation of rice spread rapidly to most of the Southern States, but of late years Louisiana and Texas have been the most successful in its cultivation. The prairies of the southern parts of the States have proved to be well suited to the cultivation of rice. The land is irrigated by pumping water from rivers and wells and so regulated as to permit of the use of machinery as in growing other small grains. The ground is plowed, harrowed, and rolled, and the seed planted with drills. The ground is allowed to dry sufficiently at harvest time to enable the use of binders and the grain is afterwards threshed with steam threshers. It is also grown on lowlands subject to overflow from the river, with due precautions against a possible crevasse. The water is conveyed by ditches and laterals, and is alternately turned on and drained off, as the condition of the plants' progress may demand. When mature the water is drained off, the grain cut and left to dry. After threshing, it is winnowed and placed in sacks, ready for the mill or market. The 'upland' rice is dry-cultivated, and is claimed by some planters to be better than the lowland. It is grown upon high and dry land, and, after the manner of other grain, the yield is not so generous as on the lowland. The milling of rice consists in removing the outer husk or coat. From the thresher the rice is sent to the mills in barrels holding 162 pounds each. From this quantity of rough rice, the mills secure 95 pounds of clean rice, 8 pounds of polish, 30 pounds of bran, and 29 pounds of waste. The rice polish and rice bran are mixed and sold as a feeding stuff under the name of rice feed or rice meal. It is very nutritious and is largely employed as a food for pigs.

The production of rice in the United States in 1899, as given in the Twelfth Census, was as follows:

	Pounds
Georgia.....	11,174,562
Louisiana.....	172,732,430
North Carolina.....	7,892,580
South Carolina.....	47,360,128
Texas.....	7,186,863

The amount did not supply the home market, and in addition 204,177,000 pounds were imported. The world's production of rice in 1899 was:

	Pounds
North America.....	283,722,627
Europe.....	1,507,368,000
Asia.....	72,386,748,000

Canada rice (*Zizania aquatica*), the wild rice of North America, is a species of a different genus of grass quite different from the true rice. It is particularly abundant in the Northwest, growing in miry places or shallow water, often in the margins of lakes. The seeds are about

half an inch long, slender, farinaceous, affording very good meal, and used to some extent by the Indians where the plant abounds. Owing to its tendency to scatter its seed, its production has not reached any economic importance.

WILD RICE (*Zizania aquatica*).

Aside from its use as food (see below), rice is subjected to fermentation in many countries. The beer made from it (sake) is in general use among the Japanese. Several kinds of highly esteemed and very intoxicating wines are made from rice by the Chinese. A spirit is distilled from the lees. Rice starch is made in considerable quantity and is used in laundries and muslin factories. Rice straw is used to make bonnets and also to some extent as a feed for cattle.

FEEDING VALUE. The rice grain is not directly used as a food for farm animals. However, its by-products, chaff-meal, bran, and polish, are fed especially in regions where rice is grown. The straw also has a feeding value.

Rice bran and rice meal contain more or less of the germ, and are fed to dairy cows and pigs. According to recent experiments rice meal has practically the same value for pigs as corn meal when fed in addition to skim milk. Rice polish is a fine powder of high nutritive value and is very valuable for cows, pigs, etc. As it is rich in both nitrogen and potash, it produces a valuable manure. Rice hulls are too woody to be of much

food value. They are largely used for packing around breakable articles. Unlike most cereal grains, rice is seldom made into bread or cakes, but is eaten boiled. In China, Japan, and other countries where the majority of the people cannot obtain animal food, rice, which is rather deficient in protein (see table), is supplemented by special products made from the soy bean (q.v.), which are rich in protein. In Europe and America rice is used as a vegetable and for making soups, puddings, cakes, etc.

Rice flour has the following percentage composition: Water, 8.6; protein, 8.6; fat, 6.4; nitrogen free extract, 51.9; crude fibre, 16.1; and ash, 8.8. Flaked rice, a breakfast food, has the following average percentage composition: Water, 9.5; protein, 7.7; fat, 9.4; nitrogen free extract, 81.7; crude fibre, 0.2; and ash, 0.3. Rice is believed to be very thoroughly digested. Judged both by palatability and wholesomeness, it is worthy of the high esteem in which it is held.

RICE, ALLEN THORNDIKE (1853-89). An American editor, born in Boston, Mass. He graduated at Oxford University in 1875, and in 1876 bought the *North American Review*, of which he subsequently became the editor. In 1879 he promoted the Charnay expedition, which, under the patronage of France and the United States, was sent to investigate the remains of primitive civilization in Central America and Mexico. He was the first to recommend the introduction into the United States of the Australian ballot system. He edited *Reminiscences of Abraham Lincoln* (1886) and was a contributor to *Ancient Cities of the New World* (1887).

RICE, DANIEL (1822-1900). An American circus-performer, born in New York City. Originally his name was McLaren. He became an acrobat, travelled as a circus-clown, and, after winning wide popularity, established a show of his own. He was also very successful financially and devoted considerable sums to charitable and public purposes. During the Civil War he promoted recruiting and subsequently delivered occasional lectures in favor of temperance. As a clown probably no other man, except perhaps George L. Fox, won such lasting recognition as did Rice.

RICE, JAMES (1843-82). An English novelist, born at Northampton, September 26, 1843. He studied at Queen's College, Cambridge, and was called to the bar at Lincoln's Inn (1871). Never taking very seriously to his profession, he gave most of his time to literature. As editor and proprietor of *Once a Week*, from 1868 to 1872, he made the acquaintance of Walter Besant, with whom he collaborated on several remarkable novels, as *Ready Money Mortibon* (1872), which was successfully dramatized (1874); *The Golden Butterfly* (1876); *The Monks of Acheana* (1877); and *The Scamby Side* (1884). Besides these and other novels, they wrote in conjunction several Christmas stories for *All the Year Round* and *The World*. There had been no literary partnership so successful as this since that of Erckmann-Chatrian. Of the Besant-Rice collaborations perhaps *The Golden Butterfly* and *Ready Money Mortibon* are the most vigorous. In exaggeration they show the influence of Dickens, but they are not lacking in real humor, sanity, and character drawing. Rice also wrote a gossipy *History of the British Turf* (1879).

RICE, LUTHER (1783-1836). An American clergyman, born at Northborough, Mass. He graduated at Williams College in 1810 and, after studying theology at Andover Seminary, sailed for India as a missionary in 1812. Soon after his arrival he left the Congregationalists and joined the Baptists, as his friend Adoniram Judson had done a few weeks before. He soon returned to the United States and devoted himself to organizing missionary societies and raising funds among the Baptists. Largely through his efforts Columbian University, at Washington, was founded, and for many years he was its treasurer and devoted much energy to its welfare. Rice was a preacher of unusual power and left a deep impress on the Baptist denomination.

RICE, THOMAS D. (1808-60). An American comedian, born in New York City. He was apprenticed to a wood-carver, but was attracted to the theatre, where for a time he served as a supernumerary. Soon, however, he turned to negro minstrelsy, in which he became famous in both America and Great Britain. By many he is held to be without equal in his peculiar branch of comic acting. Among his popular performances were the burlesque tragedy *Othello*, the farces *Jumbo Jim* and *The Virginia Mammy*, and *Bone Squash Diavolo*, a travesty on *Fra Diavolo*. Many of his songs, such as "Luey Long," "Jim Crow," and "Sich a Gittin' Up Stairs," held a place among the songs of the people in his day. At the height of his success Rice was noted for his eccentric extravagance, but he died in poverty.

RICE, WILLIAM NORTH (1845—). An American educator, born at Marblehead, Mass. He graduated at Wesleyan University in 1865 and received the degree of Ph.D. from Yale in 1867. From that year he was professor of geology at Wesleyan. He was an assistant to the United States Fish Commission in 1873-74, president of the American Society of Naturalists in 1891, and assistant geologist to the United States Geological Survey in 1891-92. He wrote: *Geology of Bermuda* (1884); *Science Teaching in the Schools* (1889), and *Twenty-five Years of Scientific Progress and Other Essays* (1894).

RICE-BIRD. The name in the Gulf States of the bobolink (q.v.).

RICE INSECTS. The rice weevil (*Calandra oryzae*) is a cosmopolitan insect, which probably originated in India and has been diffused by commerce until it is found in most grain-growing countries. In the Southern United States it is known as 'black weevil.' It feeds upon the grain of rice, wheat, corn, barley, rye, oats, and sorghum, and also infests such breadstuffs as crackers and cakes, and is frequently found in flour and meal. It was originally bred from rice, whence its specific name; and it is amenable to the same bisulphide-of-carbon treatment ordinarily applied for other insects injuring stored grain. The rice grub of the Southern United States is the larva of a scarabæid beetle (*Chalcopus trachypygus*), which looks like the ordinary white grub. It feeds upon the roots of upland rice, but in fields which are frequently overflowed it cannot exist. The so-called 'water weevil' (*Lissorhoptus simplex*), however, does exist in overflowed fields.

The rice-stalk borer is the larva of a crambid moth (*Chilo plejadellus*). The moth lays its eggs

in the early summer upon the rice stalks, and the young larvae bore into the stalks, working their way gradually toward the roots. It transforms to the pupa stage within the stalk, and after five or six days the moth emerges. It is of a very pale yellowish or straw color, with golden fringes to the front wings, and expands about one inch. Stalks inhabited by the borer turn white, and this insect is responsible for a certain amount of the so-called 'white blast' of rice fields. The chinch bug (q.v.) also feeds upon the rice heads, but is seldom abundant enough to do much damage; while in the periods between the overflows the 'grass-worm' (larva of *Laphygma frugiperda*), when occurring in large numbers, may ravage a field. See GRASS-WORM.

Consult *Annual Report, United States Department of Agriculture* (Washington, 1881-82).

RICH, BARNABE (1540?-1620?). An Elizabethan writer. He served in the war with France (1557-58) and thereafter, through most of his life, with the army in Ireland. During his leisure he learned French and Italian and acquired a knowledge of the classics through translations. He claimed to have written thirty-six books, of which the best known is a series of short stories entitled *Riche his Farewell to Militarie Profession* (1581; reprinted by the Shakespeare Society, London, 1846). From this collection Shakespeare drew the plot of *Twelfth Night*. Afterwards Rich issued many romances in the style of the *Euphues*, military reminiscences, and pamphlets against the Papists and tobacco. Consult Jusserand, *The Novel in the Time of Shakespeare* (London and New York, 1890).

RICH, CLAUDIUS JAMES (1787-1827). An English traveler and Orientalist. He was born at Dijon, France, of English parents. His early years were spent in Bristol, where he was educated. He showed a remarkable aptitude for Oriental languages, and through friendly influence he received a cadetship in the East India Company service in 1803, but when his linguistic attainments became officially known he was transferred to the Bombay civil service as a writer. He was ordered to proceed via Egypt as secretary to the Consul-General to that country, but the vessel in which he traveled was burned in the Gulf of Rosas, Spain. He managed to escape, and, after many adventures in Malta, Italy, Constantinople, Smyrna, and the interior of Asia Minor, everywhere familiarizing himself with the vernaculars, he spent some time in Egypt. Disguised as a Mameluke, he traveled through Palestine and Syria, and, sailing from Basra, reached Bombay in 1807, where he was welcomed by the Governor, Sir James Mackintosh. Four months later he married the Governor's daughter and was appointed Resident at Bagdad, where he remained six years. He made a valuable collection of coins, gems, manuscripts, and material for a history of the region, in 1811 visited the site of Babylon, in 1813 sought recuperation from illness at Constantinople, and in 1814 journeyed through the Balkans and visited Vienna and Paris. After his return through Asia Minor to Bagdad, he revisited Babylon, and for his health traveled through Kurdistan in 1820. He definitely established the site of ancient Nineveh (q.v.). He died of cholera at Shiraz, in Persia, while assisting the sick. His published writings include two *Memoirs on The Ruins of Babylon* (1815 and

1818), and *Narrative of a Residence in Kurdistan and on the Site of Ancient Ninurck, with Journal of a Voyage Down the Tigris to Bagdad, and an Account of a Visit to Shiraz and Persepolis* (2 vols., 1836), edited with a biographical sketch by his widow. His Oriental collection was acquired by the British Museum.

RICH, EDMUND. An Archbishop of Canterbury. See EDMUND, SAINT.

RICH, JOHN (1682?-1761). A noted English harlequin and theatrical manager. His father, Christopher Rich, had been a manager of Drury Lane, and after the death of the elder Rich, in 1714, the son opened the new theatre in Lincoln's Inn Fields. It was in 1716 that he introduced the performances in which, under the name of Lum, he himself acted the part of Harlequin (q.v.). Before many years these had developed into the regular English pantomime (q.v.) and had become immensely popular. In 1732 he opened the theatre of Covent Garden, which he continued to manage till his death. In his harlequinades Rich combined an extraordinary agility and pantomimic gift with great ingenuity in devising novelties to attract the public. Consult Doran, *Annals of the Stage* (ed. Lowe, London, 1888).

RICH, PENELOPE. Lady (c.1562-1607). The object of the poetic passion of Sir Philip Sidney's sonnets addressed to 'Stella.' She was a daughter of the first Earl of Essex, who, together with his son Robert, Elizabeth's favorite, received kindly Sidney's offer of marriage. But her guardian, the Earl of Huntingdon, married her, probably in 1581, to Robert, Second Baron Rich, apparently against her will. The sonnets *Astrophil and Stella*, published after this marriage, sneer at the husband's lack of worth and of ability to appreciate her worth—an attitude toward Lord Rich which is also taken by Richard Barnfield, Bartholomew Yonge, and others who wrote poetry to Lady Penelope. But her marital unhappiness did not stop at this stage. In 1595, at the latest, she had formed a liaison with Lord Mountjoy, to whom she bore three sons and two daughters, and with whom, after Rich's abandonment of her, which did not occur until after the execution of her brother Robert (1601), she lived openly, even before her divorce in 1605. After her husband's remarriage she married Mountjoy, then Earl of Devonshire, and thus lost her standing at Court, where she had been a great favorite.

RICHARD I. (1157-99). Surnamed CŒUR DE LION, or THE LION-HEARTED. King of England from 1189 to 1199. He was the third son of Henry II. and his Queen, Eleanor, and was born at Oxford, September 8, 1157. When a mere infant it was decided that he should inherit Aquitaine, and he was betrothed to Alice, or Alicia, the youngest daughter of Louis VII., King of France. Like his brothers, Richard on several occasions rebelled against his father, King Henry II., and was the most prominent figure in the final rebellion, which hastened the death of that monarch. Since the eldest son of Henry II. had died, in 1183, Richard succeeded to all the possessions of his father. He had taken the cross in 1187, on the news of the capture of Jerusalem by Saladin. Philip Augustus, King of France, had done likewise, and in 1190 both started on the

Third Crusade. Richard, in order to prepare suitably for this Crusade, had borrowed and expended money wherever possible. The administration of England during his absence was intrusted to William Longchamp (q.v.), but the prelate was opposed by the king's brother, John Lackland, who gradually usurped the government of the country.

The Crusade proved a failure almost from the start, chiefly on account of the lack of harmony between the two kings. After various delays Richard reached Messina on September 23, 1190. He tarried in Sicily more than half a year, and betrothed his nephew Arduin to the infant daughter of King Tancred. The Sicilian throne was at that time claimed by the Emperor Henry VI., and the alliance with Tancred, for this reason, afterwards turned out a very unlucky one for Richard. He fell out with the French King, refused to marry his sister Alice, and on April 19, 1191, sailed from Messina, carrying along with him Berengaria of Navarre, whom he married on May 12, 1191, in the Island of Cyprus, where he halted on his way to Palestine. The prodigies of personal valor which he performed in the Holy Land have made the name of Richard the Lion-Hearted famous in romance. After Acre had been captured, on July 12, 1191, Richard executed 2700 prisoners of war because the payment of their ransom was delayed. (See CRUSADE.) He quarreled bitterly with Philip Augustus, who went home. After spending months in indecisive contests against Saladin, Richard finally made a truce by which Jerusalem was left in the hands of the Sultan. On October 9, 1192, he set out on his return to England. As he was making his way through the dominions of Leopold, Duke of Austria, he was seized by that prince, who had been insulted by Richard while in the Holy Land, and was handed over to the Emperor Henry VI., who detained him as a captive.

John, meanwhile, ruled in England, and he and Philip of France had good reasons for wishing that Richard should never return to his kingdom. He was finally released, however, after paying a heavy ransom and agreeing to hold his kingdom as a fief of the Empire. On March 13, 1194, he found himself once more in England. His brother, John, who had acted so treacherously toward him, he magnanimously forgave, but with Philip Augustus he made war, while he left the actual government to the able administrator Hubert Walter (q.v.). He was on the whole victorious in his war against France, but was killed by an arrow shot from the Castle of Chaluz, which he was besieging, and died April 6, 1199. His character has generally been shown by modern historians in a very unfavorable light. Sismondi's words are often quoted: "A bad son, a bad brother, a bad husband, and a bad king." This estimate is somewhat unjust to Richard. He was extremely generous to John; there is no trustworthy evidence that he was a bad husband; as King he chose able ministers and left most of the ruling to them. But he did tax England heavily for his expeditions. He was a poet and well versed in the knightly accomplishments of his age. In the succeeding century he became the hero of many legendary tales, and he has always been viewed in popular literature as a hero of romance. Consult Stubbs, *Constitutional History of England*, vol. i. (16th

ed., Oxford, 1897); Round, *Feudal England* (London, 1895); Norgate, *Angelin Kings* (2 vols., b., 1887); Stubbs, *Early Plantagenets* (5th ed., b., 1886); Toeche, *Heinrich VI.* (Leipzig, 1867); Archer, *Crusade of Richard I.* (New York, 1889); Bloch, *Forschungen zur Politik Kaiser Heinrich VI.* (Berlin, 1892). Sir Walter Scott, in *Iranhoe* and *The Talisman*, has used some of the best-known legends.

RICHARD II. (1367-1400). King of England from 1377 to 1399. He was the second son of Edward, the Black Prince, and Joan of Kent, and was born at Bordeaux on January 6, 1367. Many miraculous stories arose in time concerning his birth, due chiefly to his subsequent unfortunate career. Richard's elder brother died in 1371, and his father in 1376, so that he was placed in the care of his uncle John of Gaunt (q.v.). On June 21, 1377, Edward III. died and left to the infant King a country devastated by plague and a people oppressed by heavy taxes due to the war with France (q.v.). Parliament, which had obtained greater power in the last years of Edward III.'s reign, sought now to secure control of the government, but was opposed by John of Gaunt and his followers. In 1381 took place the Tyler Insurrection (q.v.), which was caused by an onerous capitation tax. The speedy suppression of this dangerous rising was due to a considerable extent to Richard's spirit and daring. In 1382 Richard was married to Anne of Bohemia, and in the same year the King began to seek the downfall of the great nobles, who controlled Parliament and prevented the development of the royal power. The next two years were occupied by a war with France, with which country Scotland was allied. For a while Richard conducted the war in Scotland in person, and Edinburgh was burned. In the absence of John of Gaunt in Spain, Richard's youngest uncle, the Duke of Gloucester, put himself at the head of affairs; and an attempt which Richard made to free himself from control having been defeated, several of his counselors were put to death, which act was approved by the Parliament of 1388. In 1389, however, Richard, by a coup d'état, succeeded in throwing off the yoke. Gloucester, Warwick, and Arundel were deprived of their power. These three nobles, together with Henry, Earl of Derby, eldest son of John of Gaunt, and Thomas Mowbray, Earl of Nottingham, had been the nobles who had 'appealed' or accused Richard's adherents in 1388. Hence they are known in history as the 'lords appellants.' In 1394 Richard went to Ireland and received the submission of the four 'Kings' of Meath, Thomond, Leinster, and Connaught.

The same year the Queen died, and in 1396 a marriage treaty was concluded between Richard and Isabella, infant daughter of King Charles VI. of France. Gloucester disapproving of this marriage, which seems to have been unpopular, Richard caused him to be privately arrested, and conveyed to Calais, where he either died or was murdered. On the meeting of Parliament, the Earl of Warwick was banished, and the Earl of Arundel beheaded. A misunderstanding having taken place between Henry, Duke of Hereford (formerly Earl of Derby), and Mowbray, Duke of Norfolk (formerly Earl of Nottingham), the King, desirous to be rid of both, sent the former into confinement for ten years, and the latter for life. But Hereford had been ass-

siduously cultivating the popularity which his cousin had been as assiduously throwing away, and the result became apparent in 1399. On his return, in that year, from a military expedition in Ireland, Richard found that Bolingbroke (as Hereford was generally known) had, in his absence, landed in England, that he had placed himself at the head of a formidable army, and that the Duke of York had yielded and gone over to his side. The army which the King had with him in Ireland, also, no sooner landed than it almost entirely passed over to the invader. Meeting the conqueror at Flint Castle, Richard was carried captive in his train to London. On September 29, 1399, he formally resigned his crown. On the following day the resignation was ratified by Parliament, and the crown conferred on Bolingbroke (who had assumed the title of Duke of Lancaster), who was henceforth known as Henry IV. (q.v.). By order of the peers, Richard was confined secretly in various castles. In the February following his resignation, the nation was told that he was dead, and his body, or what was supposed to be it, was brought with much pomp from Pontefract Castle, and shown to the people. There were rumors afterwards of his being alive and in Scotland. It is probable that he was murdered about February 14, 1400. Richard had ability, but was very extravagant, fond of pleasure, and subject to fits of passion. He had some taste for literature and was a patron of Gower, Froissart, and Chaucer. His reign is important on account of the development of the Privy Council (q.v.) and the active rôle played by Parliament. Furthermore it was during this reign that the work of Wiclif (q.v.) bore fruit in the rise of the Lollard (q.v.) movement. Consult: Wallon, *Richard II.* (2 vols., Paris, 1864); Stubbs, *Constitutional History*, vol. ii. (4th ed., Oxford, 1896); Pauli, *Geschichte Englands* (Gotha, 1853-58).

RICHARD III. (1452-85). King of England from 1483 to 1485. He was the youngest son of Richard, Duke of York, and was born at Fotheringay Castle on October 2, 1452. His boyhood was passed amid the struggles of the Wars of the Roses, in which he experienced both imprisonment and exile. In 1461, after the accession of his brother Edward IV. to the throne, he was made Duke of Gloucester, although but a lad of nine years, and throughout the Wars of the Roses he remained faithful to his brother, rendering him most valuable assistance. He rejected the overtures of Warwick, and shared Edward's exile in 1470-71, and in the latter year he commanded the vanguard of the Yorkist's army at the final victories of Barnet and Tewkesbury. For all these services he was richly rewarded. In 1469 he was made High Constable of England, and in 1478 Great Chamberlain, besides receiving numerous other grants and offices. He stood highest in the royal councils, proving a capable statesman, and in 1480-82 he conducted successful campaigns against the Scots, and as Warden of the West Marches he brought that country into such subjection that the Parliament of 1483 granted this office to him and his heirs forever.

Upon his death in the same year Edward IV. left to Richard the care of his heir, Edward V., then but thirteen years old, and the administration of his kingdom. Richard was at the

time in the north, but before his arrival at London he was recognized by the royal council as Protector of the realm. He soon overthrew the unpopular party of the Woodvilles, the Queen's relatives, who aimed to control the Government, and finally imprisoned Edward V. and his younger brother. Parliament thereupon declared that he was the rightful King, on the ground that Edward IV.'s marriage with Elizabeth Woodville was illegal. A deputation of lords and commons presented these conclusions to Richard, who assumed the crown on June 26, 1483. After his accession the King courted popularity with considerable success. He made a royal progress through the midland and northern counties, and was everywhere received with joy and loyalty. While Richard was thus engaged in the north, plots for the rescue of the captive princes were being hatched in the south, and to end these conspiracies Richard about this time probably had his prisoners put to death. The Duke of Buckingham, who was involved in these plots, thereupon planned a rebellion in favor of the Earl of Richmond, the Lancastrian claimant of the throne. A general uprising was planned for October 18th, which was to extend throughout Southern England and Wales, but the King's adherents repressed the insurrection in the south and cut the bridges over the Severn. The heavy autumn rains prevented Buckingham from crossing the river from the Welsh side, and the same storms frustrated the intended invasion by Richmond. Buckingham was taken prisoner and executed.

The remainder of Richard's brief reign was spent in preparations for the final struggle with Lancaster. By wise laws and politic acts he sought to win the affections of the people, and by extensive military preparations to battle the expected invasion. In order to unite the Yorkist party, Richard intended to marry his son and heir to Elizabeth, the eldest daughter of Edward IV., and on the death of his son he proposed marrying her himself, but was obliged to renounce this plan on account of popular opposition. On August 7, 1485, the Earl of Richmond landed at Milford Haven, and was joined by the Welsh chieftains in his advance on Shrewsbury. Richard hastened to meet him, and the hostile armies faced each other on Bosworth Field. When, however, Richard ordered the attack he found his troops half-hearted, and the Stanleys, whom he had summoned to his aid from Lancashire, joined the enemy. The result was that Richard was defeated and slain (August 22, 1485), and the Earl of Richmond became King of England as Henry VII.

There has been much discussion over the character of Richard III. The chroniclers of the following reign, from whom we have derived our knowledge of him, wrote to please the Tudors. They pictured him as a monster, both physically and morally, and the genius of Shakespeare has fixed this conception in the public mind. He is said to have been undersized and a hunchback, with his left shoulder lower than the right. His look was said by Polydore Virgil to be full of malice and deceit, and by Sir Thomas More to be warlike and hard-favored. But contemporary portraits, of which several survive, show a thoughtful, anxious face, and no trace of deformity. A hunchback could not have performed the feats of valor which he accomplished at

Barnet, Tewkesbury, and Bosworth. But of his unscrupulous character there can be no doubt, although many of the accusations of his enemies are unfounded. He and his brother Clarence were said to have caused the death of Edward, the heir of the House of Lancaster, after the battle of Tewkesbury. But even if this be true there were many similar executions in the Wars of the Roses. There is nothing to prove that he caused the murder of Henry VI., or had any part in the accusation and conviction of his brother Clarence. From all these deaths Edward IV., and not Richard, was chief beneficiary. The murder of his two nephews in the Tower was, however, quite generally ascribed to Richard's orders, and probably with more reason. But of the supposed murder of his wife there is little likelihood. Whatever his moral character, he was certainly a ruler of great ability. His management of the Scotch war and his government of the north before his accession to the throne brought him the greatest popularity, and his legislation after his accession to the throne was wise and beneficent.

BIBLIOGRAPHY. *Letters and Papers of the Reigns of Richard III. and Henry VII.*, ed. James Gairdner (Rolls Series, 1861-63), which are the most important of the sources. Among the Tudor historians, consult: More, *History of King Richard III.* (new ed., Cambridge, 1833); Virgil, *Anglia Historiarum Libri VIII.* (new ed., Leyden, 1861); Fabyan, *The Year Chronicles of England and France* (London, 1811); Ross, *Historia Regum Anglia* (Oxford, 1716). The best modern account of his reign is by Gairdner, *Life and Reign of Richard III.* (Cambridge, 1898). The most elaborate defense of Richard's character is Legge, *The Unpopular King: Life of Richard III.* (London, 1835). The question of the murder of the princes was discussed by Markham in the *English Historical Review*, vol. vi. (London, 1891), who believed Henry VII. committed the deed. He was answered by Gairdner in the same periodical and same volume.

RICHARD II. An historical tragedy by Shakespeare, written probably in 1595, and entered on the *Stationers' Register* in 1597. Excepting the adapted plays on Henry VI., it is the earliest of the historical plays, and the first printed. It was probably the play acted the night before Essex's rebellion in 1601. The suggestive deposition scene made it unpopular at Court, and it was suppressed by the censorship, being first printed in the Fourth Quarto in 1608. Several older plays on Richard II. had been written, but were not used by Shakespeare. The chief source of the tragedy was Holinshed's *Chronicle*, and its model was Marlowe's *Edward II.* Among the historical plays, it stands as a prologue to the dramas of Henry IV. and V.

RICHARD III. An historical tragedy by Shakespeare, written about 1595, and entered in the *Stationers' Register* in 1597, shortly after *Richard II.* An older play, *The True Tragedy of Richard III.*, was published in 1594, but from this Shakespeare took only two lines. He followed Holinshed's *Chronicle* (1577), who took the sombre picture of Richard from Sir Thomas More's *History of Richard III.* Traces of a weaker hand can be detected, and it is supposed that Marlowe helped in the early part of the play, which was finished and later revised by Shakespeare. Historically it follows closely on

1100-11, and completes the series dealing with the Wars of the Roses.

RICHARD, EARL OF CORNWALL (1209-72). King of the Romans (of Germany) from 1257 to 1272. He was the second son of King John of England by Isabella of Angoulême. In 1225 he was created Earl of Cornwall by his brother Henry III. In the same year he led a successful expedition into Gascony. In 1240 he went on a crusade, but accomplished little because hindered by lack of support from the military orders. He received many grants from the King at various times, and amassed enormous wealth, mainly through the possession of the tin mines of Cornwall, which gave him great power in political matters. In 1253 and 1254 he was Regent of England. (See HENRY III.) In 1257 Richard was elected by some of the German princes King of Germany, Alfonso X. of Castile (q.v.) being elected by a rival party. Richard was crowned at Aix-la-Chapelle. He gradually won recognition throughout the Rhineland, but not elsewhere. In 1259 he was forced to return home to raise money, and took an oath to observe the Provisions of Oxford (q.v.). In the great struggle which took place between Henry III. and his nobles, Richard at first acted the part of a mediator; subsequently, however, he took a decided part with his brother against the party which was headed by Simon de Montfort, and on May 14, 1264, he was taken prisoner by that leader at the battle of Lewes. Montfort shut him up in Kenilworth Castle, from which he was released after the battle of Evesham in 1265. The murder of his eldest son, Henry of Almaine, by the son of Simon de Montfort, hastened his death, which occurred on April 2, 1272. Consult: Koch, *Richard von Cornwall, 1209-57* (Strassburg, 1888); Lorenz, *Deutsche Geschichte im 13. und 14. Jahrhundert* (Vienna, 1863-67); Schirrmacher, *Die letzten Hohenstaufen* (Göttingen, 1871).

RICHARD DE BURY. See BURY, RICHARD DE.

RICHARD OF CIRENCESTER (1335?-1401?). An early English chronicler. Little is known of his life. He was probably born about 1335, and in 1355 was a monk in the Benedictine monastery of Saint Peter's, Westminster, where he spent his life, and died in 1400 or 1401. He devoted himself to the study of early British and Anglo-Saxon history and antiquities, and is said to have visited many libraries and ecclesiastical establishments in England in the prosecution of his investigations. In 1391 he obtained a license from his abbot to make a pilgrimage to Jerusalem. Richard's principal work is the *Speculum Historiale de Gestis Regum Angliæ*, in four books, covering the period 447-1066. It is a compilation and not very carefully done. Consult the edition from the copy in the public library, Cambridge, by Mayer in the *Rolls Series* (2 vols., London, 1863-69). A treatise on the ancient State of Great Britain, *Ricardus Corinensis de Situ Britannie* (Copenhagen, 1757), was long accepted as a genuine work of Richard, but is now considered to have been a forgery by Charles Bertram.

RICHARD OF SAINT VICTOR (?-1173?). A scholastic and mystical theologian, born in Scotland. He entered the cloister of the Augustinian canons of Saint Victor, near Paris, under

its first abbot, who died in 1155, and rose to be prior in 1162. His numerous writings, collected in Migne, *Patrologia Latina*, exevi., may be divided into exegetical (in which he follows the allegorical and mystical interpretation), dogmatic, and miscellaneous. In the second the masterpiece is the six books on the Trinity; in the third appear his letters. Like other mystics, he considers divine grace as the ultimate source of knowledge, and the highest object of study is God Himself. Consult: J. B. Hauréau, *Histoire de la philosophie scholastique* (Paris, 1872-80); Kaulich, *Die Lehren des Hugo und Richard von Saint Victor* (Prague, 1864).

RICHARDS, BRINLEY (1817-85). A British pianist and composer, born at Carmarthen, Wales. A student at the Royal Academy of Music, London, he won the King's scholarship there in 1835 and in 1837, and soon became known as a lecturer on Welsh music, and as a pianist. He taught in the Royal Academy, and composed an orchestral overture which was performed in Paris in 1840, and in London the following year; supplementary songs for the English production of Auber's *Crown Diamonds* (1846), besides pianoforte pieces, part-songs, and sacred solos.

RICHARDS, ELLEN HENRIETTA (SWALLOW) (1842-). An American sanitary chemist, born at Dunstable, Mass. She studied at Vassar (1867-70), and then entered the Massachusetts Institute of Technology as a special student. In 1875 she married Robert Hallowell Richards (q.v.), and in 1884 she was appointed instructor in sanitary chemistry in the Institute of Technology. She wrote: *Chemistry of Cooking and Cleaning* (1882); *Food Materials and Their Adulterations* (1886); *Home Sanitation* (1887, with Talbot); *The Cost of Living* (1899); and *Air, Water, and Food* (1900).

RICHARDS, JOSEPH WILLIAM (1864-). An American metallurgist, born in Oldbury, England. He graduated at Lehigh University in 1886, and returned there, after courses in Heidelberg and Freiburg, as assistant professor of mineralogy and metallurgy. He was a member of the United States Assay Commission in 1897, and attained prominence as a legal expert in chemical and metallurgical cases. He wrote *Aluminium* (1887).

RICHARDS, ROBERT HALLOWELL (1844-). An American mining engineer and metallurgist. He was born at Gardiner, Maine, graduated at the Massachusetts Institute of Technology in 1868, and in 1871 was appointed its professor of mining and metallurgy. Richards built up the laboratories in these two courses; invented jet pumps for use in physical and chemical laboratories (1873), and ore separators for Lake Superior copper (1881) and Virginia iron. In 1901 he published *Ore Dressing*.

RICHARDS, THEODORE WILLIAM (1868-). An American chemist, born in Germantown, Pa., a son of the artist William Trost Richards (q.v.). He was educated at Haverford College and at Harvard, where, after studies in Germany, he became assistant professor of chemistry in 1894. Richards was a member of the National Academy of Sciences and a special student of the atomic weights of the metals.

RICHARDS, THOMAS ADDISON (1820-1900). An American landscape painter, born in London.

He came to the United States in 1831 with his parents, who first settled in Georgia. They removed to New York City in 1845, where Richards afterwards lived, and where he studied at the National Academy of Design. In 1858 he was made director of the Cooper Union School of Design for Women, and in 1867 became professor of art in the University of New York. He was elected to the National Academy of Art in 1851. He was also known as an illustrator, and wrote several works on art, and some illustrated hand-books of travel.

RICHARDS, WILLIAM (1792-1847). An American missionary. He was born at Plainfield, Mass., graduated at Williams College in 1819, and passed to the Theological Seminary at Andover. In 1822 he was sent as a missionary to the Sandwich Islands, and by the close of 1830 the native church numbered nearly 300 communicants. In 1838 Mr. Richards added to his regular religious duties the offices of interpreter, translator, and chaplain to the King. He visited England and several other foreign courts as special ambassador, and after his return in 1845 became Minister of Public Instruction, having care of all schools, Catholic and Protestant, and occupying a seat in the King's Privy Council. Consult Sprague, *Annals of the American Pulpit* (New York, 1866).

RICHARDS, WILLIAM TROST (1833—). An American landscape and marine painter, born in Philadelphia. He was a pupil of Weber, in his native city, and afterwards traveled and studied in Europe. He exhibited at the Royal Academy and the Salon, and became an honorary member of the Academy of Design. His marine pictures are especially popular, and he is a skillful, if somewhat monotonous, painter of water. His works include: "On the Coast of New Jersey" (1883), in the Corcoran Gallery, Washington; and "The Bell Buoy," in the Pennsylvania Academy of Fine Arts. There are also several of his landscapes and marines in the Metropolitan Museum of Art, in New York City.

RICHARDSON, SIR BENJAMIN WARD (1828-96). An English physician and author. He was born at Somerby, in Leicestershire, and was early apprenticed to the surgeon of his native town. In 1850 he became a licentiate of the Faculty of Physicians and Surgeons of Glasgow, and later received the degrees of A.M. and M.D. at Saint Andrews. He devoted his attention particularly to sanitary matters and to methods of alleviating pain, for the latter object introducing at least 14 anaesthetics, including methylene bichloride and the use of ether spray. For his services in this direction he was knighted in 1893. Among his numerous works, which are by no means confined to medical subjects, are *The Health of Nations* (1887) and *National Health* (1890).

RICHARDSON, CHARLES (1775-1865). An English lexicographer. He studied law, but he early gave up that profession. For many years he kept a school at Clapham, near London. This he gave up in 1827 to devote himself wholly to the study of language. In 1853 he was granted a civil list pension of £75 a year. As a philologist he was a follower of Horne Tooke (q.v.). In 1818 he contributed to the *Encyclopaedia Metropolitana* the first parts of an English lexicon, afterwards enlarged to the *New English Dictionary* (pub. in 30 parts, 1835-37; supple-

ment issued in 1856), long the standard English dictionary in England. It also had a wide sale in the United States. Though about as faulty as a dictionary could be, it has furnished better equipped lexicographers with many quotations. An abridged edition appeared in 1839. Richardson also produced: *Illustrations to English Philology* (1814); *On the Study of Language* (1854); and other books on language. He contributed to the *Transactions of the Magazine and Notes and Queries*. Richardson was sharply criticised by Noah Webster in *Mistakes and Corrections* (1837).

RICHARDSON, CHARLES FRANCIS (1851—). An American literary critic and historian. He graduated at Dartmouth College in 1871, was on the editorial staff of the *Independent* (1872-78) and the *Sunday School Times* (1878-80), editor of *Good Literature* (1880-82), and afterwards professor of English in Dartmouth College. His books include: *A Primer of American Literature* (1876); *The Cross*, a volume of poems (1879); *The Choice of Books* (1881); and an elaborate account of *American Literature* (1887-88). In 1902 he edited the Arden edition of Poe's works.

RICHARDSON, CLIFFORD (1856—). An American chemist, born at Worcester, Mass. He graduated at Harvard in 1877. As assistant chemist to the United States Department of Agriculture (1878-87) and as inspector of asphalts and cements in the engineering department at Washington, he wrote Government reports on cereals (1883-86), on spices and condiments (1887), and on asphaltum (1894). He became a member of the Association of Official Agricultural Chemists, and contributed to the *Proceedings* of that body. In 1896 he was appointed superintendent of tests to the Barber Asphalt Paving Company, of Long Island City, N. Y.

RICHARDSON, ERNEST CUSHING (1860—). An American librarian and author, born at Woburn, Mass. He graduated at Amherst in 1880, pursued special courses at Washington and Jefferson College, and studied theology at the Hartford Theological Seminary, where he taught and was librarian from 1883 until 1890, when he was appointed librarian at Princeton. He was chosen vice-president of the American Library Association, contributed to Barner's *Jahresberichte der Geschichtswissenschaft*, edited *Hieronymus and Gennadius de Viris Illustribus* (1896), and wrote *Influence of the Golden Legend on the Culture*, *History of the Middle Ages* (1887); *Lois and the Clementine Recognitions* (1894); and other works upon historical and literary subjects, besides numerous articles of interest to specialists in library work. His lectures before the New York State Library School Association were published in 1901 under the title, *Classical, Theoretical and Practical*.

RICHARDSON, HENRY HOBSON (1838-86). An American architect, born at Priestley's Point, Saint James's Parish, La. He graduated at Harvard in 1859, traveled in Europe, studied architecture at the Beau Arts, during a portion of his course was employed in the offices of a Government architect, and having returned to the United States in 1865, began the active practice of his profession in 1866 as a member of the firm of Gambrell & Richardson of New York City. In 1875 he removed to Brookline, Mass.

He was a member of the American Institute of Architects, of the American Academy of Arts and Sciences, of the Archaeological Institute of America, and an honorary and corresponding member of the Royal Institute of British Architects. Among the more important structures designed by him are Trinity Church, Boston, especially notable for its large central tower; the Brattle Street Church of Boston, remarkable also for a fine tower ornamented with a frieze of colossal sculptures; the City Hall, Albany, N. Y.; the New Law School for Harvard University; the Allegheny County buildings, at Pittsburg, Pa.; the Chamber of Commerce, Cincinnati, Ohio; and numerous public library buildings and railway stations. He established the successful use in American architecture of the Romanesque styles of Southern France, Auvergne in particular. It has been said that no modern architect more fully understood the value of sculpture in its application to buildings, and in the repose of his manner he is noteworthy among recent designers. His distinguishing qualities are breadth, unity, and simplicity; his principal defects an occasional carelessness of technique, and a tendency toward a grotesque manifestation of largeness and strength. His influence on his profession in the United States was very great, and his work may be considered to represent the nearest approach to a definite American style. In his Brookline workrooms he trained many students. Consult the biography by Van Rensselaer (Boston, 1888).

RICHARDSON, JAMES (1806-51). An English traveler and philanthropist, born in Lincolnshire. He early became interested in the suppression of the African slave trade, and, under the patronage of the English Anti-Slavery Society, edited a newspaper at Malta. He soon determined, however, to visit the interior of Africa in order to learn the causes of the slave trade, and, if possible, its remedy. He accordingly entered Morocco, but was unable to penetrate the interior. In 1845 he succeeded in reaching Ghadames and Ghat. On his return to England in 1847 he was aided by the Government in fitting out an expedition, and in March, 1850, accompanied by two Germans, Barth and Overweg, he left Tripoli, with the intention of exploring Lake Tchad. At Damerghon the three explorers separated, hoping to meet again on the shores of the lake. But while still two weeks' journey from the rendezvous, Richardson was prostrated by fever and died at Ungouratona on March 4, 1851. His papers, including his journal down to February 21st, were published under the title, *Mission to Central Africa, 1850-51, Under the Order of Her Majesty's Government* (1853). Richardson also wrote *Travels in Morocco* (1860) and *Travels in the Desert of Sahara, 1845-46* (1848).

RICHARDSON, JOHN (1787-1865). A British Arctic explorer and naturalist, born at Dumfries, Scotland. He was educated in the academy of his native town and studied medicine at the University of Edinburgh, where he obtained a surgeon's diploma in 1807. The same year he entered the Royal Navy as assistant surgeon, and was present at the battle of Copenhagen. Subsequently he served on the coast of Africa, on the Baltic and North Sea stations; afterwards in Canada, and in 1815 in Georgia, having charge

of the hospital-ship for the sick and wounded of the brigade. In 1816 he received his M.D. degree from Edinburgh University and in 1819 was appointed surgeon and naturalist to the overland Polar expedition under Franklin. In 1825-27 he accompanied Franklin in his overland expedition to the mouth of the Mackenzie, and by orders of the Admiralty was detached to survey the coast between that river and the Coppermine. In 1846 Richardson was knighted. Two years later he was appointed to command the search for his former traveling companion, Sir John Franklin, of whom nothing had been heard for upward of two years. On March 25, 1848, Richardson, accompanied by Dr. Rae, left Liverpool and traveled via New York, Montreal, and the Canadian lakes to look for the missing expedition between the Mackenzie and Coppermine rivers. Reaching the headwaters of the Mackenzie, they descended the river to its mouth and then turned eastward by Capes Bathurst and Parry. With immense labor through dangerous drift-ice the party reached Cape Hearne, where they were obliged to abandon the boats, and after twelve days' fatiguing march, through half-frozen swamps and over hills covered with snow, they succeeded in gaining Fort Confidence, at the north point of Great Bear Lake. Here Richardson spent the winter in scientific observations, and, leaving Dr. Rae in command, returned to England in 1849, resuming his duties at Haslar. In 1855 Richardson resigned his office and devoted himself to literary work at Grasmere, where he died June 5, 1865.

Richardson contributed largely to the account of Franklin's first expedition (London, 1823); and to that of the second expedition (ib., 1828). His most important works are: *Fauna Boreali-Americana* (1829-37); *An Arctic Searching Expedition: A Journal of a Boat Voyage Through Rupert's Land and the Arctic Sea* (1851); *The Polar Regions* (1861).

RICHARDSON, SAMUEL (1689-1761). An English novelist, born in Derbyshire. His father was a joiner, who desired to educate his son for the Church; but this he could not afford, so at the age of sixteen, with such an education as a country school could furnish, the young man went to London, where he became apprentice to one John Wilde, a printer. In the discharge of his duties he was exact and careful, and on the expiration of his apprenticeship he became foreman. In 1719 he started as a printer on his own account, first in Fleet Street, and soon afterwards in Salisbury Court; and, on finding his success assured, he married Martha, daughter of Allington Wilde—not Richardson's former master. In 1754 he became master of the Stationers' Company and in 1760 he purchased the half interest of the patent of King's printer. He died July 4, 1761.

Till he had turned fifty, Richardson's relations with literature, except in the way of printing, were of the most slight and amateur kind; but in 1740, a year after two booksellers, Rivington and Osborne, had proposed to him that he should write a volume of familiar letters as patterns for youths and maidens in the country, Richardson surprised the world with his *Pamela*, which had instant and great success. Hughes may have given Richardson a hint for his *Pamela* in a story told in the *Spectator* (375). Its continuation, to which

the author was stung by the issue of a pretended sequel, entitled *Pamela in High Life*, was, however, pronounced much inferior. *Pamela* suggested to Fielding his *Joseph Andrews*, originally conceived as a parody of Richardson's somewhat prudish moralities. The satire was not appreciated by Richardson, and he never forgave Fielding. In 1747-48 Richardson issued, in eight volumes, *The History of Clarissa Harlowe*—by common consent his masterpiece—a work which in its progress to completion aroused the most intense interest. His third and last great work, *The History of Sir Charles Grandison*, was published in 1753. As a whole, this is less interesting, and in his representation of the life of the fashionable classes, of which he had no clear personal knowledge, the writer succeeds but indifferently. Richardson had some knowledge of architecture. He has also been said, but groundlessly, to have studied at Christ's Hospital. Of the classic languages he had no more than a smattering. During his boyhood at least he seems to have been bashful and to have cared little for games, but he liked well to read when he had the time. He was a worthy apprentice and a good master, cautious, moral, and kind. He helped poor authors and was praised by Dr. Johnson for having "taught the passions to move at the command of virtue." Richardson dwelt for a while in a country house at North End, Hammersmith. Here he composed most of his novels.

Richardson's method of minute elaboration is somewhat wearisome. Moreover, the epistolary form which he chose, though it had certain advantages, led to novels of immense length. But there are singular sources of attraction in the depth and simplicity of Richardson's sentiment, his profound knowledge of the heart, and his mastery of elemental emotion, and in virtue of the overwhelming effects of pathos in which the interest of his *Clarissa* culminates, a place must be assigned him among the potent masters of genuine tragic passion. His specialty lies in subtle analysis of the feminine heart, and in this particular field he has hardly been surpassed. It seems to have been his instinct to cultivate a curious sort of passionless confidential intimacy with women: throughout life he was the centre of a circle of female friends and admirers, who came to him with their little delicate secrets, as to a kind of lay father confessor; and the fruits of his nice observation of them he has given us to the full in his novels. Richardson is thus the first outright psychologist in English prose fiction. He also created great character types, as Lovelace and Clarissa. His popularity was very great, both in England and on the Continent. He shaped the novel for a half century, and is still a force. Consult his works edited by Leslie Stephen (12 vols., London, 1883), and by Phelps with *Life* (New York, 1901); *Compendium*, edited by Barbauld (6 vols., London, 1804); Thomson, *S. Richardson: A Biographical and Critical Study* (ib., 1900); Dobson, *Richardson* (New York, 1902); Texte, *Jean-Jacques Rousseau et le cosmopolitisme littéraire au XVIII^e siècle* (Paris, 1895), translated into English as *Jean Jacques Rousseau and the Cosmopolitan Spirit in Literature* (London, 1899). See NOVEL.

RICHARDSON, WILLIAM ADAMS (1821-96). An American jurist, born at Tyngsborough,

Mass. He graduated at Harvard in 1843, and was admitted to the bar in 1846. In 1855 he was appointed to revise the Massachusetts Statutes, and subsequently edited the annual supplements to the State General Statutes. In 1869 he became Assistant Secretary of the United States Treasury, in 1871 visited Europe as agent for the sale of the United States funded loan, and in 1873 became Secretary of the Treasury. In 1885 he was appointed Chief Justice of the Court of Claims, and at one time he was a professor in the Georgetown Law School. He published: *The Banking Laws of Massachusetts* (1855); *Practical Information Concerning the Debt of the United States* (1872); *National Banking Laws* (1872); and *History of the Court of Claims* (1882-85).

RICHARDT, rik'sh'it, CHRISTIAN ERNST (1831-92). A Danish poet and dramatist, born in Copenhagen, noted for deep and refined feeling, and spiritual and patriotic fervor. He was a pastor. His comedy *Declarations* (1851) was followed by *Short Poems* (1861); *Pictures and Songs* (1874); *Fifty Poems* (1878); *King and Constable*, a musical drama (1878); *Spring and Autumn*, poems (1884); and *Miscellaneous Poems* (1891). *The Holy Land* (5th ed., 1889) was the fruit of a trip to the Orient. His *Samlde Digte* (or *Collected Poems*) were published in three volumes in 1894.

RICHELIEU, rîsh'li-ew' or -lyé'. A river of Canada (also called Chambly, Saint John, and Sorel). It is the outlet of Lake Champlain and flows into the Saint Lawrence River at Sorel on Lake Saint Peter, and has a straight course of 80 miles, ranging from 1000 feet to 1½ miles in width, through a picturesque and historic country (Map: Quebec, C 5). It is navigable to Chambly, whence a canal to Saint John obviates the rapids lying between.

RICHELIEU, rîsh'lyé', ARMAND EMMANUEL DU PLESSIS, Duke de (1766-1822). A French statesman, grandson of Marshal Richelieu (1696-1788), born in Paris and educated at the College of Plessis. He left France at the beginning of the Revolution, entered the Russian service, under Suvarov, and became lieutenant general. Alexander I. made him Governor of Odessa in 1803, but after a brilliant administration there he returned to France in 1815 to form a new Ministry under Louis XVIII. His influence with the allied powers enabled him to secure the withdrawal of their troops from France, and he was chief of Cabinet until 1818, when he resigned on account of his unsuccessful attempt to change the electoral law, according to his promise to the powers. He was recalled in 1820, retired within two years, and died shortly afterwards, the last of his name. Consult D'Asfeld, *Leaves et souvenirs du duc de Richelieu* (Paris, 1827).

RICHELIEU, ARMAND JEAN DU PLESSIS, Duke de, Cardinal (1585-1642). An eminent French statesman, born in Paris, September 5, 1585. He was educated for the army at the Collège de Navarre, but turned to the study of theology in order that he might succeed his elder brother as Bishop of Luçon. This he was able to do on the latter's retirement in 1606, and on April 16, 1607, the youthful prelate was consecrated at Rome in the presence of Pope Paul V. He devoted himself with earnestness to the work of his

dances and was successful as a preacher and administrator. As one of the representatives of the clergy at the States-General in 1614 he attracted the notice of the Queen mother, Maria de' Medici, by an address delivered in the presence of the young King, Louis XIII. He was made one of the Court almoners, and later, in 1616, entered the Royal Council as Secretary for War and Foreign Affairs. The overthrow of Concini and the party of the Queen mother, and the rise of the royal favorite, De Luynes, to power, sent Richelieu temporarily back to his bishopric. De Luynes died in 1621, while carrying on a campaign against the Huguenots, leaving the kingdom in great disorder. The nobility were in revolt and strengthening themselves in the provinces, the Huguenots were in arms, and the influence of France in Europe was threatened by the growing ascendancy of the House of Austria. Reconciled to her son, mainly through the diplomacy of Richelieu, who had remained her trusted counselor, Maria de' Medici obtained for the latter a cardinal's hat, and in 1624 he was recalled to the council. He soon became the chief Minister of State and retained that post until the end of his life—the real head of France in everything but name. In bringing about the reconciliation Richelieu had been greatly assisted by the Capuchin Father Joseph (q.v.), who remained afterwards his confidential assistant.

The new Minister's first important measure was the arrangement of a marriage between the King's sister, Henrietta Maria, and the Prince of Wales, afterwards Charles I. This assured friendly relations with England. It was necessary for Richelieu to suppress the Huguenots as a political faction, to reduce the disturbing nobles to obedience, and to restore the prestige which France had won under Henry IV. in the affairs of Europe. While carrying out the first of these objects he made alliances with and gave encouragement to the Dutch and German enemies of the Catholic House of Austria. He regarded the Protestants at home or abroad wholly with the eye of a statesman, and had no religious prejudices. As the power of the Cardinal increased Maria de' Medici became antagonistic. The King trusted him implicitly, but never liked him personally, and always was restive under the mastery of this greater mind. Richelieu's policy was directed toward a unified system of administration in France, and in foreign affairs his chief aim was to humble the power of the Austrian and Spanish Hapsburgs. Richelieu was instrumental in bringing Gustavus Adolphus (q.v.) into Germany, and during the later years of the Thirty Years' War France was an active ally of the Protestant cause in the field. (See THIRTY YEARS' WAR.) In 1628 the rebellious Huguenots were put down and La Rochelle was taken, after a siege of fifteen months, during which Richelieu commanded in person with great ability. After this triumph he showed the quality of his statesmanship by his liberality and clemency toward the conquered. In Italy France combated Austria and Spain in the War of the Mantuan Succession (1628-31), and Richelieu's diplomacy secured the recognition of the claims of Charles of Nevers. The ill will of the Court nobles whom Richelieu's influence had deprived of power over the weak King showed itself in fre-

quent conspiracies against the Cardinal. Gaston of Orleans, brother of Louis XIII., played a leading part in these plots, which Richelieu, thanks to his system of espionage, punished relentlessly. The so-called conspiracy of Chalais ended in death for some of the leaders and imprisonment for others. A second great conspiracy, headed by the Queen mother, reached its crisis on November 11, 1630, when Richelieu himself had almost given up the struggle. The King refused him an audience, but Louis having withdrawn to Versailles, the Cardinal succeeded in seeing him there, overcame the influence of his enemies, demonstrated his necessity to France, and irrevocably fixed his ascendancy. The day became known, from the discomfiture of the conspirators, as 'the day of dupes.' In 1631 the Duke of Montmorency (q.v.) rose against the Cardinal, only to perish on the scaffold. In the last years of his life Richelieu crushed the rising of the Count of Soissons and defeated the conspiracy of Cinq-Mars (q.v.). The later administration of Richelieu formed an important epoch in the history of the constitution of France and in her foreign relations. By a succession of vigorous and effective measures he succeeded in breaking down the political power of the great families of France and making the King an absolute ruler. The policy of war against Austria and Spain vindicated itself in its ultimate results, which, however, Richelieu did not live to see.

The character of Richelieu is one of those that moralists and historians delight to discuss. There is no question but that he was unscrupulous in the means that he used. There is equally no question that he used these means with a singleness of purpose for what he believed to be the good of France and his King. His policy was successful in developing the greatness and the power of France, but burdensome impositions were necessary to meet the enormous expenditures it entailed, and the unchecked absolutism that he fastened upon the country was in the long run a misfortune. What the France of his day justly feared, as a result of the melancholy experiences of two generations, was anarchy and a powerless executive. That danger Richelieu averted, but he went too far toward the other extreme. The variety and scope of his talents were remarkable. His writings fill several volumes, and some of them have much merit. Of the later ones his *Testament politique* and his *Mémoires* are most important. He also indulged in lighter literary diversions, and in the drama, but left nothing noteworthy. He was a liberal patron of literature, and to him France owes the founding of the French Academy. (See INSTITUTE OF FRANCE.) The *Palais Cardinal*, later known as the *Palais Royal*, was his Paris residence. He was as capable a military commander as he was a churchman, a civil administrator, and a diplomat. At the siege of La Rochelle he is said to have been his own engineer-in-chief. His *Lettres*, *instructions diplomatiques*, etc., were edited by d'Avenal (8 vols., Paris, 1853-77).

(Leipzig, 1876-77); Topin, *Louis XIII. et Richelieu* (Paris, 1885); d'Arvencel, *Richelieu et la monarchie absolue* (ib., 1884-90); Dussieux, *Le cardinal de Richelieu* (ib., 1885); Fagniez, *Le père Joseph et Richelieu* (ib., 1894); Hanoteaux, *Histoire du cardinal de Richelieu* (ib., 1893-96); and Perkins, *Richelieu and the Growth of French Power* (London, 1900).

RICHELIEU, LOUIS FRANÇOIS ARMAND DU PLESSIS, Duke de (1696-1788). A marshal of France, born in Paris, a grandnephew of the great Cardinal. He took an active part in Court intrigues and was comrade and assistant to Louis XV. in his love affairs. As a soldier he distinguished himself at Fontenoy. He was made marshal in 1748, Governor of Guyenne in 1755, and won great renown in the taking of Port Mahon, Minorca, in 1756. He succeeded Marshal D'Estrées as commander in Hanover, where he enriched himself by pillage and permitted his troops to do the same. His later days, as his earlier, were occupied with the dissipation of the royal circle at Paris. He was a witty, if not a wise man, and the friend and protector of Voltaire, but better known for his patronage of Du Barry and for his utter lack of seriousness. His memoirs were edited by Soullavie in 1793; and he is prominent in most other memoirs of the period. Consult Faur, *Vie privée du maréchal de Richelieu* (Paris, 1792).

RICHEPIN, rêsh'pân', JEAN (1849-). A French poet, novelist, and dramatist. He was born at Médéah, in Algeria, February 4, 1849. For a while he was a sailor, and he fought as a rifleman in the Franco-German wars. He at first studied medicine and then entered the Ecole Normale in Paris. After an apprenticeship in journalism, fiction, and drama he published (1876) *La chanson des guêpes*, for the frank immorality of which he was fined 500 francs and imprisoned one month. In prison he wrote *Les mortes bizarres* (1877). Among later works are the poems *Les caravans* (1877), *Les blasphèmes* (1884), *La mer* (1886), *Mes paradis* (1893); the stories *La Glu* (1881); *Braves gens* (1888); the plays *Nana Sahib* (1882), *Monsieur Scapin* (1886), *Le flibustier* (1888), *Par le glaive* (1892), *Les triaunds* (1889). Richepin is a romantic, and a poet and notably a dramatist of talent. *Par le glaive* is a noble and beautiful drama written in fine, sonorous Alexandrines.

RICHER, rêshâ', EDMOND (1560-1631). A French theologian, born at Chaource, Aube. He was made a doctor of theology by the Sorbonne, and taught belles-lettres, rhetoric, and philosophy in the college of Cardinal Le Moine, of which he became director in 1594. The following year he came forward prominently as the chief opponent of the Jesuits, who in their turn attacked his work *De Ecclesiastica et Politica Potestate* (1611), and he was forced to resign as syndic of the Sorbonne in 1612. He was summoned to appear before the Inquisition at Rome, and was imprisoned on his return to Paris, but was released. He made his defense in *Historia Conciliorum Generalium* (1683), and *Histoire du syndicat de Richer* (1753), both published posthumously. He also wrote *De Analogia, Causis*

Philosophicæ et Logica, Patra, Locupletanda Verbo (1601), and other works.

RICHER, PAUL (1849-). A French neurologist, born at Chartres. He was educated in Paris, from 1882 to 1896 was director of the laboratory connected with the Salpêtrière clinic of nervous diseases, and in 1898 was elected to the Academy of Medicine. He wrote *Études cliniques sur la grande Épilepsie* (1885, crowned by the Institute), but he is perhaps better known for his connection with art and anatomy. A pupil of Charcot, and a draughtsman of some ability, he published in collaboration with his master, *Les démonsiaques d'un Part* (1886) and *Les difformes et les malades dans l'Art* (1889); and, alone, an *Avant-projet artistique* (1890), which was crowned by the Academy of Fine Arts and by the Academy of Sciences, and *Physiologie artistique de l'homme en mouvement* (1895).

RICHET, rêshâ', ALFRED (1816-91). A French surgeon, born at Dijon. He rose rapidly in his profession, became a member of the Academy of Medicine in 1865, did good service in the ambulance corps in the siege of Paris, and in 1873 was commander of the Legion of Honor. Long professor of clinical surgery, Richet wrote *Traité pratique d'anatomie médico-chirurgicale* (1857), and among special treatises, *Léçons cliniques sur les fractures de la jambe* (1875).

RICHET, CHARLES (1850-). A French physiologist, son of the preceding. He was born and educated in Paris, was a prominent member of the French Biological Society (1881 et seq.), and received in 1879 a prize from the Institute for his monograph, *Propriétés chimiques et physiologiques du suc gastrique*. In 1887 he succeeded Bécларd as professor of physiology in the medical faculty of the University of Paris, and in 1899 was chosen a member of the Academy of Medicine. His works include: a translation of Harvey on the circulation of the blood (1879); *L'homme et l'intelligence* (1884; 2d ed., 1890); *Essai de psychologie générale* (1888; 2d ed., 1892; Russian translation in 1889 and Polish, 1890); and a *Dictionnaire de physiologie* (1899).

RICHFIELD SPRINGS. A village in Otsego County, N. Y., 35 miles southeast of Utica, near Canadarago Lake, and on the Delaware, Lackawanna and Western Railroad (Map: New York, E 3). The mineral springs of the vicinity are noted for their medicinal properties, and are much frequented. Beautiful scenery and attractive drives are to be noted here. There are manufactures of Scotch caps and knit goods. Though settled as early as 1798, Richfield Springs did not become a summer resort until 1820. Population, in 1890, 1623; in 1900, 1537.

RICH HILL. A city in Bates County, Mo., 85 miles south by east of Kansas City, on the Missouri Pacific and the Kansas City, Fort Scott and Memphis railroads (Map: Missouri, B 3). It is situated in the mineral belt of south-west Missouri, in the section noted for its extensive coal fields. Rich Hill carries on considerable trade in farm produce and live stock, and has zinc and lead smelting works, machine shops, manufactures of vitrified brick and tile, and flour mills. Population, in 1890, 4008; in 1900, 4053.

RICHIBUCTO. *richibuk'tó.* A town and port of entry of Kent County, New Brunswick, Can., on Richibucto Harbor and on the Inter-Canadian Railway, 25 miles east of Kent Junction (Map: New Brunswick, E 3). It is the eastern terminus of the Kent Northern Railway. It has shipbuilding, lumber, and fishing industries. Population, in 1901, 4000.

RICH'MOND. A city of Bourke County, Victoria, Australia, constituting a suburb of Melbourne (q.v.). Population, in 1889, 37,550; in 1901, 37,722.

RICHMOND. A town in Surrey, England, 8 miles west-southwest of London, on the right bank of the Thames (Map: England, F 5). It is a favorite summer resort for Londoners. The rich and beautiful scenery of the vicinity is seen with advantage from the Terrace, which stretches along the brow of the hill, on the slopes and summit of which the town is built. The banks of the Thames are studded with villas, and around the town are numerous nurseries and kitchen gardens. As Sebene or Sheen, Richmond was a royal residence from the time of Edward I. until the reign of James II. To the southeast of the town is Richmond Park, presented to the citizens of London by Charles I. in 1634. Richmond was not incorporated until 1890, but had been favored with a progressive vestry which established a water supply, public baths, and a free library. The municipality has built a fine town hall, artisans' dwellings, technical school, and isolation hospital, and maintains cemeteries, sewage works, and pleasure grounds. Population, in 1891, 26,875; in 1901, 31,677. Consult: Chancellor, *Historical Richmond* (London, 1885); Garnett, *Richmond* (ib., 1896).

RICHMOND. A city and the county-seat of Wayne County, Ind., 69 miles east of Indianapolis, on the Whitewater River, here crossed by iron bridges, and on the Pittsburg, Cincinnati, Chicago and Saint Louis, the Grand Rapids and Indiana, and the Cincinnati, Richmond and Muncie railroads (Map: Indiana, E 3). It is the seat of Earlham College (Orthodox Friends), opened in 1847, and has the Morrison-Reeves Library (public) with 27,000 volumes, and the Richmond Law Library. The Eastern Indiana Hospital for the Insane is here, also Saint Stephen's Hospital, and homes for orphans and for women. There are fine public school buildings, including a large high school, and among other public edifices of note are the city hall and the county court-house. Glen Miller Park comprises about 135 acres. The yearly meeting of the Orthodox Friends of Indiana is held in Richmond. The city is the commercial centre of a fertile agricultural section, and is important also for its manufactures, which, in the census year of 1900, represented capital to the amount of \$5,175,000, and had an output valued at \$5,282,000. The chief products include threshing machines, traction engines, grain drills, lawn mowers, carriages and wagons, steam engines and boilers, church furniture, desks, pianos, brick, paper, paper bags, flour, sawed lumber, etc. Laid out in 1810, Richmond was incorporated two years later as a town, and in 1840 received a city charter. It is situated on the old National Road. Population, in 1890, 16,608; in 1900, 18,226.

RICHMOND. A city and the county-seat of Madison County, Ky., 50 miles southeast of Frankfort, on the Louisville and Nashville and other railroads (Map: Kentucky, G 3). It is the seat of the Madison Female Institute. Farming and the breeding of horses constitute the principal industries. Population, in 1890, 5073; in 1900, 4653.

RICHMOND. A city and the county-seat of Ray County, Mo., 40 miles east by north of Kansas City, on the Atchison, Topeka and Santa Fe Railroad (Map: Missouri, B 2). It is situated in a region engaged in agriculture, cattle-raising, and coal-mining, and manufactures flour and lumber products. The Woodson Institute is here. Population, in 1890, 2895; in 1900, 3478.

RICHMOND. The largest city of Virginia and a port of entry, the State capital and county-seat of Henrico County, 116 miles south by west of Washington, D. C. (Map: Virginia, G 4). It is situated on the James River, 127 miles from the Atlantic Ocean, at the head of tidewater. The rapids here have a fall of 100 feet in 6 miles and furnish an immense water power. A canal extends around the rapids, providing means for navigation by smaller vessels for a considerable distance above the city. Several bridges span the James, connecting with Manchester and other suburbs. There are steamship lines to Atlantic coast ports, and the railroad facilities comprise the Southern Railway, the Atlantic Coast line, the Seaboard Air Line, the Chesapeake and Ohio, the Norfolk and Western, and other roads.

The site of Richmond is of great natural beauty. It is regularly laid out on a succession of low hills that rise from the northern bank of the James, the highest point reaching an altitude of 250 feet above the sea. The area is about 5½ square miles. More than three-fourths of the total street mileage (120 miles) is paved, macadam and Belgian blocks being used in the more important thoroughfares. The parks and cemeteries of Richmond and its monuments are of especial interest. The public park system, with an aggregate area of 376 acres, includes Reservoir Park of 300 acres on the western bounds of the city; Monroe, Gamble's Hill, Jefferson, Marshall, and Chimborazo parks, besides the Capitol Square. Capitol Square, on Shockoe Hill in the heart of Richmond, is 12 acres in extent. Here is situated the State Capitol (1785-96), modeled at the suggestion of Thomas Jefferson, after the Maison Carrée at Nîmes. In the Capitol are busts and portraits of many eminent men, including the celebrated marble statue of Washington by the French sculptor Houdon in the rotunda. There are also in the square the new State Library, used mainly as an office building, the Governor's mansion, and the old Bell House. On the grounds, near the Capitol, is a splendid monument to Washington. Statues of Henry Clay and 'Stonewall' Jackson by Hart and Foley, respectively, also adorn Capitol Square.

In Monroe Park are a statue of General Wickham and the site of the Jefferson Davis Monument. Gamble's Hill Park is noteworthy for the splendid view it affords. It overlooks the famous Tredegar Iron Works and the river with the historic Belle Isle and other islands. On Libby Hill (Marshall Park) stands the Con-

federate Soldiers' and Sailors' Monument. This elevation also commands a good view of the James and its islands and bridges. In Chimborazo Park (29 acres) was a well-known Confederate hospital. A fine road leads from this park to the National Cemetery, two miles to the southeast of the city. Next in importance after the Washington Monument is the equestrian statue of General Robert E. Lee in Lee Circle. The Jefferson Monument and the Howitzer Monument also are worthy of note. Hollywood Cemetery is the most interesting in Richmond. It is the burial place of many famous persons, as well as of 18,000 Confederate soldiers in honor of whom is a rough pyramidal monument of granite. Other cemeteries are Riverview, Mount Calvary, and Oakwood, the last also having several thousand Confederate Soldiers' graves. The National Cemetery contains 6553 graves, 5700 of unknown dead.

The City Hall, facing Capitol Square on the north, ranks with the Capitol among the public buildings of Richmond. It is a handsome structure of granite with a tower 180 feet high. It cost \$1,500,000. Other edifices of importance are the Chamber of Commerce, the post-office, the State penitentiary, the Soldiers' Home, and the new depot of the Chesapeake and Ohio and the Seaboard Air Line. Among historic buildings are the Old Stone House, the oldest in Richmond; Saint John's Church (1740); the 'White House of the Confederacy,' which now serves as a repository for Confederate relics; General Lee's residence, the home of the State Historical Society; the Masonic Temple, dating from 1785; and Chief Justice Marshall's house. The Valentine Museum has more than 100,000 archaeological specimens, many objects of historic interest, and an art collection. Richmond is the seat of Richmond College (Baptist), opened in 1832; Union Theological Seminary (Presbyterian), opened in 1812; the Medical College of Virginia; the University College of Medicine; and the Women's College. The institutions for colored students include the Hartshorn Memorial College, and Virginia Union University (Baptist), opened in 1899. There are also a number of private schools, and the Mechanics' Institute, which has been recently installed in a new building. The State library, with nearly 100,000 volumes, is the largest in the city. Other important collections are the Rosemary Public Library, the State Law Library, and that belonging to the Virginia Historical Society. Among the charitable institutions are the Old Dominion Hospital, Virginia Hospital, Saint Luke's Hospital, the Eye, Nose, Ear, and Throat Infirmary, Retreat for the Sick, Sheltering Arms, and the City Almshouse and Hospital.

Richmond is an important industrial and commercial centre. Its commercial interests are confined almost entirely to a wholesale and jobbing and retail trade, its foreign commerce having amounted in 1901 to only \$111,173. The jobbing trade in the same year amounted to \$41,375,000, and the retail trade at \$14,000,000. Bank clearings for 1901 aggregated nearly \$2,000,000. Plans are under way for deepening the channel of the James from Richmond to the sea, so as to provide a minimum depth of 22 feet at mean low tide. This improvement will add considerably to the commercial advantages of the city. As an industrial centre, Richmond ranks first in the

State, its tobacco and iron interests being of primary importance. It is one of the leading tobacco markets in the United States, the tobacco industry being represented by stemming and rehandling establishments, and by manufactories of chewing and smoking tobacco, snuff, cigars, and cigarettes. The iron interests include foundries and machine shops, locomotive works, car axle and railroad spike works, and nail, horse shoe, and agricultural implement works. Flour and fertilizers also are manufactured extensively. Other products are boxes, carriages and wagons, lumber (cedar), woodenware, hubs and spokes, etc.), tin roofing, tin tags, baking powder, paper, twine, meat juice, trunks and bags, hats, etc. Some shipbuilding is carried on. The various industries in the census year 1900 possessed \$20,849,000 capital, and an output valued at \$28,901,000.

The municipal government, under a charter of 1870, revised in 1891 and 1892, is vested in a mayor, elected every two years; a bicameral council; and administrative officers, most of whom are elected by the council in joint session. A number of important officials are chosen, however, by popular vote. Richmond spends annually for maintenance and operation about \$1,262,000, the chief items being: interest on debt, \$375,000; the gas works, \$137,000; schools, \$125,000; the police department, \$105,000; the fire department, \$93,000; streets, \$92,000; charitable institutions, \$43,000; municipal lighting, \$35,000; the water-works, \$34,000. The actual income for the fiscal year 1902 was more than \$1,600,000. The water-works and the gas works are the property of the municipality. The gas plant cost \$994,000 and now has 80 miles of mains. The water-works system cost \$2,323,500 and includes 103 miles of mains. There are two reservoirs with a storage capacity of 52,000,000 gallons, and a daily pumping capacity of 24,000,000 gallons. The net debt of the city in 1902 was \$6,610,582; the assessed valuation of real and personal property was \$71,117,607.

The population of Richmond in 1800 was 5737; in 1850, 27,570; in 1860, 37,910; in 1870, 51,038; in 1880, 63,600; in 1890, 81,388; in 1900, 85,050. The total population in 1900 included 2865 persons of foreign birth and 32,230 of negro descent.

In 1609 Capt. John Smith bought from the Indians a tract of land near the site of Richmond and founded a settlement which he called 'None Such.' In 1645 Fort Charles was built in the vicinity, and near here in 1676 Nathaniel Bacon (q.v.) defeated the Indians in the 'battle of Bloody Run.' By grants in 1675 and 1687, Col. William Byrd obtained possession of the land in this district, and in 1733 his son, Col. William Evelyn Byrd, laid out a town which he named Richmond. In 1742 Richmond was incorporated. In Saint John's Episcopal Church in 1775, Patrick Henry made his famous speech, closing with the words, "Give me liberty or give me death." Richmond became the capital of the State in 1779, and in 1782 it was chartered as a city. On January 5, 1781, a small English force under General Benedict Arnold entered the place and destroyed all the warehouses and public buildings. In 1788 the convention which ratified the Federal Constitution for Virginia met in Saint John's Church. The 'Virginia Resolutions' of 1798-99 were passed at Richmond, and here, in 1861, Virginia formally adopted the Act of Secession. From

May, 1861, to April, 1865, Richmond was the capital of the Confederacy, and as such was the objective point of the Federal forces, which fought fifteen pitched battles and at least twenty skirmishes in the effort to capture it. On April 2, 1865, it was evacuated by the Confederates, who, by order of General Ewell, set fire to the warehouses and destroyed the greater part of the business portion of the city. The Federal forces entered the place on the day after its evacuation. Consult: a sketch by Henry, in Powell, *Historic Towns of the Southern States* (New York, 1900); "Richmond Since the War," in *Scribner's Monthly* (ib., 1877); and Wood, *The Industries of Richmond* (Richmond, 1886).

RICHMOND, CHARLES LENNIX, third Duke of (1735-1806). An English diplomat and statesman. He was born in London, and succeeded to the peerage on the death of his father, the second Duke, in 1750. He was educated at Westminster School, later proceeding to Leyden University, where he graduated in 1753. He entered the army, saw active service in France, and was mentioned for his bravery at the battle of Minden in 1759, where he served as colonel of his regiment. He received a Court appointment, but, disagreeing with George III., resigned and joined the opposition Ministry. In 1765 he was sent to Paris as Ambassador Extraordinary, became a Privy Councillor, and the following year was appointed Secretary of State for the South. He was a strong supporter of the American colonies in their demands for redress of grievances; in 1770 he introduced conciliatory resolutions which were carried by a majority, and in 1775 during a debate on American affairs defended the attitude of the colonists, declaring that their resistance was "neither treason nor rebellion, but perfectly justifiable in every possible political and moral sense." In 1778 he moved the resolution for the withdrawal of the troops from America. In 1782 he received the appointment of master-general of ordnance with a Cabinet seat, and was created a knight of the Garter. He was reinstated in royal favor, and his later career was marked by subserviency to Court interests.

RICHMOND, DEAN (1804-66). An American capitalist, born in Bernard, Vt. He opened a produce business in Buffalo in 1842, became wealthy, and held office in several corporations. He took an active interest in railways and was influential in securing the consolidation of the several corporations that later constituted the New York Central Railroad. Of this railroad he became vice-president in 1853 and from 1864 until his death was president. In politics he was an active Democrat, and though he refused to accept any public office, he was for several years the chairman of the Democratic State Committee and the leader of his party in New York State.

RICHMOND, GEORGE (1809-96). An English portrait painter, born in Brompton. He was a pupil of the Royal Academy, and became a member of the Royal Academy in 1867. He painted portraits of many of his celebrated contemporaries, such as Dr. Keble, the Earl of Elgin, Sir Moses Montefiore, and Lord Salisbury. His early work was imitated by William Blake, whom he greatly admired. Many of his portraits are in water color and crayon, but he also painted in oil, and did some work in sculpture.

RICHMOND, LEGH (1772-1827). An English writer and evangelical divine, born in Liverpool. He graduated at Trinity College, Cambridge (1794); was ordained to the curacy of Brading and Yaverland in the Isle of Wight (1799); became chaplain to the Lock Hospital, London (1805), and the same year rector of Turvey in Bedfordshire. He was an earnest evangelical preacher. Between 1809 and 1814 he contributed to the *Christian Guardian* three famous village tales—"The Dairyman's Daughter," "The Young Cottager," and "The Negro Servant." All three were reprinted in 1814 as *The Annals of the Poor*. Before 1849 4,000,000 copies of the *Dairyman's Daughter* had been issued in nineteen languages. Richmond published also *Fathers of the English Church*, and after his death appeared *Domestic Portraiture*. Consult the *Life* by Grimshaw (London, 1828; ed. by G. T. Bedell, Philadelphia, 1846).

RICHMOND, SIR WILLIAM BLAKE (1843—). An English historical and portrait painter, born in London. He was the pupil of Sir Frederick Leighton, and his works belong to the order of classic genre made popular by Leighton and Alma-Tadema. They include "Amor Vincit Omnia," and "An Audience in Athens During the Representation of the Agamemnon" (1885, in the Birmingham Gallery). He also painted several portraits of celebrities. He was Slade professor at Oxford from 1878 until 1883, became an associate of the Royal Academy in 1888, and was knighted in 1897. He designed and superintended the mosaic decoration of the interior of Saint Paul's Cathedral, London.

RICHTER, RIK'TER, AEMILIUS LUDWIG (1808-64). A German jurist, born at Stolpen, Saxony, and educated at Leipzig. His *Corpus Juris Canonici* (1833-39) led to his being appointed professor of law in Leipzig, and he held subsequently similar positions at the universities of Marburg and Berlin. He also served as councillor-in-chief of the consistory and Privy Councillor of the Government. Richter is considered the founder of a new school of Church law—the so-called 'Berliner Kanonisten-Schule.' His publications include: *Beitrag zur Kenntnis der Quellen des canonischen Rechts* (1834); *Canones et Decreta Concilii Tridentini* (1853); and *Lehrbuch des katholischen und evangelischen Kirchenrechts* (1842-86), which is considered a most important contribution to Church law literature.

RICHTER, EUGEN (1838—). A German politician, born in Düsseldorf, and educated at Bonn, Heidelberg, and Berlin. In 1864 his election as burgomaster of Neuwied was not confirmed because of his liberal views. He resigned from his governmental post and settled in Berlin as a journalist. He was elected to the North German Diet in 1867, to the Prussian House of Deputies in 1869, and in 1871 to the Reichstag, where he was a leader of the Progressists and later of the Radicals. Intensely individualistic, he attracted attention by his opposition to State control of railroads, increase of war budgets, an Imperial colonial policy, and protectionism. Richter's opposition to Bismarck was particularly bitter. His political attitude sometimes placed him in opposition to his own party, and the *Freisinnige Zeitung*, founded by him in 1885, was on many subjects, especially on social reform, in direct contradiction to the other

papers of the party. He wrote: *Politische ABC-Buch* (1879-98); *Die Irrlehren der Sozialdemokratie* (1890); *Sozialdemokratische Zukunftsbilder* (1891; in English, 1892); *Jugend-erinnerungen* (1892); and *Im alten Reichstag, Erinnerungen* (1894).

RICHTER, GUSTAV (1823-84). A distinguished German figure and portrait painter, born in Berlin. He began his studies at the academy there under Eduard Holbein, then was a pupil of Cogniet in Paris, and studied in Rome until 1849. The brilliant technical qualities of his "Raising of Jairus's Daughter" (1856, National Gallery, Berlin), painted by commission of King Frederick William IV., aroused great enthusiasm on its exhibition, but this and a large oil painting of the "Building of the Pyramids" (1859-72, Maximilianum, Munich), ordered by the King of Bavaria, suffer from theatrical pathos, and, recognizing the limitations of his talent, Richter confined himself thereafter to the depiction of single figures, and to portraiture, in which he was eminently successful. The first of a series of portraits of aristocratic beauties was that of "Princess Carolath," which created a sensation in 1872. Of several family groups, reflecting the artist's own domestic happiness, two called "Evviva!" the painter with his first-born, and "Maternal Happiness," the painter's wife (youngest daughter of Meyerbeer) with their younger boy, were among the gems of the exhibition in 1874. From the last decade of his life date his maturest works, in which he combined a thorough characterization with the purely pictorial qualities. The splendid portrait of a "Banker's Wife" (1876) was followed by that of "Countess Károlyi" (1878), which distanced all his former efforts, but was surpassed in its turn by the well-known ideal portrait of "Queen Louise" (1879, Cologne Museum). Mention should be made also of the portraits of "Emperor William I." (1876 and 1877), "Empress Augusta" (1878), and "General Count von Blumenthal" (1883, unfinished, National Gallery, Berlin). The Metropolitan Museum, New York, contains a figure of "Victory."

RICHTER, HANS (1843-). An Austrian musical conductor, born in Raab, Hungary, where his father was kapellmeister. In 1853 he became a chorister in the Court Chapel at Vienna, and began his musical studies at the Conservatory. From the year 1866 dated his intimacy with Wagner, who in 1868 secured him the appointment of chorus-master at the Munich Opera. Two years later he conducted *Lohengrin* at Brussels, and from 1871 to 1875 served as kapellmeister at the Budapest National Theatre. He conducted the concerts of the Vienna Gesellschaft der Musikfreunde for several seasons, gave many important concerts, and in 1876, alternately with Wagner, conducted the *Nibelungen* performances at Bayreuth. In 1877 he commenced the annual Richter Concerts, in London, which were among the most important musical events of the country. He was chosen in 1877 as the chief conductor of the Bayreuth Festival. He conducted also the Lower Rhenish festivals, and most of the important English festivals.

RICHTER, JOHANN PAUL FRIEDRICH, usually called by the name he chose himself, **JEAN PAUL**

(1763-1825). The most widely known of German humanists. He was born at Wunsiedel, a village in Upper Franconia. In 1779 he began to attend the gymnasium at Hof. Soon his father died, leaving his wife and Jean Paul to be cared for by Jean Paul's grandparents at Hof. On their death the mother and son were penniless, and had to make what shift they could while Jean Paul studied at the gymnasium. In 1781 he went to Leipzig to study theology, but he soon fell under the influence of Rousseau and of English humanists and satirists. He had earlier begun to make a collection of jests and anecdotes. Finding no opening as a teacher, he turned to literature. The *Locustina Moria* of Erasmus set him to writing his *Ussher's Dummheit*, but his book found no publisher till after his death. In his anonymously published *Grönlandische Prozesse* (1783) he satirized authors, women, theologians, ancestral pride, etc., but his satire fell rather flat. Poverty soon drove him to flee from Leipzig to avoid his creditors (1784). The next three years (1784-87) he spent in reading, hack writing, and desultory rambling. Then some parents were induced to trust him with the education of their children, and for nine years he practiced his original pedagogic theories, writing the while some clever satires, *Unzahl aus des Teufels Papiere* (1789); *Fallob's Reise* (1796); the more famous idylls *Schulmeister Wut* (1793), and *Quintus Firlin* (1796); translated by Carlyle, 1827), and the novels, *Die unsichtbare Loge* (1793), and *Hesperus* (1794, trans. 1865). *Hesperus* attracted the attention of Charlotte von Kalb, who, in 1796, invited Richter to Weimar, where Goethe received him with cool politeness, as did Schiller at neighboring Jena, his influence being contrary to their own aspirations for a classical German literature. Herder's welcome was warm, and Charlotte von Kalb tendered her heart with her hand, Weimar society being in those days still imperfectly monogamous.

In the first flush of his good fortune Richter wrote *Blumen-, Frucht- und Dornenstücke, oder Ehestand, Tod und Hochzeit des Armenadvokaten Siebenkas* (1796-97, trans. 1844, 1871, 1877); and *Das Kampanerthal* (1797), wearisome reflections on immortality. He fascinated the Weimar ladies with his conversation, and more still by his sympathetic listening smile. He returned to Hof in 1797, only to take wing for a longer flight to Weimar, Leipzig, and Berlin, where he married Caroline Mayer (1801). After three years of wedded wandering he settled in Bayreuth. Here he passed the rest of his life, twenty-one years, in harmless eccentricity. The rather tittle novel *Titon* (1801-03) had already appeared. The first fruit of Bayreuth was the uneven and unfinished *Fliegjahre* (1804-05), showing the influence of Goethe's *Wilhelm Meister*, with passages of charming description, humorous satire, and delicate fancy that suggest Laurence Sterne. This is Richter's last work of pure imagination that one is not glad to forgive and forget. But in his last years he made valuable contributions to pedagogy in *Levana* (1807), to art in his *Vorschule der Aesthetik* (1804), and to politics in his *Demonstrationen für Deutschland* (1809), and *Lebenspredigten* (1810-12), continued with redoubled scorn in 1817. *Levana*, though disconnected and unfinished, was full of fruitful suggestion especially in its portions dealing with the education of women. Goethe praised it warmly for "the

lowest virtues, without the least excess." The *Ästhetik* is valuable chiefly for its keen analysis of humor and happy praise of wit. It closes with a glowing eulogy of Herder and is a fragmentary development of his theory. The political papers, the most virile and practical of Richter's works, were bold denunciations of Napoleon and the German sycophants, whereas those of 1817 held up to even more merited shame the German princes who mocked the promises by which they had regained power. Disease troubled the peace of Richter's last years. He traveled much, and might to advantage have written less. He died in Bayreuth November 14, 1825. An *Autobiography* appeared in 1826. Though for a time widely popular, and still highly prized by a few, Richter was without lasting influence on the currents of German literature.

Richter's *Works* are edited in 34 vols. (Berlin, 1860-62), and in 60 parts (ib., 1879 et seq.). There is a continuation to the *Autobiography* by Otto and Förster (Breslau, 1827-33); a *Biographischer Kommentar* by Spazier (Leipzig, 1833). Consult also: Förster, *Denkwürdigkeiten* (Munich, 1863), and the *Correspondence* of Richter with Otto (Berlin, 1829-33), Charlotte von Kalb (ib., 1882), Jacobi (ib., 1828), and Voss (Heidelberg, 1833); Vischer, *Kritische Gänge*, vol. i. (Stuttgart, 1873); Nerrlich, *Jean Paul, sein Leben und seine Werke* (Berlin, 1890); Carlyle's *Miscellaneous Essays*, vols. i. and iii. (Boston, 1839); De Quincey's *Life of Richter* (London, 1845); J. Müller, *Jean Paul und seine Bedeutung für die Gegenwart* (Munich, 1894); id., *Die Sechsbüchre Jean Pauls* (ib., 1894); id., *Jean Paul Studien* (ib., 1899); and the selections from his writings by Lady Chatterton (London, 1859).

RICHTER, Ludwig (1803-84). A German landscape painter, etcher, and draughtsman, and one of the greatest illustrators of all times. He was born in Dresden, the son of the engraver Karl August Richter (1778-1848), who first instructed him. After his return from a sojourn in Rome (1823-26), he was appointed instructor in the school of drawing at the porcelain factory in Meissen and in 1836 at the Dresden Academy, where he continued as professor from 1841 to 1877. The interest of his uneventful life centres within the circle of his art. As a painter Richter aimed at a thorough blending of the figure element with the landscape and may be judged by the following examples: "Valley of Amalfi" (1824), "Bay of Salerno" (1826), "Harvest Procession in the Campagna" (1833), a composition in the vein of Claude Lorrain, "Evening Landscape with Worshipers" (1842), all in the Leipzig Museum; "Ferry at the Schreckenstein" (1836), "Bridal Procession in Springtime" (1847), both in Dresden Gallery; and "View in the Riesengebirge" (1839), in the National Gallery, Berlin. Among his 240 etchings are about 140 views in Saxony, others of Salzburg, Rome, and the Campagna. His individuality as a great artist is revealed, however, neither through his brush nor his burin, but in his 3000 or more drawings for the woodcut, of which he is to be counted, with Adolf Menzel, one of the most influential revivers. His first contribution in that line, of 25 drawings, to *Das malerische und romantische Deutschland* was followed by the illustrations to Marbach's *Deutsche Volksbücher*

(1838), to Duller's *Geschichte des deutschen Volkes* (1840), to *The Vicar of Wakefield* (1841), to Musäus's *Volksmärchen* (1842), and to numerous other fairy tales, to the *Goethe Album* (1855), to Schiller's *Glocke* (1857), and by those cyclical publications which reveal the most brilliant side of the artist's inexhaustible fancy, such as "Beschauliches und Erbauliches" (1851); "Kinderleben" (1852); "Fürs Haus" (1858-61); "Der gute Hirt" (1860); "Unser täglich Brot" (1866); and "Bilder und Vignetten" (1874). An eye disease put a stop to the practice of his art in 1874, and after retiring from his professorship in 1877 he was pensioned. He died at Loschwitz, near Dresden. Consult his *autobiography*, *Lebenserinnerungen eines deutschen Malers*, edited by his son Heinrich (10th ed., Frankfurt, 1900); the monographs by Hoff (Dresden, 1877), Erler (Leipzig, 1897), and Mohn (Bielefeld, 1898); also Pecht, *Deutsche Künstler*, i. (Nördlingen, 1877); Springer, in *Zeitschrift für bildende Kunst* (Leipzig, 1883); Atkinson, in *Art Journal* (London, 1885); and Lützwow, *Die vielfältigste Kunst der Gegenwart* (Vienna, 1886).

RICHTHOFEN, rīkt'hō'fən, FERDINAND, Baron (1833—). An eminent German traveler, geologist, and geographer, born at Karlsruhe, in Silesia. He studied in Breslau and Berlin, traveled in Eastern Asia and Oceania (1860-68), and after a short stay in California explored Japan and China. In 1875 he was named professor of geology at Bonn, and after three years in a chair of geography at Leipzig, in 1886 became a professor in the University of Berlin. In 1902 he became director of the newly founded Institut für Meereskunde. His chief works include: *Geognostische Beschreibung von Preduzzo* (1860); *The Natural System of Volcanic Rocks* (1867); *Letters on China* (1870-72); *China* (1877-83); *Atlas von China* (1885); *Methoden der heutigen Geographie* (1886); and *Sehantung und seine Einigungspunkte Kiautschou* (1898). In English he published: *The Comstock Lode* (1865); *Principles of the Natural System of Volcanic Rocks* (1867); and *Letters to the Shanghai Chamber of Commerce* (1869-72).

RICIMER, rī-sī-mēr (?-472). A Roman general of the Western Empire. His father was a Suevian chief, and his mother a daughter of Wallia, King of the Visigoths. He was brought up at the Roman Court, rose rapidly in the army, and defeated the Vandals in a naval battle near Corsica, and in a land fight near Agrigentum (456). Immediately after this he attacked Avitus, who had been proclaimed Emperor of the West, defeated him at Placentia, and put Majorianus in his place. In 461 he deposed Majorianus and crowned Libius Severus, and, after managing the Empire himself during an interregnum of a year and a half, brought Anthemius to the throne (467). In 472 he quarreled with Anthemius, and, deposing him, made Olybrius King, but died himself a little more than a month after, having been the real power in Italy for sixteen years.

RICINUS. See CASTOR OIL.

RICKAREES, or **ARICARAS**, á-rō'ká-ráz. A tribe of Pawnee Indians. See ARIKARA.

RICKETS, or **RACHITIS** (from *wrick*, MDutch *wrieken*, Dut. *LGer. wrieken*, to move

to and fro). A disease of nutrition, the chief feature of which is an alteration in the growth of the bones by which they become enlarged at their extremities and so soft that they are bent and distorted by muscular action and the weight of the body. It is essentially a disease of children, occurring as a rule between the ages of one and two years. The causes are improper and insufficient food, and bad hygienic surroundings. The faults of diet from which infants are likely to develop rickets are: (1) deficient quality of milk from ill health, and malnutrition of the nursing mother or unduly prolonged lactation; (2) the substitution for the mother's milk of artificial foods which contain a high percentage of starch and too little fatty and proteid matter.

The symptoms develop gradually and almost imperceptibly. The child is restless at night and during sleep perspires profusely about the head and neck. It is very sensitive to pressure upon the limbs, often screaming when merely touched. The muscles are soft and flabby and gastric indigestion and intestinal disturbances set in, accompanied by swelling of the abdomen and colic. Characteristic and remarkable changes in the bones develop. The joints become thickened, and nodules form at the junction of the ribs with the costal cartilages, constituting what is called the 'rosary' or 'beading of the ribs.' Defective ossification is also seen in the skull, where the fontanelles are large and slow in closing. The teeth do not appear until the eleventh or twelfth month, instead of the sixth or seventh, and present many irregularities in the order of their eruption. As the disease progresses the bones grow softer and various deformities of the head, spine, limbs, chest, and pelvis are brought about by muscular contraction and the superincumbent weight of the body. The child becomes 'pigeon-breasted' and bow-legged. (See LEG.) The nervous system may be seriously affected, and rickety children are peculiarly liable to convulsions, and a spasmodic affection of the larynx known as *laryngismus stridulus*.

Rickets is a recoverable disease in the sense that it does not directly cause death and the process of bone-softening ceases after a time, although it may have produced permanent deformity. Rickety children are especially prone to severe bronchitic attacks by which death is often brought about. The treatment is essentially hygienic and dietetic. The child should be suitably clothed, and receive an abundant supply of fresh air and proper food. Starchy materials, for the digestion of which the infant's secretions are not yet prepared, should be excluded from the diet, and cow's milk, to which lime water and a little cream may be added, should constitute the sole food. As the infant approaches the second year, beef juice, chicken broth, or gravy may be added to the dietary, and at a later age a little meat, eggs, and custard may be given. The most valuable medicine is cod-liver oil, given two or three times a day after a meal, in doses proportioned to the child's age. Phosphorus, syrup of the iodide of iron, and preparations of lime such as the lacto-phosphate are also of value in certain cases. While the bones are soft walking should be discouraged. Deformities of the limbs remaining after the disease is cured may, if extreme, be remedied by surgical procedures.

RICK'ETTS, JAMES BROWLTON (1817-87). An American soldier, born in New York City. He graduated at West Point in 1839, and after receiving his commission as lieutenant of artillery served in the Mexican War. At the outbreak of the Civil War he participated in the defense of Washington and at Bull Run (July 21, 1861) was wounded and taken prisoner. On his release eight months later, he returned to duty with the grade of brigadier-general and took part in the second battle of Bull Run. Later he led a division in the Virginia and Maryland campaigns, and at Antietam lost a third of his troops. He participated in the Virginia campaign in the spring of 1864, but in July was ordered north to join in the defense of Washington, which was then threatened by General Early, and participated, under Sheridan, in the pursuit of Early through the Shenandoah Valley. At Cedar Creek (October 19, 1864), where he commanded a corps, he received a wound which disabled him for the winter. He was brevetted major-general in the Regular Army March 13, 1865, and from July, 1865, until April, 1866, when he was mustered out of the volunteer service, he commanded a district in Virginia. In January, 1867, he was retired from the regular service with the rank of major-general.

RICK'MAN, THOMAS (1776?). An English architect and writer on architecture. He was professor of architecture in the Liverpool Academy, and is chiefly known from the fact that in his work, *Attempt to Discriminate the Styles of Architecture in England from the Conquest to the Reformation* (1817), he first gave to the periods of English mediæval architecture the names Norman, Early English, Decorated, and Perpendicular, which have been used ever since.

RICO, rō'kō, MARTIN (c.1850—). A Spanish landscape and marine painter, born in Madrid. He was a pupil of Federico de Madrazo in Madrid, where he obtained a scholarship which enabled him to study in Paris and Rome. There are two representative works by him in the Metropolitan Museum, New York City, "The Grand Canal, Venice," and an "Italian Garden." He painted in the manner of Fortuny. His pictures have fine architectural backgrounds, and his color is brilliant and pleasing. He received a second-class medal at the Paris Exposition of 1889, and the Legion of Honor in 1878.

RICOCHET, rik'ō-shā' (of uncertain etymology). In military fire tactics, this term describes a method of gun fire, in which the gun is fired at a low angle, and the missile rebounds from the flat surface over which it is traveling. In shelter trenches, rifle pits, redoubts, and other field fortifications rocks and stones are very carefully covered with earth to avoid the possibility of deflecting the enemy's fire. It has been found that many of the more serious rifle shot wounds inflicted on both sides during the British Boer War of 1899-1902 were the result of accidental ricochet fire, and not of explosive or dum-dum bullets, as at first charged. When spherical projectiles were used in naval guns they were allowed to strike short and ricochet rather than run any risk of going over the enemy, for spherical projectiles are not deflected laterally by striking the surface of water at a low angle, nor do they tend to rise after ricochet. Rilled projectiles are sharply de-

flected upon striking water and they frequently rise from the water surface at an angle very much greater than the striking angle; consequently ricochet is avoided in modern gun fire. See GUNNERY.

RICORD, *ri-kôr'*, or **RICARD**, JOHN. An American lawyer, said to have been a native of New York State, who went to Hawaii in October, 1843, and the next year was appointed Attorney-General of the island kingdom. In 1845 the Hawaiian Legislature authorized him to draft a series of acts organizing the five executive departments of the Government: Interior, Foreign Affairs, Finance, Public Instruction, and Attorney-General. It also adopted changes in the Constitution of 1840 affecting the Privy Council and the judiciary, which he proposed. In 1846 and 1847 it accepted the statute laws that he drew up, and these continued until the revolution to be the basis of Hawaii's civil code. His services in shaping Hawaiian institutions during their formative period were very valuable. He left the islands in 1847.

RICORD, PHILIPPE (1800-89). A French surgeon, born at Baltimore. He went in 1820 to Paris, where he was attached in succession to the Hôpital-Dieu under Dupuytren, and to the Pitié under Lisfranc. He graduated in medicine in 1826, and after practicing in the provinces, in 1828 he returned to Paris, where he delivered two annual courses of lectures at the Pitié on surgical operations, and was appointed surgeon-in-chief to the hospital for venereal diseases. This post he held with brilliant success till his retirement in October, 1860. He won a world-wide reputation in his specialty. In 1831 he became surgeon-in-chief of the Hôpital du Midi in Paris. For his suggestions on the cure of varicocele and on the operation of urethro-plasty he received in 1842 one of the Montyon prizes. In 1862 he was appointed physician in ordinary to Napoleon III., and in 1869 consulting surgeon to the Emperor, having already on August 12, 1860, been raised to the distinction of commander of the Legion of Honor. In 1871 he was made, for his services in the ambulance corps during the siege of Paris, grand officer of the Legion of Honor. His works are numerous, the more important of them being: *De l'emploi du spéculum* (1833); *Traité des maladies vénériennes* (1838); *Lettres sur la syphilis* (1851).

RIDDLE (AS. *radels*, *radelse*, from *radan*, to council, interpret, read, Goth. *ga-rêdan*, OHG. *râtan*, Ger. *raten*, to council; perhaps connected with Lat. *rerî*, to think, or with OChurch Slav. *raditi*, to be anxious, Skt. *râdh*, to be successful). The definition in obscure terms of a well-known object, which the person addressed is required to name. In modern times the enigma usually makes a witticism or pun; but anciently it had a character more serious. The themes of riddles were often natural objects, like the sun, moon, wind, or rainbow, and the presentation had something of a mythologic character. Knowledge of this sort was considered to imply a measure of wisdom which was in accordance with the early inclination to express truth in a mystical manner, rather than in straightforward and simple speech. Thus Samson, in order to show his intelligence, propounded a riddle to the Philistines. Riddle guessing was often made to form a game, in which one side asked questions, and the other

side responded; and such contest might be the subject of wagers. According to mythology the stake was often life or honor. Such was the case in the riddle proposed by the Sphinx to Oedipus: "What is that which has four feet in the morning, two at noon, and three at night?" to which the answer was: "Man." So Old Norse poetry makes Odin enter into a riddling contest with the giant Vafthrudnir, in which the latter perishes. In the Alvis-mál, the prize of the contest is the daughter of the god Thor. Of these contests we have a survival in the English ballad of the Elfin-knight, where a maid saves herself from an evil spirit by guessing his riddles. So in modern nursery lore, a nurse will put to a child riddles to be guessed on penalty of a forfeit.

RID'DLE, ALBERT GALLATIN (1816-1902). An American lawyer and author, born in Monson, Mass. He was admitted to the bar in 1840, and in 1848-49 served in the State Legislature. In 1859 he defended the Oberlin slave-rescuers, and in 1861-63 was in Congress as a Republican. He was engaged by the State Department to assist in prosecuting John H. Surratt for his part in the assassination of President Lincoln. In 1877 he was appointed law-officer of the District of Columbia, and subsequently practiced at Washington. For a time he was head of the law department at Howard University. He wrote several stories of early Ohio life, such as *Bart Ridgely* (1873) and *The Sugar-Makers of the West Woods* (1885); a *Life of Benjamin F. Wade*; and *Recollections of War Times, 1860-65*.

RIDDLE, JOSEPH ESMOND (1804-59). An English divine and lexicographer. He was born at Bristol, educated at Saint Edmund Hall, Oxford, where he graduated in 1828, after which he resided at Ramsgate. Here he taught private pupils, prepared for his master's degree, and began the first of his important works in lexicography. After his ordination in 1830 he held many curacies, his last incumbency being Saint Peter and Saint James's, Leekhampton, Gloucester, which he held from 1840 until his death. He was select preacher at Oxford in 1834 and in 1854; and in 1852 he delivered the Bampton lectures, his theme being, *Natural History of Infidelity and Superstition in Contrast with Christian Faith*. He translated Scheller's *Lexicon Totius Latinitatis* (1835), published a *Complete English-Latin Dictionary* (1838), and a *Copious and Critical Latin-English Lexicon, founded on the Dictionaries of Dr. W. Freund* (1849). He was the author of a *History of the Papacy to the Period of the Reformation* (1854).

RIDDLE, MATTHEW BROWN (1836-). An American clergyman, educator, and author, born in Pittsburg, Pa. After his graduation at Jefferson College, Pa., in 1852, he studied theology at the New Brunswick Seminary and elsewhere until 1859, and then went to Heidelberg. He was adjunct professor of Greek in Jefferson College in 1857-58, had pastoral charges successively in two Dutch Reformed churches of New Jersey in 1861-69, and afterwards was appointed professor in the Hartford Theological Seminary, which he left in 1887 to take the chair of New Testament exegesis in the Western Theological Seminary, Allegheny, Pa. He was a member of the American committee for New Testament revision, was also a reviser of the Westminster Confession of Faith, and from 1877 to 1881 prepared *Notes on*

the International Sunday-School Lessons (1877-81).

RIDEAU, ré'dô'. A waterway formed by the lake, river, and canal of the same name in the Province of Ontario, Canada (Map: Ontario, H 2). The lake is situated from 42 to 60 miles south-southwest of Ottawa, and is drained by the Rideau River, which falls into the Ottawa River at the city of Ottawa. The canal, built between 1826 and 1834 for military purposes, connects Ottawa with Kingston on Lake Ontario by way of the river and lake and by connections with Mud Lake and the Cataraqui River. It is 126¼ miles long, has a navigable depth of 4½ feet, and 47 locks. Its importance has declined since the advent of railways.

RIDEING, rid'ing, WILLIAM HENRY (1853-). An American journalist and writer of books for young people, born in Liverpool, England. After coming to the United States he wrote for various newspapers until 1881, when he became a member of the editorial staff of the *Youth's Companion*. From 1887 to 1889 he was joint editor of the *North American Review*. His publications include: *A Saddle in the Wild West* (1879); *Stray Moments with Thackeray* (1880); *Boys in the Mountains* (1882); *Boys Coastwise* (1884); *Thackeray's London* (1885); and *The Boyhood of Living Authors* (1887).

RIDER. An American political term denoting a legislative measure which, if left to stand alone, is likely to be rejected by one branch of the Legislature or vetoed by the President, but in order to be carried through is attached to an appropriation or other bill whose enactment is assured. The practice is an encroachment upon the independence of the executive, especially in the case of the President, who is not allowed to veto parts of an appropriation bill. In many of the States efforts have been made to abolish the practice by providing that no bill shall contain matter relating to more than one subject, which shall be indicated clearly in the title, and by providing further that the Governor may veto parts of an appropriation bill. A rule of the United States House of Representatives in 1888-89 prohibited the tacking of riders to appropriation bills.

RIDGAWAY, rij'a-wá, HENRY BASCOM (1830-95). An American Methodist Episcopal minister and educator, born in Talbot County, Md., and educated at Dickinson College. After holding various pastorates he was appointed in 1882 professor in the Garrett Biblical Institute (Evanston, Ill.), of which he became president two years afterwards. He published biographies of *Alfred Cookman* (1871), *Bishop Edward S. Jones* (1882), *Bishop Beverly Waugh* (1883), and *Bishop Matthew Simpson* (1885).

RIDGE, MAJOR (c.1770-1839). A noted Cherokee chief, born at Hiwassee town, near the present Columbus, in East Tennessee. Having been formally initiated as a warrior at the age of twelve, he took an active part in the border warfare along the Tennessee frontier. Shortly after 1794 he was elected to a seat in the tribal council. He opposed cessions of tribal territory in 1804 and 1805, and took a firm stand against the doctrines of the Shawano prophet, who preached resistance to the Government. In the Creek War of 1813-14 he led a detachment of

Cherokee volunteers to the aid of General Jackson, and rendered effective service, whence he was called Major. Together with 19 others, he signed the Treaty of New Echota, in 1835, which bound the entire Cherokee nation to remove beyond the Mississippi. The treaty was opposed by John Ross, and by the entire Cherokee council, but notwithstanding repeated protest it was carried through, and the entire tribe was deported to the Indian Territory, losing nearly 1000 by death in the journey, which occupied all of the winter of 1838-39. On June 22, 1839, a few months after their arrival, Major Ridge, his son John, and Elias Boudinot, three principal signers of the treaty, were killed at their homes by men sent for the purpose, in accordance with an old Cherokee law which fixed the death penalty for attempting to sell tribal lands without the consent of the entire nation.

RIDGE, WILLIAM PETER (c.1860--). An English novelist, born at Chartham, near Canterbury. He was educated in the Birkbeck Institute, lived in the country until 1880, and wrote nothing before 1890. Both in manner and in matter he follows Dickens, and is especially happy in portraying cockney humor. His books include: *A Clergy Wife* (1895); *Secretary to Bayne, M. P.* (1897); *Mord Emily* (1898); *A Son of the State* (1899); *A Breaker of the Laws* (1900); *Outside the Radius* (1900); and *Lost Property* (1902).

RIDGWAY. A borough and the county-seat of Elk County, Pa., 119 miles east by south of Erie; on the Clarion River, and on the Pennsylvania and the Buffalo, Rochester and Pittsburg railroads (Map: Pennsylvania, U 2). The courthouse, representing an expenditure of \$60,000, is a noteworthy feature of the borough. There is a public library. Ridgway is the centre of a lumbering and farming district, and is interested chiefly in manufacturing flour, leather, iron, clay, and lumber products, railroad snow plows, and machine tools. Population, in 1890, 1903; in 1900, 3515.

RIDGWAY, ROBERT (1850-). An American ornithologist, born in Mount Carmel, Ill. Through his early interest in birds he became, while a boy of fourteen, a correspondent of Spencer F. Baird, who recommended his appointment as zoölogist on the Clarence King geological exploration of the fortieth parallel (1867-69). In the report of the expedition published by the Government in 1877, Ridgway wrote the section on ornithology, and he had made collections not only of bird skins, nests, and eggs, but of reptiles and fishes observed between Sacramento Cal., and Salt Lake City, Utah. In 1880 he was appointed curator of the Division of Birds in the United States National Museum at Washington, and he became one of the founders, and afterwards president of the American Ornithologists' Union. He collaborated with Baird and Brewer by writing the technical parts in *A History of North American Birds* (3 vols., 1874) and in *The Water Birds of North America* (1884), and he classified the birds brought from Alaska by the Fish Commission in 1889. His other publications include: *A Nomenclature of Colors for Naturalists* (1886); *Manual of North American Birds* (1887); and *The Birds of North and Middle America*, in eight volumes, which began to appear in 1901. This work is

scientifically the most important publication ever prepared for the region named, and one of the most valuable works on ornithology in existence.

RIDING. See HORSEMANSHIP.

RIDING (from Icel. *Þriðjungur*, third part, from *Þriði*, third, from *Þrur*, three; the loss of the initial *th* is due to the faulty division of *North-riding*, *South-riding* as *North-riding*, *South-riding*), or **TRIMMING**. A term applied to the three parts into which Yorkshire, England, is divided, termed respectively East, West, and North Riding. Other counties besides York had and still have subdivisions other than the common hundred. In Kent the hundreds are grouped together in Lathes or Lests; and in Sussex in Rapes. Lincolnshire, like Yorkshire, was formerly divided into Ridings. Consult Stubbs, *Constitutional History of England*, vol. i. (6th ed., Oxford, 1897).

RIDINGER, ré'ding-ér, JOHANN ELIAS (1698-1767). A famous German animal draughtsman, etcher, and painter. He was born at Ulm, was first instructed there by Christoph Resch, then studied under Johann Falk, and then under Rugendas in Augsburg. His hunting scenes were in great demand and in the representation of the stag no other artist could compete with him. A fine specimen of a "Stag Pursued by Dogs" is in the Cassel Gallery; the Grosvenor Gallery, London, has "Three Stags"; the Schwerin Gallery, "Bears in a Wilderness" (1710); but his oil paintings are very rare and he is best known through his drawings and etchings, a complete list and description of which may be found in the artist's *Life*, by Thienemann (with three supplements, Leipzig, 1856-76). His engraving of the "Lion Hunt," after Rubens, is in the Dresden Museum. His sons MARTIN ELIAS (1730-80) and JOHANN JAKOB (1735-84) engraved after his designs.

RID'LEY, NICHOLAS (c.1500-55). Bishop of London and one of the leading English reformers. He was educated at Pembroke Hall, Cambridge, at the Sorbonne, Paris, and at Louvain. He came under the notice of Archbishop Crammer, and received various appointments from him. After 1536, the year of the death of his uncle Robert, who had paid the expenses of his education and who was an orthodox Roman Catholic, Ridley openly espoused the reformed faith. By the end of the reign of Henry VIII, he had renounced his belief in the doctrine of transubstantiation, and he influenced Crammer in the same direction. During the reign of Edward VI, Ridley became very prominent. He was named Bishop of Rochester in 1547. He took part in the depositions of Bishops Bonner and Gardiner, and himself became in 1550 Bonner's successor as Bishop of London. He also took part in the first revision of the prayer-book in 1548, and assisted in drawing up the 41 articles, afterwards reduced to 39. On the death of Edward VI, he warmly espoused the cause of Lady Jane Grey (q.v.), but when this proved a speedy failure he was compelled to submit to Queen Mary. Ridley was at once committed to the Tower, and though every opportunity was given him to recant, he refused. In 1554 he was removed to Oxford for trial, found guilty in 1555 of the capital offense of heresy, and on October 16, 1555, he was burnt at the stake, together with Latimer, in front of Balliol College. Ridley's *Works*, which are chiefly polemical, have been published together with

a *Life*, by Christmas, for the Packer Society (London, 1841).

RID'PATH, JOHN CLARK (1840-1900). An American historian and educator, born in Putnam County, Ind. He graduated at Asbury (now DePauw) University in 1859, taught at Throntown Academy, Ind., and at Baker University, Baldwin City, Kan., and was elected in 1869 professor of English literature, in 1871 of belles-lettres and history, in Asbury University, of which he became vice-president ten years later. He resigned in 1885. His writings, chiefly popularizations of historical matter, are his *Academic History of the United States* (1874-75); *Popular History of the United States* (1877); *Grammar School History* (1876); *Inductive Grammar of the English Language* (1878-79); *Monograph on Alexander Hamilton* (1880); *Life and Work of Garfield* (1881-82); *Life of James G. Blaine* (1884); *History of Texas* (1884); *Cyclopedia of Universal History* (1880-85); *The Great Races of Mankind* (1892); *Christopher Columbus* (1890); a poem, *The Epic of Life* (1894); and one or two other volumes. He also compiled a *Library of Universal History*, and helped to edit the *People's Cyclopaedia*. His last and probably most widely circulated work, a *History of the United States* (in 8 vols.), was completed shortly before his death.

RIEBECKITE, ré'bek-ít (named in honor of Emil Riebeck, a German traveler of the nineteenth century). One of the numerous varieties of amphibole. It is a sodium-iron silicate crystallizing in the monoclinic system, has a vitreous lustre, and is black in color. It occurs among the older rocks, such as granite and syenite, especially on the island of Socotra, in the Indian Ocean.

RIEDEL, ré'del, KARL (1827-88). A German musician. He was born at Kronenberg, near Eilberfeld, studied at Krefeld with Karl Wilhelm, and entered the conservatory at Leipzig, in which he became a teacher of piano and theory. In 1854 he established a society for the performance of ancient church music which became famous as the Riedel-Verein under his leadership and that of Kretschmar. Upon the death of Brendel, Riedel became president of the Allgemeiner deutscher Musikverein. His compositions, mostly chorales for male voices, are vigorous and original; but his real claim to fame rests on his gift of organization, his thoroughness, and especially his masterly editing of such old works as that of Prätorius, which he practically discovered.

RIEDELSEL, ré'de-zél, FRIEDRICH ADOLPH, Baron (1738-1800). A German soldier in America, born at Lauterbach, Hesse. He studied at Marburg, served under Prince Ferdinand of Brunswick during the Seven Years' War, and in 1776 took command of 4000 Brunswick troops hired by Great Britain for service against the American colonies. He landed at Quebec in June, joined Burgoyne's expedition, fought bravely at the first battle of Saratoga (September 19, 1777), and surrendered with his commander (October 17th). He remained a prisoner for over two years together with his wife. He was exchanged in 1780, put in command of the British forces on Long Island, and returned to Germany in 1783. He was made a lieutenant-general in 1787, and commanded the Brunswickers in Holland. He died at Brunswick. His wife,

FRIEDRIKE CHARLOTTE LUISE (1746-1808), came with her husband to America and left an interesting account of their American adventures. The *Memoirs, Letters, and Journals of Major-General Riedesel During His Residence in America* (Albany, 1868) and *Letters and Journals* by Lady Riedesel (ib., 1867), both translated and edited by Stone, are among the most valuable material for the history of Burgoyne's campaign.

RIEFSTAHL, rēf'stāl, WILHELM (1827-88). A German landscape, genre, and architectural painter, born at Neustrelitz, Mecklenburg. He was a pupil of Wilhelm Schirmer at the Berlin Academy, subsequently studied nature, traveling extensively, and visited Rome in 1869-70, 1874, and 1877. In 1870-73 he was professor at the School of Art in Karlsruhe and in 1875-77 its director, after which he settled in Munich. He at first painted landscape pure and simple, as finely exemplified by "Northern Heath" (1850), "Village Graveyard" (1854), and others, and afterwards supplied his scenery with figures, to which he gradually gave greater prominence, excelling in harmonious combinations of both. Admirable specimens of this kind are: "Devotions of Passeur Shepherds in the Fields" (1864, gold medal, Berlin), "All Souls' Day at Bregenz" (1869), "Missionaries in the Rhetian Alps" (1884), all in the National Gallery, Berlin; "Wedding Procession in Bavarian Alps" (1866), in Metropolitan Museum, New York; "Blessing of the Alps" (1881), Leipzig Museum. Reminiscent of Italy are "Funeral Procession in Front of the Pantheon" (1871), Dresden Museum; "Procession Through the Forum Romanum" (1879 and "The Anatomical Theatre at Bologna" (1880), Leipzig Museum; replica (1883), Dresden Museum. Consult: Berlepsch, in *Zeitschrift für bildende Kunst* (Leipzig, 1890); Holland, in *Allgemeine deutsche Biographie*, xxviii. (Leipzig, 1889); and Rosenberg, *Die Berliner Malerschule* (Berlin, 1879).

RIEGEL, rē'gel, HERMAN (1834-1900). A German art-historian, born at Potsdam. He gave up the study of law for that of art, was director of the museum and docent at the university in Leipzig in 1868-71, then became director of the museum and professor at the Polytechnicum in Brunswick. His highly valued writings comprise: *Cornelius, der Meister der deutschen Malerei* (1866); *Deutsche Kunststudien* (1868); *Italienische Blätter* (1871); *Geschichte des Wiederauflebens der deutschen Kunst*, etc. (1874-75); *Kunstgeschichtliche Vorträge und Aufsätze* (1877); *Beiträge zur niederländischen Kunstgeschichte* (1882); *Geschichte der Wandmalerei in Belgien seit 1856* (1882); *Die bildenden Künste* (1896); *Beiträge zur Kunstgeschichte Italiens* (1898).

RIEGER, rē'gēr, FRANZ LADISLAUS (1818-1903). A Bohemian statesman, born at Semil and educated for the bar at Prague. He entered the Government service, but his career was cut short, as he was prosecuted for his political ideas. The lawsuit increased his popularity, and in 1848 seven districts elected him Deputy. He became one of the leaders of the Slavic Party in the Austrian Reichsrat. During the reactionary period which followed the revolution he took no further part of importance in politics until 1860. In the mean-

time he occupied himself with the pen as a political weapon, writing *Shaves d'Autriche* (1860) and with Kober founding the Bohemian encyclopedia, *Šlovník naučný* (1859-74). In 1861, with his father-in-law, the historian Palacky, he became a leader of the Czech National Party, both as a member of the Bohemian Diet and as a Deputy to the Vienna Reichsrat. In 1863 he dictated the "policy of abstention," by which the Reichsrat was left without a Czech representation, and he thenceforth led, with the aid of the Ultramontanes and Feudalists, the agitation for Bohemian autonomy. During the Taaffe régime, after the Czechs had reentered the Reichsrat, Rieger supported the Government, and became the head of the Old Czechs. His conservatism alienated the more radical wing of the national party (Young Czechs), who gradually gained supremacy, both in the Bohemian Diet and the Austrian Reichsrat. Toward the end of his life Rieger's influence on national affairs largely waned. In 1897 he was made a baron and called into the Austrian House of Peers.

RIEGO Y NUÑEZ, rē-ā'gō ē nūñ'nyāth, RAFAEL DEL (1785-1823). A Spanish revolutionist, born at Oviedo, in Asturias. He joined in the patriot movement against France which followed the usurpation of the Spanish throne by Joseph Bonaparte. Captured by the French, he was a prisoner until 1814, when he visited Germany and England. He was leader of the military insurrection which broke out in January, 1820, and which brought about the restoration of the Spanish Constitution of 1812. He became field-marshal and Captain-General of Aragon, and in 1822 was president of the Cortes. He ardently opposed French intervention in 1823, met the soldiers of the Holy Alliance at the head of the Army of Malaga, was wounded, taken prisoner, and handed over to the royal authorities. He was tried as a traitor, and put to death at Madrid, November 7, 1823. A hymn which he wrote, called after him the "Hymn of Riego," became a popular revolutionary song, and is now the national anthem. Consult: Riego, *Memoirs of Riego and His Family* (London, 1824); Nard and Piral, *Vida militar e politica de Riego* (Madrid, 1844).

RIEHL, rēl, ALOIS (1844-). A German philosopher, born at Bozen, Tyrol. He studied at Vienna, Innsbruck, and Munich, and was appointed professor of philosophy at Gratz in 1873. Afterwards he held similar chairs at Freiburg, Keil, and Halle. Like Laas and Avenarius, he belongs to the German group of positivists. Riehl is well known as a logician, as a critic of modern English logic, and as author of *Beiträge zur Logik* (1892). His philosophical criticism is to be found in *Der philosophische Kriticismus* (1876-87); *Moral und Dogma* (1874); *Ueber wissenschaftliche und nichtwissenschaftliche Philosophie* (1883); *Bruno* (1889; 2d ed., 1900); *Fr. Nietzsche* (1897; 3d ed., 1901); and *Zur Einführung in die Philosophie der Gegenwart* (1903).

RIEHL, WILHELM HEINRICH (1823-97). A German historian of civilization and novelist, born at Diebrich, and educated at Marburg, Tübingen, Bonn, and Gießen. In 1846 he entered journalism on the staff of the *Karlsruher Zeitung*; then founded the *Badischer Landtagshof*; and after his election to the German

National Assembly in 1848, edited the *Vasensische allgemeine Zeitung*. In 1854 he went to Munich as professor of economics, and five years afterwards was transferred to a chair of history of literature. He is better known as the author of valuable sketches of the history of civilization, and of novels and tales based on these same historical studies, but of such literary excellence that in the short story he ranks only below Heyse among modern German writers. Riehl's works include *Naturgeschichte des Volkes* (1851-69; in many editions); *Die Pfälzer* (1857); *Kulturstudien aus drei Jahrhunderten* (1859; 5th ed., 1896); *Musikalische Charakterköpfe* (1853-77); *Aus der Ecke* (1875); 3d ed. 1890); *Lebensratse* (1888); *Religiöse Studien eines Weltkinles* (1894); and posthumously a romance, *Ein ganzer Mann* (1897).

RIEL, ré-él', LOUIS (1844-85). Leader of the so-called 'Riel's Rebellion' in Canada. He was born at Saint Boniface, Manitoba, and was of Indian and French-Canadian descent. He is said to have been educated for the priesthood in a Roman Catholic seminary at Quebec, but he did not take orders. He first came into prominence as the leader of the rebellion that broke out in 1869. In that year upon the purchase of the Northwest Territory from the Hudson's Bay Company by the Canadian Government the 'metis,' or half-breeds, of that section became alarmed lest they should lose some of their rights, and especially the title to their lands, and formed a 'council' to insist upon their claims. Of this 'council' Riel was secretary and John Bruce president; but Riel was the actual leader of the movement. On November 2d the malcontents refused to allow William McDougall, who had been appointed Lieutenant-Governor, to enter the Territory, and on the same day Riel took possession of Fort Garry. The 'council' then issued a proclamation to the settlers calling upon them to send representatives to a convention, which on December 1 issued a 'Bill of Rights,' and later formed a provisional Government, of which Riel became President. A considerable number of persons who opposed the new Government were seized and imprisoned, and by Riel's order one of these, named Thomas Scott, was executed. Attempts at a peaceful settlement of the difficulties having failed, the Dominion Government determined to put down the rebellion by force of arms. Accordingly, in the summer of 1870 Colonel Wolseley (afterwards Sir Garnet Wolseley, commander-in-chief of the British Army) was dispatched with a force of about 1400 men to the seat of trouble. Finding resistance hopeless, Riel and some of his associates fled to the United States, where he remained for some time. In 1873 and again in 1874, his friends elected him to the Dominion Parliament for the district of Provencher, and in the latter year, despite the fact that a reward of \$5000 had been offered for his capture, he attempted to take his seat, but was expelled, and in October a warrant of outlawry was issued against him. In 1877 he was confined for a time in a lunatic asylum in Quebec, but the next year he was again at large and is thought by some to have entered into a conspiracy with the Fenians for the conquest of the Northwest. Later he went to Montana, whence in 1884 he was invited by French half-breeds living near the forks of the Sa-katchewan

to come and assist them in forcing the Government to settle their claims to certain land grants and to give them certain other rights. Riel accepted their invitation, and in the following March was made President of the provisional Government, which was established at Saint Laurent. Troöps, however, were dispatched against the rebels, and the main stronghold at Batoche was taken by General Middleton. Riel himself was soon afterwards captured, and in July was brought to trial at Regina for high treason. His lawyers pleaded in his defense that he was insane, and this plea was to a certain extent borne out by peculiar religious ideas that he had announced; but he was nevertheless condemned to death, and on November 16, 1885, was hanged. Consult Begg, *History of the Red River Troubles* (Toronto, 1871), and the same author's *History of the Northwest* (ib., 1895).

RIEMANN, ré'män, GEORG FRIEDRICH BERNHARD (1826-66). One of the foremost German mathematicians of the nineteenth century, particularly in the field of geometry. He was born at Breselenz, near Dammenberg, in Hanover. He studied mathematics at Göttingen and Berlin, and received his doctor's degree at the former university in 1851, his thesis being a well-known contribution to the theory of functions, *Grundlagen für allgemeine Theorie der Funktionen einer veränderlichen complexen Grösse*. Three years later he was made privat-docent at Göttingen, then (1857) adjunct professor, and finally (1859), on the death of Dirichlet, full professor. His introduction of the notion of geometric order into the theory of Abelian functions, and his invention of the surfaces which bear his name, led to great and rapid advance in the function theory. To him, also, is due (1854) a new system of non-Euclidean geometry, ranking with that of Lobachevsky and Bolyai (see GEOMETRY), a system which he made known in his thesis, *Ueber die Hypothesen, welche der Geometrie zu Grunde liegen* (published posthumously, Leipzig, 1867). Riemann's writings, besides those already mentioned, are: *Vorlesungen über Schwerkraft, Elektrizität und Magnetismus* (1876; 2d ed. 1880, both posthumous); *Partielle Differentialgleichungen* (1869; 4th ed. 1900-01, both posthumous); *Mechanik des Obren; Elliptische Functionen, Vorlesungen mit Zusätzen* (1899); and his *Gesammelte mathematische Werke und wissenschaftlicher Nachlass*, edited by H. Weber and Dedekind (1876; 2d ed. 1892; French trans., 1898). He also contributed several memoirs on surfaces, which were published in the *Annalen* and in *Crelle's Journal*. For the life of Riemann, consult his *Gesammelte Werke*; Schering, *Bernhard Riemann, zum Gedächtniss*. For an elementary explanation of Riemann's surfaces, consult: Durège, *Theory of Functions* (Eng. trans., Philadelphia, 1896); Holzmüller, *Einführung in die Theorie der isogonalen Verwandtschaften und der Conformal-Abbildungen* (Leipzig, 1882).

RIEMANN, Hügo (1849-). A German writer on music, born at Grossmehlra, near Sondershausen. He was educated in theory by Frankenberger, studied the piano with Barthel and Ratzenberger, studied law, and finally philosophy and history at Berlin and Tübingen. After serving in the Franco-German war he entered the Leipzig Conservatory. Both as conductor and teacher at Bielefeld, he was most

active until 1878, when he became university lecturer on music at Leipzig. As the much-desired appointment at the Conservatory did not follow, he went, in 1880, as teacher of music to Bromberg; and, from 1881 to 1890, was teacher at the Hamburg Conservatory. After a short career at the Sondershausen Conservatory he went, in 1890, to the Conservatory at Wiesbaden. Near the close of 1895 he returned to Leipzig as lecturer at the university. In 1901 he became professor. Besides composing many piano-forte pieces, songs, a piano-forte sonata, six sonatas, a violin sonata, and a quartet for strings, he furnished after 1870 many critical, æsthetic, theoretical, and historical papers for journals. He also compiled a popular and eminently sound *Musik-Lexikon* (1882; 5th ed. 1899; Eng. trans., 1893-96).

RIEMENSCHNEIDER, rē'men-shnī'dār, TILMAN (c.1460-1531). A German sculptor of the Renaissance. He was born at Osterode, in the Harz Mountains, and in 1483 appears at Würzburg as a journeyman carver. He soon became one of the most influential citizens, being elected Burgomaster in 1520. In the religious troubles during the following years Riemenschneider was the head of the reforming element and sided with the peasants during the Peasant War. When the reaction came in 1525 he was expelled from the council, and from this time until his death in 1531 he lived in retirement. His principal works include the monument to Eberhard of Grumbach, in the Church of Rünpar (near Würzburg); "Adam and Eve" (1493) on the south portal of the Liebfrauenkirche at Würzburg, and the statues of Christ, John the Baptist, and the Apostles on the buttresses of the same church (1500-06); a Madonna and the tomb of John Trithemius in the Neumünsterkirche (1493); the portrait statues of the Bishops Rudolf of Scheerenburg and Lorenz von Bibra in the Cathedral. His masterpiece is the monument to the Emperor Henry II. and his wife Kunigunde in the Bamberg Cathedral (1495-1513). Other well-known works are the "Bewailing of the Body of Christ" (1508), a group in the church of Heidingsfeld, and his last work (1505), a high relief of the same subject in the church of Mairbrunn.

Consult his biography by K. Becker (Leipzig, 1849), and A. Weber (Würzburg, 1888), and the heliotype edition of his works by Streit (Berlin, 1888).

RIEMER, rē'mēr, FRIEDRICH WILHELM (1774-1845). A German scholar and literary historian, born at Glatz. He studied theology and philology at Halle, was a tutor in the family of Wilhelm von Humboldt (1801-03), and then for nine years lived with Goethe as his literary assistant and his son's tutor. In 1812 he became professor at the Weimar gymnasium; from 1814 to 1820 he was assistant librarian, and from 1837 to his death he was librarian-in-chief at Weimar. Riemer published some poetry, a Greek lexicon (1802-04), and *Mitteilungen über Goethe* (1841). He edited Goethe's correspondence with Zelter (1833-34), and his own letters were published in two volumes, *Briefe von und an Goethe* (1846) and in *Aus dem Goethehause* (1892, edited by Heitmüller).

RIENZI, rē-ā'nzē, COLA DI (c.1313-54). A Roman popular leader. He was born at Rome.

Until his twentieth year he lived among the peasants of Anagni; then he returned to his native city, where he studied grammar and rhetoric and read the Latin classics. The assassination of his brother by a Roman noble finally determined him to deliver the city from the barbarous thralldom of the barons. He assumed the significant title of "consul of orphans, widows, and the poor." In 1343 he was appointed by the heads of the Guelph party spokesman or orator of a deputation sent to the Papal Court at Avignon to beseech Clement VI. to return to Rome in order to protect the citizens from the tyranny of their oppressors. Here he formed a close friendship with Petrarch, through whose assistance he obtained a favorable hearing from his Holiness, who appointed him notary to the city chamber. In April, 1344, Rienzi returned to Rome; but reform, he found, was impossible without revolution. During three years he loudly and openly menaced the nobles, who, thinking him mad, took no steps to crush him. At last on May 20, 1347, surrounded by 100 horsemen and accompanied by the Papal legate, Rienzi delivered a magnificent discourse and proposed a series of laws for the better government of the community, which were unanimously approved. The aristocratic senators were driven out of the city, and Rienzi took the title of 'Tribune of liberty, peace, and justice,' and chose the Papal legate for his colleague.

Rienzi dispatched messengers to the various Italian States, requesting them to send deputies to Rome to consult for the general interests of the peninsula, and to devise measures for its unification. These messengers were everywhere received with enthusiasm, and on August 1, 1347, 200 deputies assembled in the Lateran Church, where Rienzi declared that the choice of an Emperor of the Holy Roman Empire belonged to the Roman people, and summoned Louis the Bavarian and Charles of Luxemburg, who were then disputants for the dignity, to appear before him. The step was wildly impolitic. The Pope was indignant at the transference of authority from himself to his subjects; and the barons gathered together their forces and renewed their devastations. After ineffectual resistance Rienzi resigned his functions and withdrew from Rome. His tenure of power had lasted only seven months. In the solitudes of the Neapolitan Apennines, Rienzi joined an Order of Franciscan hermits, and spent nearly two years in exercises of piety and penitence—all the while, however, cherishing the hope that he would one day 'deliver' Rome again. This ambition made him readily listen to a brother monk, who declared that Rienzi was destined, by the help of the Emperor Charles IV., to introduce a new era of happiness into the world. Rienzi betook himself at once to Prague, and announced to the Emperor that in a year and a half a new hierarchy would be established in the Church, and under a new Pope Charles would reign in the west and Rienzi in the east. Charles put the 'prophet' in prison, and then informed the Pope of the matter. In July, 1351, Rienzi was transferred to Avignon, where proceedings were opened against him, and he was condemned to death, but his life was spared and the next two years were spent in easy confinement in the French Papal city.

Meanwhile at Rome the great families were

manufactures, more anarchical, more desperately bent on spilling blood than ever; and at last innocent VI. sent Cardinal Albornoz to re-establish order. Rienzi was released from prison, and accompanied the Cardinal. In August, 1354, having borrowed money and raised a small body of soldiers, he made a sort of triumphal entry into Rome, and was received with universal acclamations. But misfortune had debased his character; he abandoned himself to good living, and his once generous sentiments had given place to a hard, mistrustful, and cruel disposition. The barons refused to recognize his government and fortified themselves in their castles. The war against them necessitated the incurring of heavy expenses. In two months, Rienzi's rule becoming intolerable, an infuriated crowd surrounded him in the Capitol and put him to death. Consult: Papenordt, *Cola di Rienzo und seine Zeit* (Hamburg, 1841); Auria, *Étude historique sur Nicole Rienzo* (Paris, 1888); Rodocanachi, *Cola di Rienzo* (ib., 1888).

RIENZI, DER LETZTE DER TRIBUNEN. An opera in five acts, text and music by Richard Wagner, first produced at Dresden, October 20, 1842. The libretto is founded upon Bulwer's novel of the same title, whose story it follows in the essential particulars. It is the last of Wagner's works in the purely operatic style, for thereafter, in the *Flying Dutchman*, *Tannhauser*, *Lohengrin*, and the *Ring*, Wagner adhered more and more rigidly to his music-drama principles. The music is characterized by melody, and a series of dramatic climaxes whose treatment is reminiscent of the Meyerbeer school.

RIEPENHAUSEN, rē'pen-hou'zen. FRANZ (1786-1831) and JOHANNES (1789-1860). German painters and engravers, born at Göttingen, sons and pupils of Ernst Ludwig Riepenhausen (1765-1840, favorably known through his engravings after Hogarth). In 1804 they studied under Tischbein at the Academy in Cassel, then in Dresden, and in 1807 went in Tieck's company to Rome, where they settled permanently and devoted themselves chiefly to the study of Raphael's works. Besides many religious paintings they produced conjointly the "Glorification of Raphael," and for the Guelph Hall at Hanover "Henry the Lion Protesting Frederick Barbarossa Against the Romans." They also collaborated in drawings to Goethe's *Faust*, in episodes from the life of Charlemagne, in 14 etchings, illustrating the "Life and Death of Saint Genevieve" (1806), a *Geschichte der Malerei in Italien*, with 24 outline drawings after Italian masters before Perugino (1810), and a series of drawings after the paintings of Polygnotus at Delphi, according to Pausanias. After the death of Franz, Johannes published a "Vita di Raffaello" in 14 plates, for which they had composed the drawings together, and also executed several large paintings such as "Raphael's Death" (1836), "Destruction of the Cenci Family" (1839), and others. Consult Andresen, *Die deutschen Maler-Künstler des neunzehnten Jahrhunderts* (Leipzig, 1872).

RIES, rēs, FERDINAND (1784-1838). A German composer, born at Bonn. He was the eldest son of Franz Ries (1755-1846), a musical director at Bonn. He studied piano with Beethoven, his father's friend, from 1801 to 1805 at Vienna, and became prominent by

his compositions and by his *Biographische Notizen über L. Beethoven* (1838). As a pianist he was most successful in his many concert tours through England, France, Russia, and Scandinavia. He was town musical director at Aix-la-Chapelle from 1834 to 1836. He wrote three operas: *Die Räuberbraut* (1828), *Liska* (1831), and *Eine Nacht auf dem Libanon*; two oratorios, *Der Sieg des Glaubens* and *Die Könige Israels*; overtures, symphonies, string quartets, violin sonatas, and a trio for two pianos and a harp.

RIESA, rē'zā. A town and railway centre in Saxony, on the Elbe, 33 miles by rail northwest of Dresden. A large bridge of iron and stone here spans the river (Map: Germany, E 3). The town has a public library and a municipal hospital, and various special schools. The harbor is good and possesses ample shipping facilities, and Riesa is consequently the centre of important shipbuilding interests and of a large trade, including fish, oil, coal, lumber, grain, iron ore, etc. Sandstone, which is quarried extensively, is also shipped. There are rolling mills and many other manufactories. Population, in 1900, 13,477.

RIESE, rē'ze, ALEXANDER (1840—). A German classical scholar, born and educated at Frankfurt-on-the-Main. Besides his excellent editions of Varro's *Satira Menippeæ* (1865), of the *Anthologia Latina* (1869-70; 2d ed. 1894), of Ovid (1871-77), of the *Historia Apollonii Regis Tyri* (1871, 2d ed. 1893), of Catullus (1884, with commentary), and of Phædrus (1885), he published a suggestive essay, *Idealisierung der Naturvölker des Nordens in den griechischen und römischen Litteraturen* (1875), and two monographs on early German history, *Das Rheinland in der Römerzeit* (1889) and *Das Rheinische Germanien in der antiken Litteratur* (1892).

RIESENER, rē'ze-nēr, JOHANN HEINRICH (1734-1806). A German cabinet-maker, born at Gladbach, Rhenish Prussia. Early in life he went to Paris and entered the workshop of Johann Franz Oeben (died 1766, a pupil of Boulle and protégé of Madame de Pompadour), after whose death he married his widow, carried on his business and was received as master into the Paris guild in 1768. Specimens of Riesener's work, in the style of Louis XV., executed for the royal palaces, may be seen at Fontainebleau, Trianon, Compiègne, and in the Musée du Mobilier National, Paris, while the majority of it was sold abroad, particularly into England, in consequence of the Revolution.

RIESENGBIRGE, rē'zen-ge-bēr'ge (Ger., giant mountains). The highest range of the Sudetic Mountains (q.v.).

RIESI, rē-ā'zē. A town in the Province of Caltanissetta, Sicily, situated near the Salso, 14½ miles south of Caltanissetta (Map: Italy, J 10). There are sulphur mines and a trade in wine and olive oil. Population (commune), in 1901, 14,944.

RIETI, rē-ā'tē. A town in the Province of Perugia, Italy, situated on the Velino, 45 miles northeast of Rome (Map: Italy, G 5). It is well built and surrounded by walls. The fifteenth-century cathedral has a monument by Thorvaldsen. There are an old castle, a bishop's seminary, a gymnasium, a lyceum, a technical

school, and a public library of 30,000 volumes. The chief trade is in wine, oil, and fruit. Rieti, the ancient *Reate*, was a noted city of the Sabines. Population (commune), in 1901, 17,977.

RIETSCHEL, rêch'el, ERNST (1804-61). An eminent German sculptor, founder of the Dresden school of plastic art. Born at Pulsnitz, Saxon Lusatia, December 15, 1804, he underwent the severest privations in his youth, and began his artistic training at the Dresden Academy, in 1820, still contending with extreme poverty, until he won prizes for his drawings, which were, moreover, bought for the academy as models to be copied. In 1826 he became the pupil of Rauch, in Berlin, and in 1827 was granted a stipend by the Saxon Government, of which, however, he did not avail himself for the purpose of visiting Italy until 1830, after having assisted his master in the completion of various works, notably of the monument to King Max I. at Munich, in 1829. From Italy he returned to Berlin in 1831, and in 1832 was appointed professor at the academy in Dresden, where he resided until his death, February 21, 1861.

Rietschel's first work of importance was the "Monument of King Frederick Augustus I." (1829-39), in the Zwinger at Dresden, but simultaneously he worked on the twelve great reliefs, illustrative of the "Main Epochs of Civilization" (1835-38), in the Aula of Leipzig University. Next came the admirable group in high relief, in the pediment of the Opera House in Berlin (1844), with the "Muse of Music" in the centre, and from about the same time dates "The Christ Angel," a beautiful relief, widely known through reproductions, and presented by the master to the Art Union of Dresden. The first work to give evidence of Rietschel's accomplished mastery, and to demonstrate his peculiar tendency in art, was the famous "Pietà" (c.1847), constituting the finest ornament of the Friedenskirche at Potsdam. Among his best creations are to be numbered the statues of "Thier," the agriculturist (1850), at Leipzig, and of "Lessing" (1853), at Brunswick, a truly classical example of realistic portrait sculpture. In 1852 he began the "Emblematic Sculptures" on the exterior of the Dresden Museum, the cornice of which he also adorned with statues of "Pericles," "Phidias," "Giotto," "Dürer," "Holbein," and "Goethe." In the meanwhile he also modeled the heroic-size "Goethe-Schiller Monument" (erected 1857) for Weimar, and in 1857 fashioned his celebrated bust of "Rauch," unsurpassed probably by any portrait bust of the century. This was followed by the "Quadriga" (1860), with the magnificent figure of "Brunonia," for the ducal palace at Brunswick, executed in copper by Howaldt. In the same year was unveiled the masterly statue of "Weber" at Dresden. For the Walthalla, Regensburg, he executed the busts of "Luther," "Electeur Augustus II.," besides other busts and relief portraits. Of his last and most elaborate production, the "Luther Monument" at Worms, he was only able to finish the figures of Luther and Wielif, while the completion of his design was intrusted to his pupils Donndorf and Kietz (1868). A collection of casts and models of all his works is preserved in the Rietschel Museum at Dresden. Consult his *Autobiography*, edited and supplemented by Oppermann (Leipzig, 1873); Pecht, *Deutsche Künstler*, i. (Nördlingen,

1877); and *Biographisch-zwischen Rauch und Rietschel* (Berlin, 1890-91).

RIETZ, rîts, JULIUS (1812-77). A German conductor and composer, born in Berlin. He studied the fiddle under Schmidt, Bernhard Romberg, and Gaus; and when sixteen years old, joined the orchestra of the Königstädter Theater, for which he wrote the music to Holtei's play *Lorbeerbaum und Bettelstab*. In 1834 he was appointed assistant conductor at the Düsseldorf Opera under Mendelssohn, whom he succeeded the following year. In 1847 he was called to Leipzig as theatre kapellmeister and conductor of the Singakademie. In 1848 he succeeded Mendelssohn as conductor of the Gewandhaus concerts and as teacher of composition at the Conservatory. He was called to Dresden in 1860 to succeed Reissiger as Court kapellmeister. Here he conducted the opera and afterwards undertook the direction of the Royal Conservatory. As a composer he belongs to the younger classic school and was strongly opposed to the Neo-German movement. Among his works are the operas, *Das Mädchen aus der Fremde* (1833) and *Jery und Babely* (c.1840); three symphonies, several overtures to plays, flute sonatas, violin sonatas, motets, masses, psalms, and a quantity of other church music. He died at Dresden.

RIEZLER, rîts'ler, SIGMUND VON (1843-). A German historian, born in Munich. He was educated there, became a docent in 1869, and after ten years as head of the archives and library of Donaueschingen was made court and city librarian in Munich, in 1883, and director of the Maximilianeum in 1885. His works, dealing for the most part with Bavarian history, include: *Das Herzogtum Bayern zur Zeit Heinrichs des Löwen* (1867, with Heigel), *Der Kreuzzug Kaiser Friedrichs I.* (1870), the great *Geschichte Bayerns* (1878-99), *Die bayerische Politik im Schmalkaldischen Kriege* (1895), and *Geschichte der Heerenprozesse in Bayern* (1896).

RIFF, THE (Er-Rif). A name given to the mountain region bordering the north coast of Morocco from Ceuta eastward nearly to the borders of Algeria and included in the Atlas system. The rugged coast, the principal projection of which is Cape Tres Forcas, is almost without harbors. The inhabitants are pure Berbers in blood. In the French conquest of Algeria they were not molested, and they are said to live in a state of chronic revolt against the Sultan of Morocco. They were formerly noted for piracy. The people understand or speak Arabic only to a very slight extent, Shleh or Shluh being their native tongue. They are said to be untrustworthy.

RIFLE-BIRD, or RIFLEMAN. An Australian bird of paradise (*Ptiloris paradisius*), with a long curved bill, and in size about equal to a large pigeon. The upper parts are velvety black, tinged with purple; the under parts velvety black, diversified with olive-green. The crown of the head and the throat are covered with innumerable little specks of emerald green, of most brilliant lustre. The tail is black, the two central feathers rich metallic green. The female is much more plainly colored. The name was given by early Australian settlers in allusion to the resemblance between the plumage of the male and the uniform of a familiar rifle brigade.

RIFLEMAN AND RIFLE CORPS. Formerly, the term rifleman designated an infantry soldier armed and equipped so as to be capable of greater mobility and more effective marksmanship than was possible with the ordinary infantry soldiers of the line. Modern conditions, however, demand that all regiments alike possess these qualities, so that, with the exception of uniform, the rifleman of to-day differs in no material way from his comrade in the line. Throughout the armies of Europe the rifle regiments are dressed in uniforms of black, dark green, or some other shade of inconspicuous color. In England, the Rifle Brigade, King's Royal Rifles, Irish Rifles, and Scottish Rifles (see CAMERONIANS) constitute the entire rifle establishment of the Regular Army, and are all distinguished by their dark green uniforms, varied only by the facings, or the tartan trews of the Cameronians. The term rifleman is frequently used as being synonymous with sharpshooter (q.v.), but such is no longer the case. When in 1779 the volunteer citizen soldier became an integral factor in English national defense, he was spoken of as a rifleman, and his regiment as a volunteer corps. His uniform was gray, the particular shade of which has since been known as rifle-gray.

In the United States Army, the preëminent characteristics of the soldier, whether mounted or dismounted, have ever been those of the rifleman. The tactics employed by the Colonials against the British were later developed by long experience in Indian fighting, so that the ability to skirmish and shoot became marked characteristics of the frontier soldier. The mounted rifleman is a product of comparatively recent military development. See MOUNTED INFANTRY.

RIFLING. See ORDNANCE; SMALL ARMS.

RIFT VALLEY. A depression in the earth's crusts formed by a vertical displacement of the strata. In some instances there is a single line of displacement, along which the strata on one side have been depressed, but quite often there are a series of faults running in parallel directions and dividing the strata into blocks which show the effects of differential movement. The depressions thus formed may be occupied by rivers or lakes and in time they lose their characteristic sharp contours, taking on the appearance of ordinary erosional valleys. Rift valleys are common in mountainous districts all over the world. The Great Basin region, particularly in southeastern Oregon, affords many fine examples and those occupied by the great lakes of Central Africa are especially noteworthy.

RIG (of a vessel). See SNIP.

RIGA, rē'gá. A seaport of Russia, capital of the Government of Livonia and the seat of the Governor-General of the Baltic Provinces, situated on the Düna, about 10 miles above its mouth in the Gulf of Riga, 363 miles southwest of Saint Petersburg (Map: Russia, B 3). The old town on the right bank of the Düna has the appearance of a mediæval German town, while the suburbs, which contain the bulk of the population, are largely modern. Riga possesses comparatively few ancient buildings. There may be noted the Dankirche, founded originally in the thirteenth century, but rebuilt in the sixteenth and containing one of the largest organs in the

world; and the Church of Saint Peter, with a steeple 440 feet high.

The castle, now the residence of the Governor-General and the seat of the administration, the house of the Black Heads, the exchange, the guild houses, and the theatre may also be mentioned. Riga is better provided with educational and charitable institutions than most Russian cities. It has a polytechnicum with over 1400 students, a seminary for priests, a school of navigation, and a municipal museum. It occupies the third rank among the seaports of Russia and the second among the Baltic seaports.

Riga is also an important industrial centre. The chief manufactures are machinery, railway cars, lumber, leather, candles, tiles, glass, tobacco products, etc., the annual value of its manufactures exceeding \$30,000,000. The principal harbors of Riga are those at the mouth of the Düna and the Mühlgraben, nearer to the city. Lighter craft go up to the city by the canalized river. The harbor is frozen for a considerable part of the year and is not well protected. Riga has latterly grown in commercial importance. The average value of its annual exports rose from about \$26,000,000 for the period of 1891-95 to over \$35,000,000 for the period of 1896-1900; while the imports increased from about \$13,000,000 in 1891-95 to nearly \$27,000,000 in 1896-1900. The principal exports are cereals, flax and flaxseed, eggs, and lumber; and the chief imports, machinery, cotton, coal, and groceries. The population rose from 169,329 in 1881 to 282,943 in 1897. About 50 per cent. of the population is German.

Riga was founded by Albert L. Bishop, of Livonia, in 1201. An episcopal see was established here, which soon was erected into an archbishopric. The town attracted many colonists from Germany on account of the commercial privileges granted to it by its founder, and became a flourishing member of the Hanseatic League. Its burghers were involved in conflicts with the archbishops, who sought to hold the city under their temporal power, and with the Teutonic Knights. About the middle of the sixteenth century Riga passed into the possession of the King of Poland. Soon after the archbishopric was abolished. In 1621 the city was taken after a long siege by Gustavus Adolphus of Sweden. It passed to Russia in 1710. Consult: Neumann, *Das mittelalterliche Riga* (Berlin, 1892); Tobien, *Ergebnisse der Riger Handelstatistik, 1866-91* (Riga, 1893); Mettig, *Geschichte der Stadt Riga* (Riga, 1895); *Der Stadt Riga* (Riga, 1901).

RIGA, GULF OF. An inlet of the Baltic Sea, extending in a southerly direction between the governments of Esthonia, Livonia, and Courland (Map: Russia, B 3). It is about 100 miles long and over 70 miles wide. Its water is less salty than that of the Baltic Sea. The gulf never freezes over entirely and is ice free for about two-thirds of the year along the coast. At its southeastern corner it receives the River Düna. At the entrance to the gulf lie the islands of Oesel, Dago, and Mohu.

RIGAS, or **RHIGAS**, rē'gias, KONSTANTINOS (1754-98). A Greek patriot and poet, born at Veles-tinos (ancient Pheræ). Until 1790 he was in the employ of the Hospodar of Wallachia and then, joining the revolutionary party, attempted, first to form an anti-Turkish committee in

Vienna, and then at Venice to influence Bonaparte in behalf of Hellenic independence. He was imprisoned by the Austrians and surrendered to the Turks, who executed him at Belgrade. His collected songs were published in 1814 and the Greek paraphrase of the *Marseillaise* is attributed to him. Consult the *Life* by Perrhaivos (Athens, 1860).

RIGADOON (Fr. *rigodon*, *rigandon*, said to be named after *Rigand*, a French dancing master). A lively dance of French origin. It was popular in the time of Louis XIII., and was introduced into England toward the last of the seventeenth century. The rigadon had an unusual jumping step, and the music in $\frac{3}{4}$, or common time, was spirited.

RIGAUD, rē'gō', STEPHEN PETER (1774-1839). An English astronomer and historian of mathematics. He was born at Richmond in Surrey, of Huguenot refugees, and was educated at Exeter College, Oxford, where he became lecturer on experimental philosophy and Savilian professor of geometry in 1810. He succeeded his father as observer to the King at Kew (1814) and followed Abraham Robertson as Savilian professor of astronomy in 1827. In Radcliffe Observatory, which came under his charge at this time, he discovered important manuscripts of Bradley and of Harriot and many other papers. Rigaud published: *The Miscellaneous Works and Correspondence of Dr. Bradley* (1831, with memoir; 2d ed. 1833); *An Historical Essay on the First Publication of Newton's 'Principia'* (1838); and *The Correspondence of Scientific Men of the Seventeenth Century* (1841, edited by his son; reedited by De Morgan, 1862).

RIG'BY, ELIZABETH. The maiden name of the English author Lady Elizabeth Eastlake (q.v.).

RIG'DON, SIDNEY (1793-1876). A Mormon elder. He was born in Saint Clair township, Allegheny County, Pa. He was pastor of a Baptist church in Pittsburg (1822) and afterwards was a minister of the Disciples' Church in Ohio. It has been claimed that here he became acquainted with a romance of prehistoric America, written in 1812 by Solomon Spaulding, an eccentric Congregational minister in Ohio, and that this was the 'source, root, and inspiration' of the Book of Mormon. The claim has not been substantiated, and there is no positive evidence against the statement of Joseph Smith that he met Rigdon for the first time in December, 1830. Rigdon was closely associated with Smith after the latter's removal to Ohio (1831), and accompanied him to Missouri and Nauvoo, where he was one of the three presidents of the new Church. He refused to acknowledge the authority of Brigham Young after the death of Smith, was excommunicated for contumacy, and returned to Pittsburg, but never gave up his Mormon faith. He died at Friendship, N. Y.

RIGG, JAMES HARRISON (1821-). An English clergyman and educator, born at Newcastle-on-Tyne. He was educated at Old Kingswood School and entered the Wesleyan Methodist Ministry in 1845. In 1868 he became principal of the Wesleyan Training College, Westminster, London. He was English correspondent of the *New York Christian Advocate*, and for several years was on the staff and afterwards became sole editor of the *London Quarterly Review*. His

works include: *Wesleyan Methodism and Congregationalism Contrasted* (1852); *Modern Anglican Theology* (1857, 1859, 1880); *The Churchmanship of John Wesley* (1868, 1878, 1886); *The Living Wesley* (1875, 1891); *Dr. Pascoe, His Character and Life Work* (1883); and *Oxford High Schools and Its Choir Leaders* (1895, 1899).

RIGGING (from *rig*, from *Notweg*, dialectic Swed. *rigga*, to rig; probably connected with AS. *urion*, ONorthumb. *urra*, archaic Eng. *urra*, to cover). The rigging of a vessel includes all the ropes and chains used to support or operate her masts, yards, booms, galls, sails, etc. It is of two kinds, standing rigging and running rigging. The former is semi-permanent and chiefly consists of supports to the masts such as shrouds, stays, backstays, etc. When once in position these are not moved except when they require slight adjustment or renewal. Yards, galls, and booms have some standing rigging for their support or for other purposes. Standing rigging is usually of wire or hemp rope; if the former it is commonly painted, or galvanized, or both; if of hemp, it is tarred. For further preservation standing rigging is parceled (wrapped with tarred or painted canvas) and served (wrapped closely with marline or spun yarn). The running rigging of a ship comprises the moving or movable ropes which are used to operate the yards, galls, booms, and sails, or to raise and lower the upper masts, hoist weights, and the like. Such ropes are chiefly of manila fibre, but some are of untarred hemp or cotton and others of flexible wire or chain. The most important ropes of the running rigging are the braces (used to swing the yards or keep them properly pointed), the halliards (used to hoist the yards or sails), and the gear attached to the sails (q.v.), such as sheets, clewlines, buntlines, etc. See *SAIL*; also *SIMP*.

RIGGS, ELIAS (1810-1901). An American missionary and linguist. He was born at New Providence, New Jersey, graduated at Amherst College in 1829, and at Andover Theological Seminary in 1832. The same year he was ordained a Presbyterian missionary and entered the service of the American Board. The first six years of his missionary career were spent in Athens and Argos. In 1838 he was transferred to Smyrna, and in 1853 to Constantinople, where he continued in the service of the American Board until his death. Between 1856 and 1858 he visited America and during this time superintended the publication of his Armenian Bible and taught in the Union Theological Seminary. He was a member of the committee appointed by the British and Foreign Bible Society and the American Bible Society to prepare the publication of the Turkish Bible in both Arabic and Armenian versions, which was accomplished in 1878; and again a member of the revising committee who prepared a version suitable to the needs of common readers, issued in 1886. He published *A Manual of the Chaldean Language, Containing a Grammar, Chrestomathy, and a Vocabulary*, (1832, and subsequent editions); *Grammatical Notes on the Bulgarian Language* (1840); *Grammar of the Modern Armenian Language, with a Vocabulary* (1847); *Grammar of the Turkish Language as Written in the Armenian Character* (1856); *Translation of the Scriptures into the*

deeper American Language, with the aid of native scholars (1853, and subsequently); *Translation of the Scriptures into the Bulgarian Language*, assisted by native scholars and the Rev. Albert L. Long (1871); *A Harmony of the Gospels*, in Bulgarian (1880); *A Bible Dictionary*, in Bulgarian (1884).

RIGGS, JAMES STEVENSON (1853—). An American Presbyterian theologian, born in New York City. He graduated at Princeton in 1874, and after two years at Leipzig and Tübingen entered Auburn Theological Seminary. There he graduated in 1880, and in 1884, after a pastorate at Fulton, N. Y., became adjunct professor of biblical Greek. In 1892 he was appointed to the chair of biblical criticism and New Testament. His publications include *The Bible in Art* (1895) and *A History of the Jewish People During the Maccabean and Roman Periods* (1900).

RIGGS, STEPHEN RETURN (1812-83). A missionary among the American Indians, born in Steubenville, Ohio. He was educated at the Ripley (Ohio) Latin School, Jefferson College, and the Western Theological Seminary at Allegheny, and in 1837 was commissioned missionary at Fort Snelling. During the early years of his work he found time to publish lesson books in Dakota, and to prepare the manuscript for his *Grammar and Dictionary of the Dakota Language*, which was published by the Smithsonian Institution (1852). In 1883 his Dakota-English Dictionary was published by the Bureau of Ethnology.

RIGHI, *ri'gè*. A mountain of Switzerland. See **RIGI**.

RIGHI, AUGUSTO (1850—). An Italian physicist. He was born in Bologna and was educated at the university of that town. After holding various positions in the Physical Institute, he was called to be professor of physics at the University of Palermo, and was then elected professor of physics in the University of Bologna, Italy. Professor Righi has devoted himself almost entirely to the field of electricity and magnetism. His researches in regard to the connection between the magnetization of bismuth and other substances and their conduction of heat and electricity are classical. Immediately after the discovery by Hertz of the physical methods for the investigation of electro-magnetic waves Righi took up this line of work and made many important advances. It was in the elaboration of certain methods due to Professor Righi and by simple changes in his apparatus that Marconi succeeded in making use commercially of electric waves in wireless telegraphy (q.v.).

RIGHT (AS. *riht*, Goth. *raihhts*, OHG. *reht*, Ger. *recht*, right; connected with Lat. *rectus*, Av. *rusta*, right, straight, Skt. *rju*, right, and with Lat. *regere*, to direct, rule, Gk. *ῥέγειν*, *regain*, to stretch out), THE. In European politics, the name generally given to conservative parties in the national assembly. See **POLITICAL PARTIES**.

RIGHT OF WAY. See **WAY**.

RIGHTS, CIVIL. In the most general sense, rights secured to the individual by civil or municipal law. As thus employed the phrase is nearly identical with legal, as distinguished from moral or merely natural rights. It does not in a given case necessarily comprehend all the privi-

leges of citizenship, still less the privileges which political philosophers may claim as incident to citizenship. Thus the rights to life, to liberty, and to the pursuit of happiness, asserted in the American Declaration of Independence, are civil rights only in so far as they are defined and protected by the Constitution and laws of the United States. Further than that they are merely rhetorical and philosophical claims as to the rightful position of the individual in organized society.

The expression 'civil rights' thus includes the rights which people have and are legally capable of enforcing against one another, as well as those rights which individuals may assert and defend against the State. It is sometimes employed in a more limited sense, as referring only to the latter class of rights, such as are asserted in the Declaration of Rights made by the Lords and Commons of England at Westminster in 1688 and presented to William of Orange and Mary, his wife, as the conditions of their accession to the throne, the Bill of Rights passed by the British Parliament in 1689, such provisions of law as are embodied in the first ten amendments to the Federal Constitution of the United States, and corresponding or similar provisions in the constitutions of the several States. These provisions relate to the religious freedom of the citizen, to liberty of speech and of the press, to the right to assemble and petition for the redress of grievances, to the right to bear arms, to the protection of the individual against arbitrary arrest, to the guarantee of an orderly administration of justice, to the right of habeas corpus, and to security against arbitrary interference with property and the like.

In the United States the phrase 'civil rights' is employed in a specific sense to denote the rights intended to be secured by the fourteenth and fifteenth amendments to the Federal Constitution, adopted in 1868 and 1870 respectively, and by certain acts of Congress and of the Legislatures of the several States to the same effect. These constitutional provisions and legislations were a part of the reconstruction policy of the Government and were intended to secure the recently emancipated slaves in their freedom and in the exercise of the rights of citizenship which had been conferred upon them. The more important provisions of the two amendments referred to are (1) those forbidding the States to make or enforce any law which shall abridge the privileges or immunities of citizens of the United States, or to deprive any person of life, liberty, or property without due process of law, or to deny to any person the equal protection of the laws; (2) that providing for the reduction of the representation of a State in Congress in proportion to the number of its male citizens over twenty-one years of age who are denied the right of suffrage; and (3) that which declares that the right of the citizens of the United States to vote shall not be abridged by the United States or by any State, on account of race, color, or previous condition of servitude.

It is generally conceded that these provisions of the Constitution have failed of their object and that they have done little to secure to the negro in America the civil rights to which they refer. As to the second provision above enumerated, no effort has been made by the National Government to enforce it. The third provision has been generally evaded in the Southern States, and

in some of them the negro has been effectually excluded from the suffrage by constitutional and statutory provisions prescribing strict educational or property qualifications for the exercise of the right to vote.

The first provision, which aims to secure to all citizens equality of rights and privileges, though not as completely futile as the others to which reference has been made, has had a very limited effect. Being by its terms restricted to the acts of States, it does not extend to the acts of individuals, even though they be State officials in the performance of their public duties. Thus a statute of West Virginia providing that juries should be composed of 'white male citizens' is in conflict with the constitutional provision, and therefore void; but the act of a county judge in habitually excluding negroes from the juries which he was authorized by law to select from the citizens of the county at large was not controlled by the provision in question. Then, too, the operation of the provision has been more restricted by judicial construction, as in the decision that a statute forbidding the intermarriage of whites and blacks was not within the condemnation of the Constitution, as the amendment in question was designed to secure rights of a civil and political nature only and not social or domestic rights. It has also been held that the amendment does not add to the privileges and immunities of citizens, but only protects those which they already have. Thus it does not extend the franchise nor the right to serve on juries to negroes or to women who do not already possess it.

These illustrations show that the civil rights legislation of the nation at large has been of little effect. The more immediate and complete jurisdiction of the several States over their citizens, however, renders legislation of this character when enacted by them much more efficacious. Several of the Northern States have accordingly passed effective civil rights laws of the general tenor of the constitutional provisions above considered, but aimed at individual rather than governmental interference with such rights. Thus in many of the States railroad and other transportation companies, hotels, theatres, school boards, etc., are forbidden to discriminate against persons because of their color or previous condition of servitude, and such laws have been found to be reasonably capable of enforcement. The strong sentiment of the decade immediately following the Civil War has to a considerable extent abated, however, and, though the negro is still far from the enjoyment of the civil rights of his white fellow-citizens, the demand for such legislation as that above described has, at the beginning of the twentieth century, well nigh died out. This is probably due in a measure to a growing conviction that such rights are rather to be won by the growth of intelligence, virtue, and industry, than gained by legislation.

RIGHTS, DECLARATION AND BILL OF. A statement of the fundamental rights of the English nation prepared by the convention which called the Prince and Princess of Orange to the throne of England after the Revolution of 1688, and which was imposed on William and Mary as a condition of their succession to the crown. This declaration, drawn up by a committee of the Commons, and assented to by the Lords, began by declaring that King James II. had committed

certain acts contrary to the laws of the realm. The King, by whose authority these unlawful acts had been done, had abdicated the throne; and the Prince of Orange having invited the estates of the realm to meet and deliberate on the security of religion, law, and freedom, the Lords and Commons had resolved to declare and assert the ancient rights and liberties of England.

This declaration of rights was presented to the Prince and Princess of Orange at Whitehall, and accepted by them with the crown. Being originally a revolutionary instrument, drawn up in an irregular assembly, it was considered necessary that it should be turned into law. The declaration of rights was therefore brought forward in the Parliament, into which the convention had been turned, as a bill of rights, and passed the Commons; but an amendment proposed in the Lords regarding the settlement of the crown on the issue of the Princess Sophia, in the event of Mary, Anne, and William all dying without issue, led to several intellectual conferences between the two Houses, which ended in the measure being dropped. The bill was, however, reintroduced in the following session of Parliament (1689) without the proposed amendment, when it passed both Houses, and obtained the royal assent—a clause, however, being added, which originated in the House of Lords, to the effect that the kings and queens of England should be obliged, on coming to the throne, in full Parliament or at the coronation, to repeat and subscribe the declaration against transubstantiation, and that a king or queen who should marry a Roman Catholic would be incapable of reigning in England, and his or her subjects would be absolved from their allegiance. The coronation provisions in the Declaration of Rights have been closely adhered to in England ever since the days of William, but recent enactments of Parliament (1901) have rendered it possible to make certain modifications in the coronation oath, whereby Roman Catholics may not be offended, especially in the declaration against transubstantiation. The text of this declaration may be found in Adams and Stephens, *Selected Documents of English Constitutional History* (New York, 1901).

RIGHTS, LEGAL. In attempting to define a legal right, juristic writers lay more or less stress upon the following points: (1) A legal right is a power or complex of powers accorded by the law to a person, natural or ideal. The person to whom a right is accorded, in whom it is vested, is sometimes termed the 'person of inherence.' (2) A legal right implies a general duty of all other persons not to interfere with its exercise. If a right entitles its holder to demand from a particular person a special forbearance or a special act, a special duty rests upon that person. The persons upon whom duties rest, or against whom rights run, are sometimes termed 'persons of incidence.' (3) From the correspondence of rights and duties it results that the law may create rights by implication, by imposing general or special duties. (4) Rights are limited powers. Unlimited powers belong only to the sovereign, the State. (5) Rights protect interests. The interests protected may be public or private or mixed.

It is not always admitted that every legal right implies a corresponding general duty of non-interference. It is often asserted that obli-

gations which are rights *in personam* (q.v.), calling for acts of forbearance from particular persons, imply no duties resting upon other persons. Interference between obligors and obligees is, however, possible; and in some cases the law affords remedies. The question is of practical importance, because the theory that the rights of a creditor (e.g. those of an employer) have no protection against the acts of third persons tends to impede the development by the courts of adequate remedies for interference with such rights.

If all rights run against all members of the community, it is unnecessary and confusing to assert this especially of rights *in rem* (q.v.). Properly speaking, the substantive right *in rem* has no personal incidence until it is infringed. The infringement begets a remedial right which has personal incidence.

The right in its personal incidence was termed by the Romans *actio*, and is termed in English law 'right of action.' The German law uses the word 'claim' (*Anspruch*).

By substantive rights we mean those rights which constitute part of the normal legal order. Purely personal rights (life, liberty, physical integrity, reputation, etc.), family rights, rights *in rem*, and rights *in personam* which impose upon the person of incidence no duty except of forbearance—all these rights contemplate the maintenance of a certain state of affairs. As long as the contemplated state of affairs is maintained, these rights are satisfied. When it is disturbed, remedial rights come into existence. The prime remedial right, which every legal system recognizes, is that of defense against wrongful aggression. Early law gives further rights of self-help, but in every highly developed system these are greatly restricted. The private person whose right has been violated is regularly referred for redress to the courts; his remedial rights are rights of action in the narrower sense. If the invasion of the right is also a crime, the modern State exacts penalty of its own motion.

When substantive rights *in personam* impose upon the person of incidence a positive duty, e.g. to pay money or to do something, the right is unsatisfied until the duty is performed. In such a case a remedial right (right of action) exists side by side with the substantive right from the outset. This distinction is of importance in the law of prescription or limitation of actions (doctrine of *actio nata*). Some writers assert that in these cases there is no substantive right that is distinguishable or separable from the remedial right, but this is not the view held by the English courts.

Logically remedial rights are a consequence of substantive rights: 'where there is a right there is a remedy.' Historically substantive rights have been defined gradually by the development of remedies to meet particular wrongs.

The essential elements of rights related as means and ends are power and interest. These elements are separable. Power may be held by one person in the interest of another or of others. This is the aspect which family rights—rights of husbands, fathers, and guardians—assume in highly developed law. This is the position assigned in English law to executors and administrators. This is also at every legal system the position of the corporation. The legal power is

held by the ideal or juristic person, the corporation. The interest may be that of the members, as in the ordinary private corporation; or it may be that of the public, or of a section of the public, as in the charitable corporation, in the State, and in all the subdivisions of the State. In all these cases of separation of power and interest, the 'legal right' is in the natural or ideal person who holds the power, and the 'equitable right' in the persons whose interests are represented—the beneficiaries.

Corporations, unless prohibited by statute, may hold legal rights when the corresponding interest is that of another corporation. This is the origin of the popular term 'trust,' now loosely applied to all extensive industrial and financial combinations. A State may hold power in the interest of other than its members. During the period intervening between the Spanish-American treaty of peace and the establishment of the Cuban Republic, the United States, as the Supreme Court affirmed, held the sovereignty of Cuba in trust.

When a private person, natural or juristic, holds a legal right which subserves not only the interest of the holder, but a public interest also (mixed interest), such private person or corporation is in reality a quasi trustee. The right held is said to be 'affected with a public use,' and its exercise is subjected to public control.

The distinction between private and public rights is based on the character of the interest subserved rather than on the legal position of the person who exercises the power. When a citizen is exercising his right of voting we do not term him a public officer, but he is exercising a public right. When the State or any public corporation holds property as a financial investment or enters into a contract, the rights accruing to the State should be treated as private rights. This is the theory of the civil law (State as *fiscus*), but not of the English law as regards the sovereign nor of the American law as regards the nation or the several States. In Anglo-American law, however, the correct theory is applied in the case of other public corporations; and in our law we are working toward the correct practice through the establishment of courts of claims. For literature, consult the works referred to under JURISPRUDENCE; see also JUSTICE: LAW; NATURAL LAW.

RIGHTS, NATURAL. See NATURAL LAW.

RIGHTS OF MAN. The term applied to a group of fundamental rights embodied in a famous declaration adopted by the French National Assembly on August 26, 1789. It was drawn up principally by Dumont in response to the suggestion contained in several of the *cahiers* that in order to prevent the recurrence of abuses a clear statement of the rights of the individual should be prepared and given the sanction of the estates. It declares that all men are born and remain equal in rights; that social distinctions can be founded only on the general good; that law is the expression of the general will and every citizen has a right to participate in its enactment either personally or through his representative; that public burdens should be borne by all members of the State in proportion to their ability; that the elective franchise should be extended to all; that no one should be accused, arrested, or imprisoned except according to due process of law; that no one should be disturbed on account of his religious opinions; that the free

interchange of ideas is one of the most valuable rights of the citizen and hence every one may freely write, speak, or print without interference although subject to responsibility for abuse of the right; that all citizens have a right to decide personally or through their representatives as to the necessity of public contributions, to know how they are applied, etc. The declaration aroused general enthusiasm throughout France and appeared in modified form in the succeeding French constitutions down to 1848, and has served as a model for similar declarations in other Continental countries. Louis XVI, under the pressure of the events of October 5, after first refusing, was induced to support it. Much of the political philosophy embodied in the French declaration had appeared in the American Declaration of Independence and in the famous Virginia bill of rights of 1776. The principles embodied in the *Rights of Man* were attacked by Edmund Burke in his *Reflections on the French Revolution* and characterized as a declaration of anarchy. It was in reply to Burke's views that Thomas Paine (q.v.) wrote his *Rights of Man*, for which he was prosecuted in London for libel and found guilty. For the text of the French Declaration consult Robinson, *Revolutions in European History* (New York, 1903); consult, also, Abbott, *Rights of Man* (ib., 1902).

RIGHT WHALE. The Greenland whale (*Balaena mysticetus*), the foremost of the whalebone whales, so called because it was considered by the early whalers of the North Atlantic the 'right' or 'proper' whale among the various species they encountered. See Plate of WHALES and Colored Plate of MAMMALIA.

RIGI, rē'gè, or RIGHI. An isolated mountain on the border of the cantons of Schwyz and Lucerne, Switzerland, between lakes Lucerne and Zug (Map: Switzerland, C 1). Altitude, 5905 feet. It commands extensive views of some of the finest Swiss scenery. Two rack-and-pinion railways lead up to the summit. The entire mountain is covered with pastures and woods. Consult Türler, *Der Rigi* (Lucerne, 1893).

RIGID BODY. See MECHANICS.

RIGOR MOR'TIS (Lat., stiffness of death), or POST-MORTEM RIGIDITY. A peculiar evanescent stiffening of all the muscles of the body which occurs shortly after death. Both the voluntary and involuntary muscles are affected. The condition begins immediately after all indications of irritability to mechanical or electrical stimulation have ceased, but before putrefaction sets in. It affects the neck and lower jaw first, then the upper extremities, extending from above downward, and finally reaches the lower limbs. Rigor comes on more rapidly after muscular activity, is hastened by warmth and retarded by cold. When death is the result of acute diseases, and the muscles are well nourished, muscular irritability is prolonged, and rigor mortis sets in late, and persists for as much as two or three days. On the contrary, when death occurs from chronic or exhausting disease, rigidity commences early and passes off rapidly. Paralyzed muscles are not exempt from rigor mortis provided the paralysis has not been attended with excessive wasting of the muscular tissue. During the passage of a muscle into rigor mortis heat is developed, carbonic acid is liberated, and the reaction of the tissue becomes acid instead of alkali-

ne. The cause of post-mortem rigidity is now believed to be chemical, namely, the coagulation and separation of the muscle plasma. See MUSCLE.

RIG-VEDA, rīg' va'dā. The oldest and most important of the four Vedas. See VEDA.

RIIS, DR. JACOB AUGUST (1849-). An American journalist and author, born at Ribe, Denmark. He was educated in the Ribe Latin School and came to the United States in 1870. He had a varied experience as carpenter, coal-miner, farm laborer, cabinet maker, traveling salesman, and newspaper reporter, became editor of the *South Brooklyn News* for a group of politicians, and afterwards bought and for a time managed the paper. In 1877 he began reportorial work for the New York *Tribune* and soon became police reporter for that paper. Subsequently he was for many years police reporter for the New York *Sun*. He became prominent in tenement-house and school reform in the congested regions of lower New York, and aided greatly in the movement which introduced parks in those sections. In 1896 and 1897 he was executive officer of the Good Government clubs, and in 1897 became secretary of the New York Small Parks Commission. The results of much of his study among the poorer classes were presented in his well-known volume, *How the Other Half Lives* (1890). Other works by him are: *Out of Mulberry Street*, a collection of fiction (1896); *A Ten Years' War* (1900); and the autobiography, *The Making of an American* (1901), first published serially in *The Outlook*.

RIKWA, rik'vā, or RUKWA, or LAKE LEOPOLD. A lake basin in German East Africa lying in a branch of the Rift Valley, 50 miles east of the southern end of Lake Tanganyika (Map: Africa, H 5). Length, about 100 miles; width, 30. High and steep mountains surround it. In the dry season, however, the greater part of the basin is a dry plain. It has no outlet, and its water is saline. The lake is rapidly drying up. It was discovered in 1880 by Thomson.

RILEY, CHARLES VALENTINE (1843-95). A distinguished entomologist, born in London, England. He studied at Dieppe and Bonn, and in 1860 came to the United States. In 1868 he was appointed State entomologist of Missouri and he began with B. D. Walsh the publication of *The American Entomologist*. In 1877 he was appointed a member of the entomological commission to investigate the locust plague in the West, and in 1878 he became United States entomologist, in which capacity he served until 1894, except during the years 1879 and 1880. In 1884 he became curator of insects in the United States National Museum, to which he presented his collections. His publications were very numerous. They include the nine *Annual Reports on the Insects of Missouri* (1868-77); *Potato Pests* (1876); *Locust Plague in the United States* (1877); and *Annual Reports of the Entomologist of the Department of Agriculture* (1878, 1881-94).

Riley was ranked as the foremost economic entomologist of his time. He organized the Division of Entomology of the United States Department of Agriculture and was identified with the great progress made by the United States in the discovery of remedies for injurious insects. His work on the grapevine phylloxera gained him many honors from the French Government.

in the field of general biology he is known by his paper, "On the Causes of Variation in Organic Forms," published in the *Proceedings of the American Association for the Advancement of Science* for 1888.

RILEY, JAMES WHITECOMB (1853-). A popular American poet and public reader, who first came into public notice as "Benj. F. Johnson, of Boone." Riley's father was a well-to-do lawyer of Greenfield, but the son, instead of following the law, worked first as a sign-painter, and afterwards joined a company of strolling actors, for whom he used to remodel songs and write plays. His fame rests in part on his brilliant gift of mimicry. In 1873 he got a position on the staff of the *Indianapolis Journal*, to which paper his first verses were contributed in 1875. Much of his verse is written in the so-called 'Hoosier' dialect, but many of his most beautiful compositions are in pure English. The dialect poems deal with scenes of simple life, and are liked for their humor, pathos, originality, and sincerity, and for the feeling for Indiana character which they contain. Riley is also a genuine poet of childhood. His first book of verse appeared in 1883, entitled, *The Old Scrimmin'-Hole and Leren More Poems, by Benj. F. Johnson, of Boone*, and since then the volumes have been numerous. Among them are: *The Boss Girl, a Christmas Story, and Other Sketches* (1886), in prose; *Character Sketches and Poems* (1887); *Afterwhiles* (1888); *Old-Fashioned Roscs* (1888); *Pipes o' Pan; at Zelksbury* (1889); *Rhymes of Childhood* (1890); *The Flying Islands of the Night* (1891); *Neighborhood Poems* (1891); *An Old Sweetheart of Mine* (1891); *Green Fields and Running Brooks* (1893); *Poems Here at Home* (1893); *Arma-zindy* (1894); *A Child World* (1896); *The Rubaiyat of Doc, Sifers* (1899); *Home Folks* (1900); and the *Book of Joyous Children* (1902).

RIMBAUD, RAN'BO', JEAN ARTHUR (1854-91). A French poet and adventurer, connected with the Symbolist movement in French literature. He was born at Charleville (Ardennes), and was sent to a good school. He began to write verses as a child, and ceased to write them at nineteen. In 1871 he went to Paris, and there the 'Parnassians,' above all Verlaine, welcomed the precocious author of the *Bateau-Livre*. His connection with the Commune forced him to leave France shortly after this date, and, accompanied by Verlaine, he went to England and Belgium, where he had a violent quarrel with his friend, an account of which he published in *Une saison en enfer* (1873). In 1880 he went to North Africa, where he became a trader with headquarters at Harrar and Shoa. By 1890 he had accumulated a fortune and was ready to return to France, and to resume writing, but a tumor had developed on his knee, and he died at a hospital in Marseilles after the amputation of the leg. His poems were published in Paris in 1886, by Verlaine, who thought the author of them dead, and they attracted much attention. The *Illustrations* contains his sonnet on the vowels, and the few other poems that make him one of the most original of French poets. His works were collected by his brother-in-law, Patrice Berriehon, who also gives a sketch of his life in *Vie de Jean-Arthur Rimbaud* (1898). Consult, Whibley, "A Vagabond Poet,"

in *Blackwoods* (Feb., 1899), and Symons, "Arthur Rimbaud," in the *Saturday Review* (May, 1898).

RIMBAULT, EDWARD FRANCIS (1816-76). An English musical writer and editor, born in London. His father was Stephen Francis Rimbault, an organist and composer, and from him he received part of his instruction. In addition to this, he was a pupil of Samuel Wesley and Dr. Crotch. In 1838 he began to give lectures on English musical history, and two years afterwards, with E. Taylor and W. Chappell, he founded the Musical Antiquarian Society. He was lecturer at the Liverpool Royal Institute, at the Collegiate Institute, and at the Edinburgh Philosophic Institute. He produced only a few works: the operas *The Fair Maid of Islington* (1838) and *The Castle Spectre* (1839), a cantata, *Country Life*, and a number of songs of which *Happy Land* is the favorite. In addition to these, he wrote: *Who Was Jack Wilson, the Singer of Shakespeare's Stage?* (1846); *Bibliotheca Madrigaliana* (1847); *The Early English Organ-Builders and Their Works* (1864); and *J. S. Bach* (1869).

RIMINI, ré'mé-né (anciently *Ariminum*). A city in the Province of Forlì, Italy, situated on the Marecchia, near the Adriatic, 70 miles south-east of Bologna (Map: Italy, G 3). Rimini has regular streets, well-built houses, and many fine churches. The thirteenth-century Gothic cathedral was rebuilt in the Renaissance style of the fifteenth century. The interior is embellished with allegorical figures and frescoes. The city has a town hall with a picture gallery; an archaeological museum; and a library of 33,000 volumes. There are a technical school and a school of navigation. Among the objects of interest are the well-preserved marble bridge of Augustus over the Marecchia, a triumphal arch, and the remains of an amphitheatre. The port of Rimini is crowded with vessels engaged in the fisheries, which employ nearly half the population. The other industries are silk-spinning, salt-refining, and the manufacture of glass, rope, and furniture. Population (commune), in 1881, 37,078; in 1901, 43,203. Rimini was founded by the Umbrians. It became an important city under the Romans, and was the terminus of two great roads leading from Rome. Here, in B.C. 49, Julius Caesar began the war which made Rome an empire. In the thirteenth century Rimini passed under the rule of the powerful family of Malatesta (q.v.), who were dispossessed by Cesare Borgia in 1500; then for 25 years, beginning with 1503, it was subject to Venice. It was a Papal possession from 1528 to 1797, and from 1815 to 1860. The Council of Rimini, held in 359, condemned the teachings of Arius.

RIMINI, FRANCESCA DA. See FRANCESCA DA RIMINI.

RIMMER, WILLIAM (1816-79). An American sculptor, born in Liverpool, England. He studied medicine, but became a sculptor and lecturer on art subjects. He delivered the first course of lectures on art before the Lowell Institute of Boston, and gave courses also at Harvard University and (1870) at the National Academy in New York City. In 1866-70 he was director of the School of Design of Cooper Institute, New York. His sculptures include a colossal granite

head, "Saint Stephen," "Osiris," "The Falling Gladiator," and a statue of Alexander Hamilton (Boston). He published a volume on the *Elements of Design* (1864).

RIMMON. The name of a Syrian deity who had a temple in Damascus, according to II. Kings v. xviii. The word also occurs in proper names, although in such cases it is frequently difficult to decide between the name of the god and the word for pomegranate (Heb., *rimmōn*). Rimmon is now identified with the Babylon-Assyrian storm-god Rammau, who is also thought to be the same as the Syrian Hadad. See HADAD; RAMMAN.

RIM'SKY-KOR'SAKOFF, NICHOLAS ANDREYEVITCH (1844—). A Russian musician and composer, born at Tikhvin, in the Government of Novgorod. He became connected with the various important national musical organizations, and threw his influence toward the encouragement and development of a national Russian music. With Balakireff he was conductor of the Imperial Orchestra and the Russian Symphony concerts. His compositions, which are permeated with the Russian spirit, include operas, symphonies, church music, and arrangements of Russian folk-songs. He also wrote an important theoretical treatise on harmony.

RINALDO, rê-nâl'dô (Fr. *Renald, Renault*). The bravest of the sons of Aymon (q.v.). He figures prominently in the *Orlando Furioso*, *Orlando Innamorato*, *Gerusalemme Liberata*, *Renald de Montauban*, and other early romances, French and Italian.

RINALDO RINALDINI, rê-nâl-dô'nâ. A noted robber romance by Christian August Vulpius (1798), which was translated into many languages. It is the prototype of innumerable romances in the same field. A revised edition by Gildemeister appeared in 1890.

RINDFLEISCH, rint'flîsh, GEORG EDUARD VON (1836—). A German pathologist, born in Köthen and educated at Heidelberg and Würzburg. In 1856 he went to Berlin to work under Virchow, and in 1861 became Heidenhain's assistant in histology at the University of Breslau. After a short stay in Zurich he became professor at Bonn in 1865 and in 1874 at Würzburg, where a splendid pathological institute was built under his direction. He studied especially the diseases of the skin, and urged the scrofulous character of pulmonary tuberculosis. Rindfleisch's chief writings are *Lehrbuch der pathologischen Gewebelehre* (1866-69) and *Elemente der Pathologie* (1883), which were both translated into French.

RINE'HART, WILLIAM HENRY (1825-74). An American sculptor, born near Union Bridge, Carroll County, Md. He did his first work as a sculptor while a stone-cutter in a quarry on his father's farm. In 1855 he went to Florence, Italy, and in 1857 he returned to Baltimore, where he executed numerous busts and the two statuettes, an "Indian" and a "Backwoodsman," which act as supports for the clock in the House of Representatives. He returned to Italy in 1858, settling at Rome, where he died. In 1872 his marble statue of Chief Justice Taney was erected at Annapolis; there is a replica in Mount Vernon Square, Baltimore. He also completed the great bronze doors of the Capitol at Washington.

VOL. XVII.—11

which Crawford left unfinished at his death. His works may best be studied in the Cooper Art Gallery, Washington, and in the Peabody Institute, Baltimore. The former possesses his "Atalanta," "Latona and Her Children," "Diana," "Apollo," "Endymion," and "Rebecca;" in the latter are the works left in the sculptor's studio at his death, and his "Clytie Forsaken by Apollo," which is considered his masterpiece.

At his death he bequeathed his property to two trustees, W. T. Walters and B. F. Newcomer, by whose skillful management it was augmented to \$100,000. The administration of this trust was then given over to the Peabody Institute. Scholarships for the encouragement of young sculptors in Paris and Rome were established and in other ways the art of sculpture was promoted.

RING (AS. *bring*, OHG. *kring, ring*, Ger. *Ring*, ring; connected either with OChmch Slav. *krangŭ*, circle, or with Gk. *κύκλος, krîklos*, ring, or Skt. *śrūkhala*, chain). In the arts, a solid bar returning into itself, or a more flexible body of similar general form, always of comparatively small cross-measurement. The finger ring is the most important form. The form worn in ancient times was especially the signet ring; and this was often worn with a string going through the stone and around the finger. To replace this string by a gold or silver or bronze wire was an obvious convenience. When once the signet ring was established in popular favor it became so much a matter of course that bronze, or even cheaper material, was used, while the signet was often made of glass. It was also an obvious resource to engrave upon the metal chaton without inserting any stone whatever. Gold signet rings of this entirely metallic sort are common both in the collections of antique and those of recent Oriental finger-rings. Several rings made entirely of glass have been found in the islands of the Mediterranean, and the central gem, the chaton, is often a glass cameo, either really cut with the drill and wheel, or a mere cast of an original.

The connection of the finger-ring with the marriage ceremony is not essentially a Christian custom, having been practiced by the Jews, and also among pagan peoples, like the Norsemen. The ring is blessed by the priest and placed upon the third finger, from which a vein is supposed to go directly to the heart.

The divided ring, so arranged that one person could wear it, and that it might also be divided into two complete rings, has been used for betrothals. Other finger-rings are made which consist of several hoops linked together so that they cannot be separated, but will drop into a chain, and are then capable of being brought together and worn, although it is a puzzle to fit them into place.

Many savage tribes, and semi-civilized peoples, as in India, load the limbs, fingers, and even the toes with rings. They are often mentioned in the Bible as being used by the Jews and other Oriental peoples, not only for sealing and purposes of ornament, but as talismans to avert evil and bring good. The Mohammedans to-day wear rings inclosing verses from the Koran. Egyptian rings were often engraved with an image of the scarab. In Greece every freeman wore a ring of gold, silver, or brass, except the Spartans, who wore rings of iron. The latter custom pre-

vailed also in Rome under the Republic. Under the Empire to wear a gold ring was the special privilege of the senators, but afterwards it was extended to the knights, and under Justinian it was permitted to all freemen. The Romans practiced the most extravagant luxury with rings, and engraved gems were especially common. Among Celtic and Germanic tribes rings were worn on fingers, wrists, and ankles, and especially as torques, a kind of elaborate collar about the neck. The knights of the Middle Ages wore iron rings about the neck, arms, and legs as a symbol of a vow, upon the fulfillment of which the ring was removed.

Many quaint customs in regard to rings survive from the Middle Ages and even from earlier periods. Cramp-rings, supposed to heal that ailment, were blessed by the King, in connection with the healing of the 'King's evil.' Poison-rings, like the one used by Hannibal in his suicide, contained a layer of poison, and the Italian *anulo del morto* was a refined means of assassination during the Middle Ages. The ring played an important part in the principal Venetian state ceremony, the yearly marriage of the republic with the Adriatic. From the *Bucintaur*, the Doge cast a ring into the sea, in token of its subjection to the republic. The celebrated *fisherman's ring*, used by the Pope, is engraved with the picture of Saint Peter in a boat, and the name of the reigning pontiff. With such a ring all the Papal briefs since the thirteenth century have been sealed. Upon the Pope's death his ring is broken and another is presented to his successor by the city of Rome. The ring plays an important part in the coronation of a king, and in the investiture of bishops. Before the invention of coinage rings were used as money, as is recorded of the Egyptians, Israelites, and the German and Celtic peoples of Europe, and to this day copper rings are used by African traders.

Consult: King, *Antique Gems and Rings* (London, 1872); Jones, *Finger-Ring Lore* (ib., 1876); Schneider, *Die Gestaltung des Ringes vom Mittelalter bis in die Neuzeit* (Mayence, 1878); Edwards, *History and Poetry of Finger-Rings* (New York, 1880).

RING, MAX (1817-1901). A German novelist, born at Zauditz, near Ratibor, and educated at Breslau and Berlin. He practiced medicine until 1848, and, after two years at Breslau, settled in Berlin. In his novels, which are very numerous, he deals with modern social questions, and displays keen observation of human nature and ability to portray vividly scenes of want and misery. Chief among his works are: *Die Kinder Gottes* (1852); *Verirrt und Erlöst* (1855); *John Milton und seine Zeit* (1857); *Rosenkreuzer und Illuminaten* (1861); *Götter und Götzen* (2d ed. 1871); *Sieg der Liebe* (1886); and *Streber und Kämpfer* (1888).

RING AND THE BOOK, THE. A poem by Robert Browning (1869). A book recording an old murder in Rome, bought by the poet, suggested the plan, while the ring is the circle of evidence about the theme. Pompilia, a young girl, is married to an elderly Count Guido Franceschini. Each is deceived as to the other's wealth, and Pompilia is cruelly treated. She finally escapes to join her adopted parents under the care of a priest, Caponsacchi. Guido pursues them and murders Pompilia and her parents.

The story of the tragedy is told in ten versions by the actors, by the city, by certain officials, and by the Pope, making a poem of 20,000 lines. The finest parts are the monologues of Pompilia, the priest, and the Pope.

RING-BILLED GULL (so called from the colored ring about the beak). A small gull widely distributed throughout the interior of North America and along the coasts. The general color is light pearl-blue, the outer wing-quills black, the feet and bill greenish, and the bill encircled at the angle with a broad band of black. This gull breeds in colonies upon northern sea-beaches and on the shores of the lakes of the Northwestern States and Canada, and migrates southward in winter.

RINGBONE. A circle of bony matter around the horse's coronet, most common in the fore legs of draught horses with short upright pasterns, but occasionally also on the hind limbs of lighter-bred horses. Excessive work on hard roads is the most commonly attributed cause; proper rest and nourishment are the best preventives.

RING-DOVE. The largest and most common of European wild pigeons (*Columba palumbus*), which is characterized by a white spot on each side of its neck, forming a nearly continuous ring. See PIGEON.

RINGED PARROT. Any one of the small long-tailed Oriental parakeets of the genus *Palaeornis*, especially the ring-necked parakeet (*Palaeornis torquatus*), which ranges from India to Cochin-China, where it often does great damage to grain crops. Its general hue is green, and the neck of the male is ornamented with a rose-colored collar, incomplete in front, above which is a black ring incomplete behind. See PARRAKEET.

RING MONEY. At an early stage of society, prior to the invention of coinage, but after the inconveniences of direct barter had been discovered, the precious metals, formed into rings, were used as a medium of exchange. The use of ring money among the Egyptians is proved by representations in their wall paintings. The gold or silver rings were formed of a wire or bar of metal bent into a circle, but not quite united at the extremities, so that they could be made into a chain, from which portions could be detached at pleasure. It seems probable that the individual loops were not adjusted to a particular weight, but that each bundle of loops amounted in the aggregate to a particular weight. The ring money of the East found its way at an early period to Western Europe and the British Islands.

RING-NECKED SNAKE. A harmless American snake (*Diadophis punctatus*), about 15 inches long, blue-black above and orange-yellow below, with a yellow ring about the neck.

RING OF THE NIBELUNGEN. A tetralogy of music dramas, by Richard Wagner, comprising *Das Rheingold*, *Die Walküre*, *Siegfried*, and *Götterdämmerung*. The story is taken from the Nibelungenlied, but contains more of the Norse than German elements. The plot of Wagner concerns the magic nugget of gold in possession of the three Rhine maidens. He who shall forswear love and fashion the nugget into a ring shall gain supreme power in the world. In the *Rheingold*, Alberic, the Nibelung, seizes the gold, hav-

ing renounced love, and he fabricates the mighty ring. He also causes the magic Tarnhelm (cap) to be made. Wotan, chief of the gods, has promised to give Fréa to the Giants for building his castle. They, however, accept in lieu the treasure which Alberic has amassed by means of the ring. The maddened Alberic curses the ring and its possessor. In the *Walküre*, Siegmund draws the fateful magic sword from the tree-trunk, and wins the love of Sieglinde. Brunhilda disobeys Wotan by trying to shield Siegmund in his mortal contest with the lawful Hunding and thus having favored Siegmund's union with Sieglinde, the mother of the future Siegfried. Brunhilda is condemned by Wotan to helpless sleep, encircled by fire. In *Siegfried*, the hero at length appears, having been reared by Mimi, the Nibelung. He forges a magic sword (Needful), and kills the dragon which guards the fateful ring after which Wotan had lusted and thus foredoomed the reign of the gods. Siegfried also kills Mimi, who had intended to betray him. A bird tells him of the sleeping Brunhilda surrounded by fire. He seeks the spot, plunges through the fire, finds the Valkyrie and wins her. In *Götterdämmerung*, Siegfried gives her the ring on his setting out for fresh exploits, but keeps his wonderful sword and the Tarnhelm. Through magic, he falls in love with Gutrune, and proposes to give Brunhilda to Gunther. Siegfried wrests the ring from Brunhilda. She perceives his faithlessness and consents to his murder by those jealous of him. Hagen kills him, and the despairing Valkyrie mounts the funeral pyre with the dead Siegfried. The Rhine daughters regain the ring and the Valhalla burns.

RING-OUZEL, or MOOR BLACKBIRD. A European thrush (*Merula torquata*), well known in the less frequented parts of Great Britain, where it does great harm to ripening fruit. It is blackish brown, each feather edged with gray, and is conspicuously marked with a white crescentic throat-patch, from which it receives its name. In its notes, manner of nesting, and behavior generally it is much like an American robin.

RING-PLOVER. A plover of the typical genus *Ægialitis*, the species of which are characterized among other peculiarities by the dark ring or gorget around their necks. The American ringed plover, or 'ringneck' (*Ægialitis semi-palmata*) is dispersed in summer all over North America and breeds throughout Canada. Another species often called 'ring-plover' by the gunners is the piping plover (*Ægialitis meloda*). Consult Coes, *Birds of the Northwest* (Washington, 1874).

RING-SNAKE. The common snake of Great Britain (*Tropidonotus natrix*), so called because of the collar-like whitish markings behind the head. See WATER-SNAKE.

RINGSTRASSE, ring'sträſſe (Ger., Ring Street). A broad boulevard encircling what was the inner city of Vienna and containing a large number of magnificent public buildings. On or near it are situated the exchange, university, museums, houses of Parliament, the Court theatres, the town hall, the new Imperial palace, and several parks.

RING-TAILED IGUANA. An iguana (*Cyclura carinata*) of Jamaica, especially numerous

in the hills near Kingston, which is about four feet in total length, and olive-green, with the tail marked with blackish bands. These iguanas feed mainly on grass, are timid, galloping to the trees on the least alarm, and are uneatable, on account of a most disagreeable odor.

RINGWALDT, ring'valt, BARNHOLMUS (1530-90). A German didactic poet, born in Frankfurt-on-the-Oder. In 1578 he became pastor of a Protestant congregation at Langenfeld. He wrote some church hymns, of which all caught the swing of the popular poetry of the time, and one beginning "Herr Jesu Christ, du hochstes Gut" is still well known. They were republished in 1858. But he is more at home in didactic poetry, in which he denounces the evils of the day, even those within the Protestant body. *Die bunte Wahrheit* (1585) is an enchainment, *Die christliche Warnung des treuen Leichts* (1588) with its hero, who describes heaven and hell, gave Ringwaldt a rare opportunity for satire and the book was long popular. A third work, *Speculum Mundi* (1592), is cast in dramatic form and in greater degree portrays contemporary manners. Consult Hoffmann von Fallersleben, *Ringwaldt und Schmolck* (Breslau, 1835).

RINGWORM. A contagious parasitic skin disease due to the *trichophyton* fungus. It attacks the scalp, the body, and the beard, and according to its location is denominated *tinca tonsurans*, *tinca circinata*, and *tinca sycosis*. All three forms are exceedingly contagious and spread by contact, and by the use of hats, brushes, combs, towels, and razors in common. Ringworm of the scalp usually begins in the form of small circumscribed patches, the skin of which is more or less raised, pink, swollen, and covered with branny scales. As the disease progresses the patches become the seat of vesicles and pustules. The hair follicles are affected, and the hairs are seen to be broken off short, twisted and bent, and if placed under the microscope may be observed to be quite opaque, and converted into a mass of fungus spores. As a result of the loss of hair, baldness, more or less complete, but temporary, exists over areas sometimes as large as a silver dollar. Itching is a constant symptom. Sometimes inflammation is severe, with the formation of a boggy swelling, which exudes pus at many points. This condition is known as *kerion* and is apt to result in permanent baldness of the part affected.

Ringworm of the body occasionally coexists with *tinca tonsurans*, but often occurs alone. The disease begins as a small reddish, scaly spot of papules, at first irregular in shape, but soon assuming a circular form. As the area increases in size the papules change to vesicles. The spot heals in the centre as it spreads at the periphery. This variety of ringworm affects the face, neck, and arms most frequently. *Tinca sycosis*, or ringworm of the beard, is sometimes called 'barber's itch.' See FREN.

The essential point in the treatment of the varieties of ringworm affecting the hairy portions of the body is to apply to the roots of the hair one of the various parasiticides, but before this can be done the hair must be removed. This is done by shaving the affected areas and pulling out the loosened and diseased stumps with a pair of forceps. Crusts and scales must be loosened with hot water or oily applications. Among the parasiticides which act most effectively are sul-

paup ointment, mercurial ointments, and iodine, carbolic acid, and caustic potash alone or in various combinations. During the treatment of ringworm, especially that affecting the head, great care should be taken to prevent its spread to other children.

RINK, HENRIK JOHANNES (1819-93). A Danish explorer, born at Copenhagen. He studied natural science, acted as mineralogist to the *Galathea* expedition around the world in 1845-47, and from 1848 to 1851 explored Northern Greenland. There he found his life work. From 1857 to 1871 he was inspector of Southern Greenland; then for ten years he was director of the island's trade at Copenhagen; and in 1882 he removed to Christiania. He wrote: *Do Niekobarischen Inseln* (1847); *Grönland, geographisk og statistisk beskræet* (1852-57; Eng. trans., 1877); *Eskimoiske Eventyr og Sagn* (1866-71, English, 1875); *The Eskimo Tribes, Their Distribution and Characteristics* (1887-91); and *Grönlandere og Danske i Grönland* (1888).

RIO AGUSAN, ř'ó á-gwá'sán. A river of Mindanao, Philippine Islands (Map: Philippine Islands, K 11). It rises in the southeastern corner of the island and flows northward along the western base of the eastern coast range, passing in its middle course through several lakes and emptying into the Bay of Butúan through a large delta. It is the third largest river of the archipelago, the distance in a straight line from its source to its mouth being 125 miles. Its valley is very fertile and populous, the largest of the many towns on its banks being Butúan.

RIOBAMBA, ř'ó-bám'bá, or BOLÍVAR. The capital of the Province of Chimborazo, Ecuador, situated on the road from Quito to Guayaquil, 95 miles south of the former and almost at the foot of the volcano of Chimborazo, 9100 feet above sea level (Map: Ecuador, B 4). It is one of the most ancient and historic towns of Ecuador, and contains the ruins of an Inca palace, completely destroyed by an earthquake in 1797, it is now well laid out, and has a handsome new cathedral. Population, 12,000.

RIO BRANCO, brán'kó. The largest tributary of the Rio Negro (q.v.).

RIO CUARTO, kwár'tó. A town of Argentina, in the Province of Córdoba, situated on the Trans-Andean Railroad 200 miles west of Rosario (Map: Argentina, E 10). It is surrounded by orchards and is the principal market for large grazing districts. Population, in 1895, 13,812.

RIO DE JANEIRO, *Port. pron.* ř'ó dá zhá-ná'ro. An important State of Brazil, situated on the southeastern coast and bounded by the State of Espírito Santo on the northeast, Minas Geraes on the northwest, São Paulo on the southwest, and the Atlantic on the southeast (Map: Brazil, J 8). Area, excluding the Federal District, 26,630 square miles. The climate is moderate and healthful in the elevated portions, but hot and unhealthy in the lowlands along the coast. Rio de Janeiro is well wooded, and forest products both in the shape of timber and drugs figure prominently among the exports. The chief agricultural product is coffee. About 70 per cent. of the coffee goes to the United States. Sugar is cultivated along the coast. Industrially Rio de Janeiro is one of the most advanced of the Brazilian States. It has a large

number of cotton and woolen mills and sugar refineries, and a greater railway mileage in proportion to its area than any other State of Brazil. In 1896 it had more than 1200 miles. Population, 876,884 in 1890, and estimated at 1,227,575 in 1900. Rio de Janeiro is with the exception of the Federal District the most densely populated of the Brazilian States, having a density of about 50 per square mile. Most of the inhabitants are of mixed origin. The capital is Petropolis (q.v.).

RIO DE JANEIRO. The capital and largest city of Brazil, situated on the west side of the entrance to the Bay of Rio de Janeiro; latitude 22° 54' S., longitude 43° 10' W. (Map: Brazil, J 8). The location is exceedingly picturesque. The landlocked bay, which runs inland for 17 miles, is surrounded on all sides by forest-covered mountains whose spurs penetrate into the heart of the city. The narrow entrance and the islands lying inside of it are fortified. The city itself stretches for 15 miles along the shore, and from its nucleus at the inner end of the entrance it spreads out in long arms reaching far into the valleys and up the hill-sides. This nucleus is the old city, and forms the business quarter. It is laid out in square blocks with long, narrow streets. The largest square in this section is the Praça da Aclamação, with a beautiful garden. Another park, the Praça 15 de Novembro, is surrounded by some of the finest public buildings in Brazil, such as the mint, the Senate house, and the city hall. In this neighborhood also is the former Imperial Palace, now occupied by the National Museum. The most conspicuous church is the Candelaria, with two large towers and a cupola. The principal educational institutions are the great national library with 247,000 volumes and many manuscripts, the National Museum, the botanical garden, the Historical and Geographical Institute, and the observatory. There are also a medical school, a polytechnic institute, a conservatory of music, and various commercial, industrial, scientific, literary, and art academies.

Public charities are well provided for. There are institutes for the blind and the deaf mutes, a large insane asylum, and several well-equipped hospitals, that of Santa Casa da Misericórdia being one of the largest in the world. The public works, however, are somewhat inferior. There are an extensive system of electric street railways and a good water supply brought by aqueducts from the mountains. The drainage system, however, is not serviceable. This fact, together with the hot and humid climate, renders the city still an unhealthy place. Though yellow fever has decreased, there were still nearly 1000 cases of it in 1899.

Rio de Janeiro derives its chief importance from its commerce. The manufactures are relatively unimportant, and are represented chiefly by textile and flour mills. The harbor is absolutely safe, and is provided with extensive dock facilities. The shipping and trade have, however, decreased not a little during the past decade. In 1896, 1535 vessels of 2,469,628 tons entered; in 1900 only 843 vessels of 1,522,754 tons entered. The total value of imports in 1896 was \$61,386,000, and in 1900 \$45,985,320. The chief imports are cereals, coal, textiles, and machinery. The exports in 1900 amounted to \$42,805,000.

The leading export is coffee, of which 4,066,734 bags of 132 pounds each were exported in 1897, and 2,658,990 in 1900. The population of the Federal District (formerly called the Município Neutro), which includes the city and its suburbs, was, in 1890, 674,972, and in 1900, 779,000.

The first settlement at Rio de Janeiro was made by the French, who built a fort on one of the islands of the harbor in 1555, but were driven out by the Portuguese in 1557. The city itself was founded in 1567. In 1640 it was captured by the Dutch, who held it for a short time. In the middle of the eighteenth century it succeeded Bahia as the capital of Brazil. From 1808 to 1821 it was the residence of the Court of Portugal. Consult: Allain, *Rio de Janeiro, quelques données sur la capitale* (Paris, 1885); *Rio Janeiro, Archivo do districto federal* (Rio de Janeiro, 1894-97).

RIO DE LA PLATA, dá lá plá'tá. See PLATA, RIO DE LA.

RIO DE ORO, ó'ró. A Spanish possession on the west coast of the Sahara Desert, extending from Cape Bojador to Cape Blanco, 400 miles, and bounded on the north by Morocco, and on the south by French Sahara (Map: Africa, C 2). The Spanish territory extends about 250 miles inland, the eastern boundary being fixed by a Franco-Spanish convention in 1901. It is an arid, rocky and sandy plateau, about 1000 feet high, and covered with a scant growth of esparto grass near the sea, though there are a number of oases in the interior. The climate is very dry and hot, the temperature sometimes reaching 120°. The inhabitants are mixed tribes of Mohammedan Berbers and negroes, obtaining a scanty subsistence by raising cattle, sheep, and camels. The only Spanish settlement is at Rio de Oro, on a low peninsula near the centre of the west coast. The Governor here is under the Governor of the Canary Islands. Vessels from the latter exploit the fishing grounds along the coasts. Population, estimated (1903), 100,000.

RIO GRANDE, grã'n'dá. One of the head-streams of the Paraná River (q.v.).

RIO GRANDE, or **RIO GRANDE DEL NORTE**. A river of the Southwestern United States. It rises in the Rocky Mountains in southwestern Colorado, and flows first south through New Mexico, then southeast on the boundary between Mexico and Texas, and empties into the Gulf of Mexico, after a course of 1800 miles (Map: Texas, D 5). Its upper course passes through rocky gorges in which it forms rapids and cataracts, and lower down it becomes a shallow stream frequently obstructed by sand-bars. The greater part of it lies in an arid region, and in New Mexico its waters are largely drawn off for irrigation, so that during the dry season the river dries up for a considerable distance above and below El Paso. In its lower course it is subject to serious floods. It becomes navigable for small boats about 450 miles from its mouth. Near the latter lies the town of Brownsville, and opposite to it the Mexican town of Matamoras. Consult Stevens, *The Valley of the Rio Grande* (New York, 1864).

RIO GRANDE DE CAGAYÁN, dá kã'gá-yã'n'. The largest river of Luzon, Philippine Islands. It rises on the Caraballo Sur in Central Luzon and flows northward 200 miles through a magnificent valley, which is becoming an im-

portant tobacco-producing region (Map: Philippine Islands, F 2). It empties through the north coast into the Pacific Ocean. It is navigable for light draught steamers.

RIO GRANDE DE MINDANAO, men'dã'nã'o. The largest river of the Philippine Archipelago. See PELANGI.

RIO GRANDE DO BELMONTE, dô bel-mon'tã. A river in Brazil. See JACUINHONHA.

RIO GRANDE DO NORTE, nô'tã. A north-eastern State of Brazil, bounded by the Atlantic Ocean on the north and east, the State of Paraíba on the south, and Ceará on the west (Map: Brazil, K 5). Area, 22,490 square miles. The interior is elevated and sparsely watered; the coasts are low and slightly indented. The chief river is the Piranhas. The climate is hot, but not unhealthy. Rio Grande do Norte is one of the poorest States of Brazil in regard to natural resources. Cotton, coffee, and sugar are raised to a limited extent and cattle-raising is also engaged in. The population in 1890 was 268,273. The capital is Natal (q.v.).

RIO GRANDE DO SUL, sũl. The southernmost State of Brazil, bounded by the State of Santa Catharina on the north, the Atlantic Ocean on the east, Uruguay on the south, and Argentina on the west (Map: Argentina, G 9). Area, 91,250 square miles. The chief rivers are the Jacuhy, which falls into the Lagoa dos Patos, and the Ibicuí, a tributary of the Uruguay. The climate is temperate and healthful. The mean temperature varies from about 63° to 66°; frosts and snow are not infrequent in the more elevated parts, while fever is almost unknown. The chief occupation is cattle-raising. Mining of zinc, amethysts, and agates is also carried on to some extent. The chief product and export of the State is dried meat. There are a number of cotton, woolen, and linen mills, soap factories, and other manufacturing establishments. The commerce is quite extensive and the annual exports amount to over \$33,000,000. The commercial centre is the State capital, Porto Alegre. The State is well provided with transportation facilities. The population in 1890 was 897,455 and in 1900 it was estimated at 968,231. Rio Grande do Sul was colonized mostly by Germans. The foreign population amounts to about 50 per cent. of the total.

RIO GRANDE DO SUL. The chief port and former capital of the State of Rio Grande do Sul, Brazil, situated at the outlet of the Lagoa dos Patos into the Atlantic Ocean (Map: Argentina, G 10). The town lies in a barren, sandy plain, but has a safe harbor suitable for vessels of 15 feet draught. The entrance, however, is obstructed by sand bars. The city is connected by rail with Pelotas, and by steamers with Porto Alegre at the northern end of the lake. It exports beef and other cattle products, manioc, and Paraguay tea. Population, 19,000.

RIOJA, rê'õ'nã, Lã. A northwestern province of Argentina, bounded on the north by the Province of Catamarca, on the east by Córdoba, on the south by San Luis, and on the west by San Juan and Chile (Map: Argentina, D 7). Area, 34,506 square miles. The climate is very dry, and irrigation is generally necessary. Wheat, corn, lucerne, and wine are the chief agricultural products, and some stock raising is carried on. It

Rioja contains copper, sulphur, silver, gypsum, salt, graphite, and coal, the mineral most exploited being copper. The population in 1895 was 69,502. The capital is La Rioja, situated at the foot of Mount Belasco, and connected by rail with Catamarca and the southeastern provinces. It contains a college and a normal school, and had a population in 1895 of 6627.

RIOJA, FRANCISCO DE (c.1584-1659). A Spanish poet, born in Seville. He distinguished himself as a classical scholar at the university of his native town, and afterwards took orders and became canon in the Seville Cathedral. The Count of Olivarez, a friend of Rioja, called him to Madrid about 1614, and he remained at the Court some time. After the death of Philip III, he returned again and was made royal librarian and chronicler by Olivarez, whom he afterwards followed into exile (1643). His last years were spent in Seville and Madrid, where he was a member of the Inquisition. The best edition of his works is that of Barrera, who published the *Poesias* (1867), and *Adiciones á las poesias de D. Francisco de Rioja* (1872).

RIOM, rê-ôn'. The capital of an arrondissement in the Department of Puy-de-Dôme, France, picturesquely situated on a hill, 9 miles north of Clermont-Ferrand (Map: France, K 6). It is built of dark lava, and its domestic architecture of the fifteenth and sixteenth centuries and of the Renaissance period, and its churches, Saint Amable dating from the eleventh century, Notre-Dame-du-Marthuret from the fifteenth century, and the fourteenth-century Sainte-Chapelle, are of especial interest. Linen, leather, and brandy are manufactured. Riom was the capital of Auvergne during the fourteenth century. Population, in 1901, 11,061.

RION. A river of Caucasus, Russia, rising in the Government of Kutais. It flows in a western direction, passes Kutais, and enters the Black Sea at Poti. Total length, about 200 miles. It is navigable for 50 miles. The Rion is the ancient Phasis.

RIO NEGRO, rî'ô nâ'grô (Sp., black river). The largest north tributary of the Amazon. Its upper course is generally considered to be the Guainia, which rises in the southeastern part of Colombia and flows east to the Venezuelan boundary, then southeast into Brazil (Map: Brazil, E 4). Here it is joined by the Uapés, which rises on the eastern Cordillera of the Andes in the central part of Colombia, and flows in an east-southeast direction until it joins the Amazon through a great inland estuary 50 miles above the mouth of the Madeira. The largest tributary is the Rio Blanco or White River, which rises on the border of Guiana and flows south to the main stream. In Venezuela the Guainia receives the Cassiquiare, an arm sent out by the Orinoco. The total length of the Rio Negro with the Uapés is about 1400 miles. The whole river system flows through a vast forest region which is but little explored. The upper courses are navigable for long distances. At its mouth in the Amazon it is 1½ miles wide, and 100 feet deep at low water, so that ocean steamers can at all times go directly to Manóas, the great outlet for the rubber collected along the banks. Consult Wallace, *Travels on the Amazon and Rio Negro* (London, 1889).

RIO NEGRO. A river of Argentina, forming the conventional northern boundary of Patagonia (Map: Argentina, E 12). It is formed by two headstreams, the Limay and the Neuquen, both of which rise on the eastern slope of the Andes. It flows southeast into the Atlantic Ocean, and its length up to Lake Nahuel-Huapi (q.v.) is about 600 miles, through nearly the whole of which distance it is navigable, though there are dangerous reefs in several places. On its lower course there are several settlements, chief of which is Viedma.

RIO NEGRO. A territory of Argentina, in Patagonia, bounded by the Territory of Pampa on the north, Chile and the Territory of Neuquen on the west, the Territory of Chubut on the south, and the Province of Buenos Ayres and the Atlantic Ocean on the east (Map: Argentina, D 12). Its area is estimated at 75,924 square miles. The southwestern portion belongs to the region of the Andes, while the remainder is occupied by a plateau. The chief rivers are the Rio Negro and its tributary the Limay, and there are also a number of lakes. A very small portion of the territory is cultivated; the raising of sheep, cattle, and horses is the leading industry. Population, in 1895, 9241. Chief town, Viedma.

RIORDAN, rî'ôr-dan or rî'r'dan, PATRICK WILLIAM (1841—). A prelate of the Roman Catholic Church. He was born at Chatham, New Brunswick. He studied at Notre Dame, Ind., and at Paris and Louvain, Belgium, in which latter country he was ordained priest in 1865. Returning to America, he became one of the faculty of the Theological Seminary of Saint Mary's of the Lake, Chicago, as professor of ecclesiastical history and canon law. Somewhat later he gave instruction in dogmatic theology. He was pastor at Woodstock, Ill., in 1868, and the same year removed to Joliet, Ill., where he remained until 1871, when he assumed the rectorship of Saint James's Church, Chicago. In 1883 he was appointed titular Bishop of Cabasa and coadjutor with the right of succession to the See of San Francisco. The following year the Archbishop, Joseph S. Alemany, resigned, and Monsignor Riordan became Archbishop.

RIOT (OF. *riot*, *ryot*, *riote*, *riotte*, Fr. *riotte*, It. *riotta*, riot; of unknown etymology). A form of criminal offense against the public peace, consisting in the assembly of three or more persons with intent mutually to assist each other against any one who shall oppose them in the execution of some enterprise of a private nature, and afterwards actually executing the same in a violent and turbulent manner to the terror of the people, whether the act intended were itself lawful or unlawful. (Hawkins, *Pleas of the Crown*, ch. 65.) At common law the offense, unless it resulted in some more serious crime, was a misdemeanor; but in case the riot caused loss of life or serious bodily injury, the rioter might be punished for the felony committed.

If the riotous enterprise is of a public nature, in that it is directed toward the Government with the purpose of overthrowing or destroying it, the offense is treason (q.v.). The assembly need not be planned by the rioters in advance. It is enough to constitute the crime if there is the actual assembly resulting in the tumultuous execution of the private enterprise. The crime may be committed also if the rioters do not specifically

intend to terrify others, if such is the natural or necessary consequence of their riotous acts.

When there is an assembly of three or more persons for some riotous purpose under such circumstances as to give rise to a reasonable apprehension on the part of others of a breach of the peace, although no actual public disturbance does result, the offense is known as unlawful assembly. If some steps are taken toward the execution of the unlawful or riotous purpose which, however, fall short of actual public disturbance, the offense is known as a rout. Thus if these persons assemble for the purpose of assaulting another in the public street of a city, they are guilty of unlawful assembly. While on their way to the place of attack or making other active preparations for the attack they are guilty of rout, and upon the execution of their purpose by committing the public assault they are guilty of riot.

The definition of the crime and its punishment are now generally regulated by statute.

RIOT ACT. An English statute, 1 Geo. I., st. 2, c. 5 (1715), which provided that if twelve persons or more were unlawfully assembled and disturbing the peace, any sheriff, under-sheriff, justice of the peace, or mayor, might by proclamation command them to disperse, and that if they refused to obey and remained together for the space of one hour after such proclamation, all participating in the assembly were guilty of felony. The statute has not been generally reenacted in the United States, where the usual provision of the criminal law and police regulations have been found an adequate protection against rioters.

RIPARIAN RIGHTS. The legal rights of owners of land containing a watercourse or bounded by one, to its banks, bed, and waters. By the common law, in the absence of express limitations to the contrary, an owner of land immediately adjacent to a non-navigable stream owns the bed of the stream *usque ad filum*, that is, to the middle thread or centre of the stream. A riparian owner has the right to make a reasonable use of the waters of a stream adjoining his property. This right is liberally construed, but will not extend to using all the water, even though he consume it all without waste. He cannot divert the stream, or so pollute its waters as to interfere with the rights of those below him on the stream. The most effective remedy of a riparian owner where another makes an unreasonable or unlawful use of the waters of the stream is by injunction, and this gives ample opportunity for a court of equity to consider all the circumstances. See such titles as RIVERS; FILUM AQUÆ; ACCRETION; ALLUVION; WATER RIGHTS, etc.

RIPLEY. A town in Derbyshire, England, 10 miles northeast of Derby (Map: England, E 3). It has manufactures of silk and lace, and mines of coal. Population, in 1901, 10,100.

RIPLEY, ELEAZER WHEELLOCK (1782-1839). An American soldier, prominent in the War of 1812. He was born in Hanover, N. H., graduated at Dartmouth in 1800, studied and practiced law, removed to Portland, Me., was one of the representatives of the District of Maine in the General Court of Massachusetts in 1810-11, serving as Speaker in the latter year, and in 1812 was elected to the State Senate. On the outbreak of

the War of 1812 he entered the United States Army as a lieutenant, and by successive promotions became a colonel in March, 1813, a brigadier general in April, 1814, and soon afterwards, by brevet, a major general. He was wounded in the attack on York (now Toronto, Can.); led the Second Brigade of General Jacob Brown's army in the battles of Chippewa and Lundy's Lane; and after the latter battle, both Brown and Scott being wounded, he exercised the chief command. He occupied and fortified Fort Erie, distinguished himself in the defense of that fort on August 15, 1814, and on September 17th was severely wounded while leading a sortie. (See FORT ÉRIE.) He resigned from the army in 1820, removed to New Orleans, La., practiced law there, was elected to the Louisiana Legislature, and from 1835 until his death was a member of Congress.

RIPLEY, GEORGE (1802-80). An American scholar and critic, born in Greenfield, Mass. He graduated at Harvard in 1823, was an instructor there, studied theology, and was ordained in 1826. He remained in Boston until 1841, busying himself with philosophical speculations, was gradually drawn into the Transcendental circle, wrote on metaphysics and education, and endeavored to further the knowledge of Continental literatures by a series of translations. On leaving his pulpit, he became a prime mover in the socialistic experiment of Brook Farm (q.v.). When this association failed (1847) Ripley went to Flatbush, L. I., and in 1848 he settled in New York City. He was the joint editor with C. A. Dana (q.v.) of *Appleton's New American Cyclopaedia* (1857-63), and of the new edition of that work (1873-76). He also worked on the staff of *The Tribune*, chiefly as literary critic, and brought its reviews up to a high standard. His first wife died in 1861, and in 1865 he married a German of Parisian education, after which he traveled much, and became the centre of a brilliant literary circle, exerting thus the most genial and helpful influence of his life, greater in what he inspired others to do than in what he himself accomplished. The translations of *Foreign Standard Literature* (14 vols., 1838-42) were his most important publications and in their time had great influence. Consult: Frothingham, *George Ripley*, in the "American Men of Letters" (Boston, 1882); Swift, *Brook Farm* (New York, 1900), which has a bibliography; and see TRANSCENDENTALISM.

RIPLEY, HENRY JONES (1798-1875). An American Baptist divine and biblical scholar. He was born at Boston, Mass., and educated at the Boston Latin School and Harvard College. After finishing his theological course at Andover in 1819 he became an evangelist among the Southern slaves. One year excepted, he continued these labors until 1826, when he entered the faculty of the Newton Theological Seminary, as professor of biblical literature and pastoral duties. From 1860 to 1865 he was engaged in private literary work at Newton and gave instruction to freedmen preachers at Savannah, Ga. In 1866 he returned to Newton Seminary as librarian, and from 1872 to 1875 served as associate professor of biblical literature. His writings include: *A Woman of Her, Thomas S. Wom* (1824); *Christian Baptism* (1835); *Sacred Rhetoric* (1849); *Predecessors of the Baptists* (1857); *Church Polity* (1867).

RIPLEY, JAMES WOLFE (1794-1870). An American soldier, born in Windham County, Connecticut. He graduated at West Point in 1814, was commissioned second lieutenant of artillery, and was assigned to duty on the northern frontier, where he took part in the defense of Sackett's Harbor. In 1817-18 he served under Jackson during the Seminole War and the invasion of Florida, and in 1832-33 commanded the Government forces in Charleston Harbor, at the time of the Nullification movement in South Carolina. In 1832 he was promoted to be captain and in 1838 to be major of ordnance. In 1848 he was raised to the rank of brevet lieutenant-colonel. In 1854 he was transferred to the Watertown Arsenal, and in 1861, after being assigned to various other duties, he was commissioned brigadier-general and appointed chief of ordnance of the United States Army. As the Federal forces had then no heavy rifled cannon, he immediately ordered the conversion of old smooth-bores and the manufacture of Parrott guns. In 1863 he was retired from active service, and was appointed inspector of fortifications on the New England coast, a position which he continued to fill until within a year of his death. At the close of the Civil War in 1865 he was brevetted major-general in the Regular Army 'for long and faithful services.'

RIPLEY, WILLIAM ZEBINA (1867—). An American economist and sociologist, born at Medford, Mass. He studied civil engineering at the Massachusetts Institute of Technology, but then devoted himself to economics, studying that branch for two years at Columbia, where in 1893 he became lecturer in sociology. In 1895 he was named professor of economics and of sociology in the Massachusetts Institute of Technology. His publications include *A Financial History of Virginia, 1609-1776* (1893) and the Lowell Lectures, *Races of Europe* (1900). He was vice-president of the American Economic Association in 1898 and in 1900-01, and in the last year was made special agent on transportation to the United States Industrial Commission.

RIPON, rip'on. An episcopal city in the West Riding of Yorkshire, England, 22 miles northwest of York (Map: England, E 2). The market-place is spacious, and has in its centre an obelisk 90 feet high. The cathedral, the oldest part of which dates from the twelfth century, is cruciform, measures 270 by 87 feet, and is surmounted by two uniform towers, and also by a central tower. The Saxon crypt dates from the seventh century. Trinity Church is a fine cruciform edifice in early English. The principal industries are machine-making, tanning, malting, and brass and iron founding. There are also several flour-mills and varnish factories. Ripon was formerly noted for its woollen manufactures, and for the 'true steel of Ripon towels' or spurs. The place received the name of Inbrypum from a monastery established in 660; in 678 it was created a see. It suffered from the Danes, Normans, and Scots, and during the Civil War was occupied by the Parliamentarians, but was retaken by the Royalists in 1643. Population, in 1901, 8225.

RIPON, a city in Fond du Lac County, Wisconsin, 22 miles west by north of Fond du Lac, on the Chicago and Northwestern and the Chicago, Milwaukee and Saint Paul railroads. It is the

seat of Ripon College, opened in 1853, and has a public library. The centre of a productive region, Ripon has flouring mills, grain elevators, creameries, a wood-working factory, wagon and buggy works, knitting mills, pickling works, and glove and mitten manufactories. Ripon was settled in 1844 and incorporated in 1858. Population, in 1900, 3818. Consult Mapes, *History of the City of Ripon* (Milwaukee, 1873).

RIPON, FREDERICK JOHN ROBINSON, Earl of (1782-1859). An English statesman. He was born in London, the son of Baron Grantham, and was educated at Harrow and at Saint John's College, Cambridge. He became private secretary to the Lord Lieutenant of Ireland, Lord Hardwicke, and in 1806 was elected to the House of Commons. He became a Lord of Admiralty in 1810, and Privy Councillor in 1812. In the latter year he became vice-president of the Board of Trade. In 1823 he was made Chancellor of the Exchequer and in that office carried through many important financial reforms. In 1827 he was promoted to the House of Lords with the title of Viscount Goderich, and in the same year, after having been for a short time Secretary of State for the Colonies, he was called to form a Cabinet. His administration was feeble, and in June of 1828 he retired. He served in Lord Grey's Cabinet (1830-34) as Secretary of State for the Colonies, and was an advocate of the second Reform Bill. He became Lord Privy Seal in 1833 and was created Earl of Ripon. In 1834 he hastened the fall of the Cabinet by his resignation, and he continually attacked the financial policy of the Melbourne Cabinet. In 1841 he was made president of the Board of Trade and in 1843 became president of the Board of Control of Indian affairs, from which he retired in 1846.

His son, **GEORGE FREDERICK SAMUEL ROBINSON**, First Marquis of Ripon (1827—), was born in London; served in the diplomatic corps; entered the House of Commons as Viscount Goderich in 1852; became Under Secretary for War in 1859 and Secretary in 1863; was made Secretary of State for India in 1866, and was Lord President of the Council from 1868 to 1873. In 1871 he was chairman of the joint committee on the Treaty of Washington. From 1880 to 1884 he was Viceroy of India, and made himself very unpopular among the English and greatly loved by the natives because of his favoritism for things Hindu. He was Secretary for Colonies from 1892 to 1895.

RIPON COLLEGE. A coeducational, undenominational institution at Ripon, Wis., founded in 1851 as Brockway College and opened in 1853. The present name was assumed in 1863. It was founded by the Winnebago Convention of Presbyterian and Congregational Churches. This Convention relinquished control, giving it into the care of an independent board of trustees in 1868. The larger part of the institution is the college proper, in which the B. A. degree is given on completion of four years' work in any of a number of groups of studies. There is also a preparatory school and a conservatory of music and art. The college has a library of 11,000 volumes, an endowment of \$212,000, an income of \$20,000, and six buildings valued, with the grounds, at \$150,000.

RIPPERDA, rĕp-pĕr'dĕ, JOHN WILLIAM, Baron, later Duke of (1690-1737). A political

adventurer. He was born in Groningen, Holland, and at an early age entered the Dutch army. In 1715 he became Ambassador to Madrid, there he followed his friend Alberoni and turned Catholic. He was thereupon intrusted by the Spanish Government with the direction of commerce and industry, and became a favorite of King Philip V. and his consort, Elizabeth Farnese. In November, 1724, Ripperda went to Vienna and there concluded in 1725 a treaty of alliance between Spain and the Emperor Charles VI. Upon his return to Madrid in December, 1725, Ripperda was created duke and made Prime Minister. But neither Spain nor Austria was able to fulfill the terms of the treaty, and in consequence Ripperda was dismissed from office on May 14, 1726. He feared for his life and fled to the palace of Stanhope, the English Ambassador, and disclosed diplomatic secrets. The Spanish authorities thereupon seized him and confined him in the citadel of Segovia. He escaped after two years, went to Holland, and became a Protestant again. After a life of adventure in several countries, he appeared in the service of the Sultan of Morocco, and became a devout Mohammedan. He led an army against Spain, but was defeated at Ceuta in 1733, and was exiled to Tetuan, where he died. Consult: Moore, *Lives of Cardinal Alberoni and the Duke of Ripperda* (London, 1814); Syveton, *Une cour et un aventurier au XVIII^{ème} siècle; baron de Ripperda* (Paris, 1896); Philippson, *The Age of the European Balance of Power* (Eng. trans., Philadelphia, 1902).

RIPPLE MARKS. Undulatory marks seen on the sand of the seashore or on the surface of sand dunes and often on the surface of snow drifts. Similar undulations also occur on soft bottoms at a depth of many feet beneath the surface of lake or sea water. In the former cases the ripple marks are produced essentially by the action of the wind, which is thrown into an undulatory motion by the slightest obstacle; when such motions are set up, the snow or sand that is carried by the wind is deposited in such a way that the ripples reproduce the movements of the air. At the bed of an ocean or lake the movement of the water may produce ripples by a precisely analogous process. Tidal sand ripples, cloud ripples, and wind ripples are shown by photographs in *Nature* for April 25, 1901.

RIP'PON, JOHN (1751-1836). An English Baptist minister. He was born at Tiverton, became a Baptist minister in London, 1773, and so continued till his death there. He edited *The Baptist Annual Register* (1790-1802), which has numerous biographical sketches of denominational interest, and he left behind him many works which were purchased by the British Museum in 1870. His most noteworthy service was as editor of a hymn book (London, 1787; 31st ed. 1844), which was long in use and which has been pronounced one of the most important and influential ever made.

RIP VAN WINKLE. A character in one of the tales in Washington Irving's *Sketch Book* (1819), a good-natured, intemperate Dutchman, who sleeps for twenty years in the Catskill Mountains, and returning to his home finds everything changed. The first dramatized form of the story was produced in 1828, followed by many others, until in 1866 Boucicault, with sug-

gestions from Joseph Jefferson, produced the version which Jefferson made famous, first performed in London in 1865.

RISE OF THE DUTCH REPUBLIC, THE. A history of Holland by John Lothrop Motley (1806), from the abdication of Charles V., 1555, to the assassination of William of Orange in 1584. The story is told with dramatic intensity, being almost an epic with William of Orange, for whom Motley was an unqualified partisan, as hero.

RISH'ANGER, WILLIAM (c.1250 c.1312). An English chronicler, born probably in the village of Richingles in Suffolk. He joined the Benedictine monks of Saint Albans Abbey about 1271. His chronicle *Narratio de Bellis apud Lewes et Evesham*, continues the history of Matthew Paris, and gives a valuable account of the Barons' Wars from 1258 until 1267, with high praise for Simon de Montfort. It was edited by J. O. Halliwell Phillipps for the Camden Society in 1840. Other works credited to him include *Willielmi Rishanger Monachi S. Albani Chronica* (1272-1806)—the last part of which he could not have written. It was edited by Riley for the Rolls Series, in 1865.

RISHI, ri'shè; Skt. pron. r'shè (Skt. *rs.*, *scer*; connected with Av. *arshi*, uprightness). The title given to the poets of the Vedic hymns, who were supposed to have received their divine inspiration through the sense of sight. The Sanskrit texts generally give seven as the number of these sages, although the Puranas (q.v.) mention nine, and Mann (q.v.) enumerates ten. At a later period the term was applied to certain classes of ascetics. In the Hindu system of astronomy, the seven rishis form the constellation of Ursa Major.

RISING SUN, ORDER OF THE. A Japanese civil and military order with eight classes, founded by the Mikado Mutsu Hito in 1875. The decoration consists of the national emblem, a rising sun composed of 32 white rays, with a central red medallion, and is suspended by green leaves and three blossoms of the Paulownia from a white ribbon edged with red.

RISK (OF, Fr. *risque*, Sp. *riesgo*, risk; probably connected with Sp. *risco*, steep rock, Lat. *rescare*, to cut off, from *re*, back again, anew + *secare*, to cut). In insurance law, this word is used to describe (1) the obligation of an insurer; (2) the chance or hazard that the peril insured against may occur and the insurer be held liable; (3) the probable or anticipated cause from which the loss may occur and against which the insured person is indemnified; and (4) the property or person which is the subject of the insurance. See INSURANCE.

The term is also employed in connection with the law of sales, both of real and personal property, to describe the chance that the goods may be destroyed before delivery. See SALE.

RISTIC, ri'shich, JOHN (1831-99). A Serbian statesman, born in Kragujevats. He studied at Berlin, Heidelberg, and Paris, and began his official career in the Ministry of the Interior, under Prince Alexander Karageorgovitch. In 1858 he was made secretary to the embassy sent to Constantinople by Milosh Obrenovitch and became Serbian representative at the Porte (1861-67). In the latter year he was appointed Serbian

Minister of Foreign Affairs, and when Michael Obrenovitch was assassinated he was the envoy sent from the provisional Government at Belgrade to bring Prince Milan from Paris. From 1868 to 1872, during the minority of Prince Milan, he was a member of the council of regency. In 1872-73 he was Premier and Minister of Foreign Affairs. He held the same offices in 1875 and 1876-80 as leader of the Liberals in alliance with the radical Nationalists. In this capacity he guided the national policy during the wars with Turkey in 1876 and 1877-78, the ultimate result of which was that Serbia secured absolute independence and added territory. He went out of office in 1880, but remained the leader of the Liberal party in the national Parliament and was an active supporter of a Pro-Russian policy. In 1887-88 he was once more Premier. Ristic was at the head of the regency from King Milan's abdication (1889) to King Alexander's assumption of power (1893). He died in Belgrade, September 4, 1899. He was the author of several works on the foreign policy of Serbia.

RISTORI, rĕ-stô'ró, ADELAÏDE (1822—). A celebrated Italian tragic actress. She was born at Cividale, where her parents were strolling players. At the age of fourteen she was playing in *Francesca da Rimini*, and in a few years she became the leading Italian actress, a universal favorite because of her beauty and grace as well as her talents. Her marriage in 1847 with the Marquis Capranica del Grillo (who died in 1861) temporarily interrupted her dramatic career; but after two years she returned to the stage, and appeared at Rome in Alfieri's tragedy of *Myrrha*. The French attack on the city caused her for a time to desert the theatre for the hospital, where she employed herself assiduously in nursing the wounded. After having acted for several years at Rome and Turin with immense success, she presented herself before a French audience in 1855, when Rachel was in the height of her fame, a proceeding considered as a challenge by the first Italian actress to the first French actress. Even in Paris she obtained a triumph, notably in Legouvé's *Medea*, which had been rejected by Rachel. Two of her other great rôles were Schiller's Mary Stuart and Giacometti's Elizabeth. In London, in 1856, she met with great success as Lady Macbeth. She visited the United States in 1866, 1875, and 1881-85. Consult her autobiography, *Ricordi e studj artistici* (Turin, 1887; Eng. trans., *Studies and Memoirs, a Biography*, Boston, 1888); Boutet, *A Ristori* (Rome, 1899).

RITARLANDO, rĕ'târ-dân'dô. A term in music, indicating that the passage to which it applies is to be played slower and slower, with a steady retard.

RITCHIE, rĭch'ĭ, ALEXANDER HAY (1822-95). An American engraver and painter, born in Glasgow, Scotland. He was a pupil of Sir William Allen at the Royal Institution, Edinburgh, and came to the United States in 1841. He worked both as a painter and as an engraver in Canada for a short time, and then settled in New York City, where he was elected to the National Academy in 1871. His mezzotint engravings are particularly well known. They include plates after Huntington's "Lady Washington's Reception Day" and Darley's "On the March to the Sea." His oil paintings include "Merely Knock-

ing at the Gate" (1860); "Fitting Out Moses for the Fair" (1862), and several portraits.

RITCHIE, ANNA CORA MOWATT (1819-70). An American actress. She was the daughter of S. G. Ogden, of New York, but was born at Bordeaux, France. She was married at fifteen years of age to James Mowatt, a New York lawyer. After appearing in private theatricals, then in public readings, she studied for the stage and made her debut in *The Lady of Lyons* at the Park Theatre in 1845. Later she toured with E. L. Davenport in the United States and went with him to England, where she appeared in 1847 in Manchester, then in London, and became leading lady at the Marylebone Theatre, acting with him through many engagements. Her husband having died abroad, she returned to America, and in 1853 retired from the stage. In 1854 she married W. F. Ritchie, editor of the *Richmond Examiner*. He died in 1868, and she thenceforth resided in England and corresponded for American newspapers. She was the author of several plays, among them *Fashion* (produced in 1845) and *Armand* (1847), and a number of novels, of which may be mentioned *The Fortune-Teller* (1842), *Eclypsa, or a Heart Unmusqued* (1845), and *Fairy Fingers* (1865). Consult also her *Autobiography of An Actress* (Boston, 1854).

RITCHIE, ANNE ISABELLA (1838—). An English author, the eldest daughter of Thackeray. She was born in London, and was educated in Paris. She married her cousin, Richmond Ritchie, in 1877. Her works consist of novels and critical studies, written in a graceful, lucid style, which show skill in character drawing, and which are full of discriminating touches and keen observation. They include *The Story of Elizabeth* (1863), *The Village on the Cliff* (1865), and a notable edition of the works of Thackeray (1898).

RITCHIE, CHARLES THOMSON (1838—). An English statesman, born in Dundee. He became a well-known merchant in London, from 1874 to 1885 sat in Parliament for the Tower Hamlets as a Conservative, and from 1885 to 1892 for Saint George's-in-the-East. In 1885-86 he was secretary to the Admiralty, in 1886-92 president of the Local Government Board, in which capacity he accomplished important reforms in provincial administration, and in 1895-1900 was president of the Board of Trade. He became Secretary of State for the Home Department in 1900, and, in 1902, Chancellor of the Exchequer, which office he resigned in 1903. In 1895 he was elected member for Croydon.

RITCHIE, DAVID GEORGE (1853-1903). A Scotch philosopher, born at Jedburgh, and educated at Edinburgh University (1869-74) and at Balliol College, Oxford (1874-78). He was fellow of Jesus College from 1878 to 1894, being tutor at that college from 1881 and at Balliol from 1882 to 1886, and in 1894 became professor of logic and metaphysics at Saint Andrews. For the year 1898-99 he was president of the Aristotelian Society. Ritchie contributed several articles on Greek philosophy to Chambers's *Encyclopædia* and on various subjects to Palgrave's *Dictionary of Political Economy*; edited *Early Letters of Jane Welsh Carlyle* (1889); and published *Darwinism and Politics* (1889), *Principles of State Interference* (1891), *Darwin and Hegel* (1893).

Natural Rights (1895), *Political and Social Ethics* (1902), and *Plato* (1902).

RITCHIE, THOMAS (1778-1854). An American journalist, born in Essex County, Virginia. After studying medicine and doing some teaching he removed to Richmond and became editor of the *Examiner* in 1804. He changed its name to *Enquirer*, and remained its editor and proprietor till 1845, when at the request of President Polk he gave it up to his sons and removed to Washington. There he founded the *Union* as the official organ of Polk's Administration. In 1849 he retired and spent his last years in Richmond. He was a States-rights Democrat and a born editor, full of pugnacity and Scotch stubbornness. He made the *Enquirer* a power through the Union, and was himself an important figure in contemporary politics.

RITE (Lat. *ritus*, custom; connected with *riti*, way, usage, *ri*, to flow). A religious act performed according to an established order, determined by rule and usage. In established religions, worship must be carried on in a specified manner, by particular persons, and at special times and places, while its conduct requires training in the celebrant, who usually belongs to an order of priests. The hymns of the Rig Veda, as compared with Hindu faiths of subsequent ages, show incomparably greater directness and simplicity. From these and similar cases it has been inferred that acts of worship were originally not limited by prescribed form, but might take place at any time and be performed by any individual at his own pleasure. If this doctrine were accepted the history of rites would be relatively modern. Recent investigations, however, have placed a different face on the matter; in North America, at least, aboriginal worship appears to have been ritualistic to an extraordinary degree. The Navahos, for example, possess elaborate ceremonies, of which many are of nine days' duration. So complicated are these, that to become a chanter is the task of many years, and no one person can perfectly know more than one rite. These offices are performed primarily in order to heal the sick, but have also the secondary purpose of securing temporal blessings of all sorts, of bestowing amusement and social pleasure, and in general of gratifying religious emotions. Other ceremonies are efficacious in planting, harvesting, building, war, nobility, marriage, travel, and rain-bringing. In their celebration means are employed which answer to the elements of ritual in other continents, such as prayer, sacrifice, singing, dancing, incense, music, painting, procession, and casting of sacred meal. In the ordering of the service the most minute accuracy is required; for example, use is made of 'kethayns,' or plumed prayer-sticks, which are conceived as conveying messages to the gods. Each of these wands has its own special symbolism, must be offered in a particular manner, and laid in a particular direction, so as to convey its tidings to one special deity. When the bearer of the sacrifice leaves the lodge, he proceeds in a direction leading toward a selected place; after he has deposited his offering, he turns to the right and returns by a sunwise path. He must not cross the trail taken in coming, must not cross an ant-hill, and must run during the whole of his route. In the course of the ceremony songs are chanted, which are traditional, having been

handed down by word of mouth perhaps for centuries; these must be known with exactness, for any error made in singing, even to the misplacing of a single vowel, will be fatal to the efficacy of the rite. The songs are not isolated, but divided into groups, which must follow in established order, and each has a place in its own group which must not be changed, under penalty of divine displeasure, and the officiating priest is obliged to remember this place, though the series may contain some two hundred or three hundred pieces. During the function, each day and each night has its own ordained duties. Although the performances of the Navahos may excel in precision and variety, yet the same character of ritualism seems to belong to Indian tribes through North and South America. If not found among any particular race, the deficiency may be attributed either to imperfect record, or to the social conditions which have brought into abeyance an earlier ceremonial religion.

The question presents itself, how far the principles applicable to American ritual may be taken to represent general early religious custom. For the answer to this inquiry material is as yet hardly accessible. It may be admitted, however, that the evidence accessible seems to imply that the Indian ritual was typical. Among the Australians all tribes appear to have elaborate ceremonies, exhibiting many similar features. Throughout Africa full and detailed accounts have not yet been obtained representing the tribal ceremonies in which correspondence would be looked for. Early Egyptian art makes it clear that before the construction of the first pyramids there existed elaborate rites, in which stories of gods were acted out in dance, song, masquerade, and procession. Although Greek and Roman literature has failed to preserve detailed accounts of local worship, it is certain that every district and temple at one time had its own mysteries, sacred dramas, and exact observance of ceremony.

RITES, CONGREGATION OF. A committee of cardinals in the Roman Catholic Church, founded by Pope Sixtus V. (1585-1590). The number of members has varied from time to time. They are assisted by consultors and minor officials. It takes cognizance of the liturgy, the rites pertaining to the sacraments, the rubrics of the missal and breviary, the ceremonies of the Church in its public functions, such as the feasts, the due reception of exalted personages, in order to secure uniformity and reasonable consistency, and the canonization of saints. The congregation meets at the house of the prefect, who is the senior cardinal of the congregation; but it has an office, the Palazzo della Cancelleria Apostolica, Rome. Consult Baugen, *Die römische Curie* (Münster, 1854).

RITSCHL, rich'l, ALBRECHT (1822-89). A German Protestant theologian, the founder of one of the most important schools of theological thought of the present time. He was born in Berlin. His boyhood was spent in Stettin, his father having been Bishop and general superintendent of the Evangelical Church in Pomerania from 1827. He studied at Bonn, Halle, Heidelberg, and Tübingen. In 1846 he became docent at Bonn, professor extraordinary of theology in 1852, and full professor in 1859. In 1864 he was called to Göttingen, where he died.

March 20, 1889. Ritschl ranks high both as a historian and as an exegete, but he is most widely known as a theologian. His theology was of the subjective type. He was filled with a desire to know the essence of Christianity apart from what he termed its 'accidents.' Man and his spiritual needs became the centre of his system. He claimed that the first prerequisite of theological culture was a clear understanding of the Christian idea of reconciliation, and this, with the accompanying doctrine of justification, was at one time the burden of his teaching. His thought, however, may be said to have been in a state of continual flux. He passed through every stage of current religious thought, and, though widely learned, he had no sense of proportion in doctrine. Yet he furnished a rare fund of suggestion to his pupils, and, especially in his later years at Göttingen, gathered about him a circle of enthusiastic and devoted disciples. Aside from lectures, addresses, sermons, and numerous reviews, Ritschl's most important publications were: *Die Entstehung der altkatholischen Kirche* (1850; 2d ed. 1857); *Ueber das Verhältniss des Bekenntnisses zur Kirche* (1854); *Die christliche Lehre von der Rechtfertigung und der Versöhnung* (1870-74; 3d ed. 1888-89; Eng. trans. 1872-1900); *Schöberrnachers Reden über die Religion und ihre Nachwirkung auf die evangelische Kirche Deutschlands* (1874); *Unterricht in der christlichen Religion* (1875; 5th ed. 1895); *Geschichte des Pietismus* (1880-86); *Theologie und Metaphysik* (1881); *Fides Implicita* (1890). Two volumes of *Gesammelte Aufsätze* were published after his death (1893-96).

The RITSCHLIAN SCHOOL of Theology grew out of, but does not uniformly reflect, the teaching of Ritschl. Strictly speaking, it is a movement rather than a school, and it has been aptly described as an organic evolution. Its development is incomplete and there is wide divergence of views among its members. It may be described from one point of view as Christianity apart from creeds and from another as theistic altruism. Its watchwords are: "Theology without metaphysics" and "From ethics to religion." Like Ritschl, it resents the metaphysical nomenclature in which the great Christian verities have been expressed, and also claims that men should first be incited to work in the kingdom of God and thus reach out from that vantage ground to the religious thought of the kingdom. It claims that preaching should be disburdened of such doctrines as the Trinity, the Incarnation, and the Atonement, and that the gospel miracles, the resurrection of Jesus Christ, and the unpleasant fact of sin should be thrust into the background of all teaching, so as not to keep men of intelligence and culture from embracing Christianity. The tendency of the movement is away from over-defining and in favor of great liberty and elasticity of thought and expression. The Ritschlians attempt, by surrendering the supernatural element in religion, as a concession to modern critical thought, and by abandoning all discussions of metaphysical questions in theology, to save belief in Christ and in human redemption as "judgments of worth or value," which, though not actually capable of theoretic proof, are yet the very essence of religious life and knowledge. The move-

ment is widespread and influential; its disciples hold chairs in the principal German universities; the spirit of their teaching has penetrated Continental theology and made its influence felt widely in England and America.

BIBLIOGRAPHY. The life of Ritschl has been written by his son, Otto Ritschl, professor at Bonn (Freiburg, 1892-96). Works treating of his teaching and the Ritschlian school are numerous; the following may be mentioned, most of which contain extensive bibliographies: Pfeleiderer, *Die Ritschlsche Theologie kritisch beleuchtet* (Brunswick, 1891); Schoen, *Les origines historiques de la théologie de Ritschl* (Paris, 1893); Mielke, *Das System Albrecht Ritschls* (Bonn, 1894); Denny, *Studies in Theology* (London, 1894); Orr, *The Ritschlian Theology and the Evangelical Faith* (New York, 1899); Swing, *The Theology of Albrecht Ritschl, with Instruction in the Christian Religion*, translated from the 4th German edition (ib., 1901); Brown, *The Essence of Christianity* (ib., 1902); Garvie, *The Ritschlian Theology, Critical and Constructive* (ib., 1902).

RITSCHL, FRIEDRICH WILHELM (1806-76). A German philologist. He was born at Grossvargula, in Thuringia, April 6, 1806. He studied at Leipzig under Hermann, and from 1826 to 1829 at Halle. In 1833 he was called to Breslau as extraordinary professor. In 1834 he became full professor, and he spent the winter and spring of 1836-37 on a tour through Italy. In 1839 he went to Bonn as professor of classical literature and rhetoric. His first literary works were devoted to the Greek grammarians, as the edition of Thomas Magister (Halle, 1832), the treatise *De Oro et Origine* (1834), and the *Die Alexandrinischen Bibliotheken und die Sammlung der Homerischen Gedichte durch Pisistratus* (1838), prove; but by far his greatest work is his edition of Plantus (1848-53). Subsequently he devoted himself to a systematic treatment of Latin inscriptions, with the view of illustrating the history of the Latin language, and published a long series of epigraphical studies, followed in 1862 by his monumental folio *Præca Latinitatis Monumenta Epigraphica*. He died November 8, 1876. His life has been written by Ribbeek (2 vols., Leipzig, 1879-81) and Müller (Berlin 1877).

RIT'SON, JOSEPH (1752-1803). An English antiquary, born at Stockton-on-Tees. He studied law, and practiced as conveyancer. Afterwards he was appointed high bailiff of the liberty of the Savoy (1784), a position he held for life. He was a man of learning, but of peculiar disposition, and a savage critic. Warton, Johnson, Steevens, Malone, Bishop Percy, Pinkerton, and others were the subjects of his bitter pen. His works include: *Observations on Warton's Three First Volumes of the History of English Poetry* (1782); *Cursory Criticisms* (1792); *Bibliographica Poetica; a Catalogue of English Poets of the XII.-XVII. Centuries* (1802); *Ancient English Metrical Romances* (1802); and several collections and anthologies. Consult: Haslewood, *Some Account of the Life and Publications of the late Joseph Ritson, Esq.* (1824), and Nicholas, *Letters of Joseph Ritson, Esq., with a Memoir* (1833).

RIT'TENHOUSE, DAVID (1732-96). An American astronomer and maker of astronomical

instruments, born in Pennsylvania. When 12 years old, he inherited a small library containing a few works on mathematics and among them Newton's *Principia*. In 1751 he adopted clock-making as a profession. He soon established a reputation as an astronomer and instrument-maker of unusual ability, and in 1763 was engaged to determine the boundary line since known as Mason and Dixon's line, for which he used instruments of his own construction. He was subsequently called upon to settle the boundaries between New York, New Jersey, Pennsylvania, and several other States. Soon after he made two orreries, one for Princeton College and one for the University of Pennsylvania. Rittenhouse was appointed by the American Philosophical Society to observe the transit of Venus, June 3, 1769. After 1770 he lived in Philadelphia, and was a member of the convention that framed the first State Constitution. He also served as the first State Treasurer (1777-89) and director of the Philadelphia mint (1792-95). He was professor of astronomy in the University of Pennsylvania (1779-82), and was a member of many learned societies, including the American Academy of Arts and Sciences, the Royal Society of London, and the American Philosophical Society, of which he was president after Franklin's death (1791). Most of his scientific papers appeared in the *Transactions* of the American Philosophical Society. Consult the *Memoir* by William Barton (1813).

RITTER, AUGUST (1826—). A German civil engineer, born at Lüneburg, and educated at the Polytechnic Institute at Hanover, and at Göttingen. He was a practicing engineer for some time, in 1856 became teacher of mechanics and construction of machinery at Hanover, in the Polytechnic Institute, and in 1870 became professor in the School of Technology at Aix-la-Chapelle. He is best known as the author of Ritter's method of reckoning arches for bridges and roofs. He wrote *Elementary Theory and Calculation of Iron Bridges and Roofs* (German, 1863, 5th ed. 1894; Eng. by Sankey, 1879), *Lehrbuch der technischen Mechanik* (1864; 7th ed. 1896), *Lehrbuch der Ingenieur-Mechanik* (1874-76), and *Lehrbuch der analytischen Mechanik* (2d. ed. 1883).

RITTER, FRÉDÉRIC LOUIS (1834-91). A German-American composer, born in Strassburg. He studied under Moritz, Hauser, and Schletterer. In 1856 he came to the United States, resided for some years in Cincinnati, where he founded the Cecilia and Phillarmonic societies, and in 1861 removed to New York City and conducted the Sacred Harmonic and Arion societies. In 1867 he organized a musical festival, which he conducted in New York, and was soon after appointed professor of music at Vassar College, which post he held till his death. He published many songs, orchestral, church, and pianoforte music, and several musical works, including *History of Music* (1870-74), *Music in England* (1883), and *Music in America* (1883). He died in Antwerp.

RITTER, HEINRICH (1791-1869). A German historian of philosophy. He was born at Zerbst, Anhalt, November 21, 1791; studied theology and philosophy at Halle, Göttingen, and Berlin, and in 1824 was created professor extraordinarius at Berlin University. In 1833 he accepted a call

to the university at Kiel, and went thence in 1837 to Göttingen. His great work, *Geschichte der Philosophie* (Hamburg, 1829-53; 2d. ed., vol. I, iv, 1846-38), is still of value. In addition he wrote works on logic, metaphysics, and ethics. Ritter was largely influenced by Schleiermacher. He died February 3, 1869.

RITTER, HENRY (1816-53). A Canadian genre painter, born at Montreal. He studied under Gröger in Hamburg and under Karl Ferdinand Sohn at Dusseldorf. Among his characteristic and finely colored episodes from the life of sailors and fishermen, showing the influence of Rudolf Jordan, the most prominent are: "Braggart in Sailor's Tavern" (1841); "Offer of Marriage in Normandy" (1842, Leipzig Museum); "Drowned Son of the Pilot" (1844, Bayenö Gallery, Berlin); "Poncher Before Justice of the Peace" (1847), his largest painting; "Prairie Fire" (1851, Kunsthalle, Hamburg); "The Son's Last Letter" (1852, Kunsthalle, Bremen); and "Middy's Sermon" (1853, Cologne Museum).

RITTER, KARL (1779-1859). An eminent German geographer. He was born at Quedlinburg, Prussia, in 1779, and was educated in the famous school of Salzaun at Schnepfenthal and at Halle University. His earliest geographical studies were printed in a paper published for the young, and attracted wide attention. His six maps of Europe were published in 1806 and his *Geography of Europe*, in two volumes, five years later. In 1816 he completed in Berlin the first volume of *Die Erdkunde*, his monumental geographical work, and a part of it was published in the following year. The whole of the first volume did not appear until 1832, and the following volumes were issued from the press in rapid succession. *Die Erdkunde* is the fullest encyclopædia of geographical lore. In this work Ritter unfolded and established the treatment of geography, as a study and a science, which has been indorsed and adopted by all geographers. He presented the earth's surface in its relations to nature and to man and as the foundation of the study of the physical and historical sciences. All the physical geographies of to-day profoundly show the influence of Ritter's writings. His position as a teacher became as eminent as his rank as a geographer. Many of Ritter's writings were printed in the *Monatsberichte* of the Berlin Geographical Society, and in the *Zeitschrift für allgemeine Erdkunde*. His *Geschichte der Erdkunde und der Entdeckungen* (1804), *Allgemeine Erdkunde* (1862), and *Europa* (1863) were published posthumously. Some of his works have been translated into English by W. L. Gage: *Comparative Geography* (1865), and *The Comparative Geography of Palestine and the Sinaitic Peninsula* (1866). Consult the *Life* by W. L. Gage (Edinburgh, 1867) and Kramer (Halle, 1864; 2d. ed. 1875).

RITTER, PAUL (1829—). A German architectural painter and etcher, born at Nuremberg. He was deaf and dumb from the fourth year of his life. A pupil of Heidehoff, he engraved for publishers in Berlin, Stuttgart, and Nuremberg. About 1870 he took up painting in oil and acquired considerable reputation with his interior and street views of Nuremberg, richly supplemented with historical figures, such as "Interior

of Church of St. Lawrence" (1874); the "Schöne Brunnen" (1880); "Entry of Procession with the Crown Jewels into Nuremberg in 1424" (1883, City Hall, Nuremberg); "Entry of Gustavus Adolphus in 1632" (1886); "Emperor Matthias Leaving the Kaisersburg in 1612" (1890); and "Monument of Saint Sebaldus." In 1888 the title of royal professor was conferred on him. His brother LORENZ (1832—), born at Nuremberg, pupil of Heideloff, also painted (chiefly in water colors) and etched numerous architectural views in his native city and some subjects from North Italy.

RITTERSHAUS, rit'têr-shaus, EMIL (1834-97). A German lyricist, born at Barmen. His poetry, marked by simple feeling, fine diction, and original matter, won great popularity. The best known of his works are: *Gedichte* (1856; 8th ed. 1891); *Am Rhein und beim Wein* (1884; 3d ed. 1893); *Buch der Leidenschaft* (1886); and *In Brudersliebe und Brudertreue* (1893).

RITUAL (Lat. *ritualis*, relating to rites, from *ritus*, rite; connected with Skt. *riti*, course, custom, from *ri*, to flow). The name of one of the service books of the Roman Church, in which are contained the prayers and order of ceremonial employed by priests in the administration of certain of the sacraments and other offices of the Church. Substantially in its present form it dates from the Council of Trent, which directed a revision of all the different rituals then in existence.

RITUALISM. A term popularly applied to the remarkable development of Church ceremonial which grew out of the Oxford Movement (q.v.) and gathered about the service of the Holy Communion, in the Church of England. The ritualistic movement may be said to date from 1863, or even earlier. There were Church riots in East London springing from this cause in 1859. The assertion of the doctrine of the Real Presence (see LORD'S SUPPER) and its concomitant, the Eucharistic Sacrifice, resulted in a marked development of ceremonial. It is no exaggeration to say that a present-day 'high celebration' of the Holy Eucharist in an 'advanced' church is characterized by a detailed and elaborate ceremonial with which the earlier Tractarians had no acquaintance. The chief warrant for the new ritual is found in what is known as the "Ornaments Rubric" (q.v.) in the English Prayer Book. But the ritualistic, so called, find additional sanction for their ceremonial in the language of Canon XXX. of 1603, which, they assert, establishes the unity of the Church of England with other 'branches' of the Catholic Church and gives them the right to use all ceremonies which are primitive and catholic. They further contend that in the 36th article, on "The Consecration of Bishops and Ministers," it is expressly declared that the old Latin ordination services of the time of Edward VI. contain nothing 'superstitious or ungodly,' that a celebration of the Holy Communion, according to the liturgy of 1549, formed an integral part of these ordination services, and that such a celebration involved the use of all sorts of pre-Reformation rites and ceremonies—all, in fact, that are contended for by the advanced school at the present day. They also cite in support of their practices the numerous lists of ornaments found in the ancient records of parish churches in Edward VI.'s time and the

inventories taken by a commissioner appointed in 1552, which "specify a number of appliances and usages over and above those mentioned in the first Prayer Book of Edward VI." They contend, in fact, that every vestment, ornament, and movable thing used in the Church services before the Reformation and every ceremony involved in its use are now perfectly legal, unless expressly forbidden or by implication done away with by rubrical or other proper authority. The result is the complete transformation of the Church's worship as it was celebrated in the middle of the last century. The 'six points' of ritual are insisted upon. These are the Eucharistic vestments (see COSTUME, ECCLESIASTICAL); the eastward position for the celebrant at the altar; the use of unleavened or wafer bread; the mixed chalice; incense; and altar lights.

In England several attempts have been made to suppress these ritualistic practices. In 1867 the Government appointed a commission "to inquire into the rubrics, orders, and directions for the regulation of the conduct of public worship." In 1874 the Public Worship Regulation Act was passed. Its object, as expressly declared by the Prime Minister, Disraeli, was to "put down Ritualism," and its most significant provision was the appointment of a State-made judge before whom ritual cases might be brought. In 1890, before Archbishop Benson and his episcopal assessors, Bishop King of Lincoln was tried for unlawful practices in the celebration of Holy Communion. The specifications were allowing two lighted candles on the altar, mixing water with the wine, assuming the eastward position, permitting the *Agnus Dei* to be sung, making the sign of the cross at the benediction, and taking part in a ceremonial ablution of the sacred vessels. On strict legal grounds, all of these except the sign of the cross were upheld, at least with qualifications. An appeal was made to the Privy Council, which sustained the Archbishop. In 1899 the legality of the ceremonial use of lights and incense and the reservation of the Sacrament was argued before the Archbishops of Canterbury and York, and the decision was adverse to the ancient practices.

But legislation has practically failed of its object. Several English clergy went to prison rather than obey the mandates of a secular court in things spiritual. The interference of the State in the teaching and practice of the Church was resented and firmly resisted. Even the archbishops' decisions were held to be but 'opinions,' and any weight attaching to them was deemed moral rather than legal. The movement, as represented by the English Church Union, under the leadership of Lord Halifax, has gone steadily on. The advanced school has been recognized by the Government in the selection of a certain number of bishops from its ranks. The comprehensiveness of the national Church has been admitted. Most of the practices in debate have been either explicitly or tacitly recognized. The onus of the solution of the difficult problem of ritual rests largely upon the bishops, and their fatherly counsels generally result in the suppression of extreme practices.

In the American Church the absence of any connection with the State has made the history altogether different. But the advance in ritual on the one side and the opposition to it by ecclesiastical means on the other have run a similar

course. The controversy raged most hotly between 1865 and 1880, and numerous attempts were made to obtain definite legislation on the subject. In the absence of any detailed prescription in ritual matters, the advanced school contended that the law of the Church of England held good in her daughter Church. In 1871 a canon was passed by the General Convention which made it the duty of the bishops to proceed against any minister accused of introducing unauthorized ceremonies or practices setting forth erroneous or doubtful doctrines, especially the elevation or adoration of the elements in Holy Communion, and all other like acts not authorized by the rubrics of the Prayer Book. But the canon was practically a dead letter from the first, and, as in England, ritual observances which fifty years earlier would have raised a tempest of opposition are now common among the most moderate churchmen. The movement in favor of a more ceremonial conduct of divine worship has spread far beyond the limits of the Anglican Communion, and among Presbyterians (especially in Scotland), Methodists, and other Protestant bodies, there have been numerous instances of the introduction of ceremonies hitherto unheard of, all tending in the same direction. Consult: MacColl, *The Reformation Settlement* (London, 1899); several essays in Shipley, ed., *The Church and the World* (ib., 1866); Walker, *The Ritual Reason Why* (ib., 1867); Gladstone, *The Church of England and Ritualism* (ib., 1876); Parry, *Report of the Royal Commission on Ritual* (ib., 1897); Balfour, "How the Ritualists Harm the Church," in *North American Review* (New York, 1899); Barry, "What is Ritualism?" and Corrance, "The Development of Ritualism," in *Contemporary Review* (London, 1898); Galloway, *Teelee Lectures on Ritualism* (ib., 1879); Roscoe, ed., *The Bishop of Lincoln's Case* (ib., 1891).

RIVALS, THE. A comedy by Richard Brinsley Sheridan, produced January 17, 1775. On its first representations it was almost a failure, but it has since held the stage more successfully than most eighteenth-century plays. It has more action, though less brilliancy, than *The School for Scandal*. The rivals are Bob Acres and Beverly (Captain Absolute), who contend for Lydia Languish. Acres challenges Captain Absolute by Sir Lucius O'Trigger, but finding he is a friend, declines to fight. Mrs. Malaprop, with her delightful blunders, supplies a large part of the humor of the play.

RIVAS, rěväs. The capital of the Department of Rivas, Nicaragua, 50 miles southeast of Managua (Map: Central America, E 5). It is the centre of a rich cacao-producing region, and manufactures and exports chocolate. It occupies the site of the ancient Indian town of Nicrao. Population, in 1895, 12,000.

RIVAS, ANGEL PEREZ DE SAAVEDRA, Duke of (1791-1865). A Spanish soldier, statesman, and poet, born in Cordova. He entered the army in 1807, and fought through the Spanish war of independence, retiring from the service in 1815. He participated in the revolution of 1820, was Secretary of the Cortes in 1821, and was forced to leave the country in 1823, residing in England, Malta, and France. He returned to Spain in 1834, came into possession of the dual title of Rivas, and became Minister of the Interior in 1836. He was again forced into exile from 1837

to 1843. Then he was for five years Spanish Ambassador at Naples. He was afterwards Ambassador at Paris (1856), and at Florence (1860). His fame as a national poet began in 1813 with the publication of *Ensayos poéticos*. Other works of his are the epics *Florenda* (1825) and *El mono carpósto* (1834), the plays *Tanto vale cuanto tevas* (1834), *Don Álvaro* (1835), and *La marisca de Hajar* (1842), and the *Historia de la sublevación de Napóles* (1848). His *Obras completas* have been edited by his son.

RIVE, rěv, DE LA, SEE DE LA RIVI.

RIVE-DE-GIER, rěv'de zhě'zě. A town in the Department of Loire, France, on the Gier, 19 miles southwest of Lyons (Map: France, I, 6). It is in one of the best coal fields in France, and has over fifty coal mines, also iron works, glass works, and silk factories. Exports are facilitated by canal communication with Cayons, on the Rhone. Population, in 1901, 16,987.

RIVÉ- (rěvā') KING, JULIE (1859—). An American pianist born of French parents in Cincinnati. She studied under William Mason and S. B. Mills in New York, Carl Remecke in Leipzig, and Liszt in Weimar. Her debut occurred in Leipzig in 1873. The following year she returned to Cincinnati and in 1875 appeared at a Philharmonic concert in New York. She subsequently gave many concerts with the Thomas and Seidl orchestras and became well known as a brilliant concert pianist. Her compositions are for the piano, and enjoy considerable popularity.

RIVER (OF, *riviere*, Fr. *riviere*, from ML. *riparia*, shore, river, fem. sg. of Lat. *riparius*, relating to a shore, from *ripa*, shore). A natural drainage line on the land, which, in addition to carrying off the surface water, always bears a load of mineral matter in suspension and solution. The water supply is derived from the rain or melting snow and from underground, whence it reaches the surface by seepage or in the form of springs. It is this latter source of supply which causes so many rivers to maintain their flow even when no rain has recently fallen. The load of mineral matter is obtained partly by solution in the passage of the water through the soil or rock, partly by the mechanical wearing or corrosion of the stream bed, and partly by the supplies furnished by the rain-wash and weathering of the valley sides. In the course of this run-off the water forms a valley which varies in size and characteristics. Usually this valley is on the surface of the land, though occasionally beneath the surface, as in Mammoth Cave of Kentucky.

Most rivers flow from higher country into lakes, or into the sea; but in arid countries many streams terminate on the land because the river water sinks into the ground and evaporates. The Western United States offers many illustrations of these conditions. In such arid regions the large rivers that are fed by a permanent supply from the mountains are often able to maintain their course across even desert regions. The Nile of Egypt and the Colorado of Utah and Arizona are illustrations of such rivers.

From the headwaters to the mouth a river has a slope which varies from one part to another. Ordinarily the steepest slope is near the head and the most gentle near the mouth, where the stream commonly flows quietly through a flood

plain. This difference in slope is due to the fact that, in the normal development of its valley, a stream does its earliest and most effective work near the lower portion, where the volume is greatest, while the rills and creeks of the headwaters have had less time for their work. They also have less water with which to work, and, being higher, they have a greater task to perform in cutting down their slope. Hence the headwater streams may be vigorously at work excavating their valleys long after the lower course has been reduced to its *profile of equilibrium*—that is, the easiest slope down which the river water with its sediment load may pass.

The condition of the river slope, the valley form, and most of the peculiarities of rivers depend in such large measure upon the stage in development which the river has reached in its task of valley formation that it seems quite essential, in attempting to give an adequate statement of the variations in rivers, that we should first of all consider the question of river-valley development.

Let us imagine a new land for the first time exposed to the air. The rain that fell upon it would run off down the easiest slope and quickly carve a channel which would necessarily be steep-sided. Such a condition as this is illustrated in southern Florida, where the raised sea bottom is so level that the run-off is retarded and the rivers expand into many shallow lakes and swamp tracts. It is also illustrated on the coastal plains of Texas, where shallow, steep-sided valleys are cut in the soft strata of the low-lying plains.

At the same time that the river is rapidly excavating along its bed, the weather—rain, frost, etc.—is much more slowly attacking the valley walls; but so long as a stream can cut along its channel the deepening will proceed with much more rapidity than the widening. That is to say, the valley form will be that of a gorge. When, however, the stream has reached the limit of its power to cut vertically, that is when it has reached its *base level*, the slow process of broadening under the action of weathering, being in excess, reduces the slope of the valley walls. Therefore the river valley broadens out. Naturally the rate of broadening of a valley will vary according to many conditions, two of the most important of which are the nature of the rock and the climate. Many of the scenic features of river valleys depend upon the influence of rock structure in retarding or accelerating weathering. The Colorado Cañon of Utah and Arizona furnishes numerous examples of this; and it also stands as a type of the effect of climate in retarding valley development. The Colorado is topographically a young stream, but its valley is much less broad and much steeper than it would be had it been formed in a moist climate.

In the course of erosion a river excavates more rapidly in the soft than in the hard layers. It therefore locally so increases its slope as to introduce rapids or even falls in its course. The Niagara gorge and falls offer an excellent illustration of this phase. There are numerous other causes for waterfalls than this most common one; for example, the two Yellowstone falls occur where two hard vertical dikes occur in the softer, partly decomposed lava. The Yosemite falls are apparently due to excavation of the

main Yosemite valley by a glacier which passed down that valley; and in the Alps and the fiords of Norway falls of similar origin abound. Where lava flows have interfered with the stream courses waterfalls have resulted by the action of the river in excavating a new valley in the lava, as at the Shoshone Falls of Idaho and Spokane Falls of Washington.

The glacial interference with rivers is responsible also for the lakes which abound in Northern Europe and America. It is to this cause that the peculiarities of the Saint Lawrence system, by which there are alternate expansions of water and narrow river-like stretches, are due. The importance of these lake expanses of rivers is not confined to their usefulness in navigation; they also serve to regulate the flow of water. The rise of a few feet in a lake requires a long time for the corresponding discharge into the river to be completed. This checks the floods and furnishes an explanation of the fact that such a river as the main stream of the Saint Lawrence system is free from destructive floods. A lake also acts as a filter to river water, and the outflowing stream is therefore practically free from all mineral load excepting that held in solution. By this means the river has its power of excavation greatly decreased, since the tools with which it works in corrosion are rock fragments in suspension. It thus happens that the outlets of lakes are rarely deep valleys of erosion.

Ordinary rivers are subjected to variations in the depth of water and in the quantity of discharge per minute. With the rapid melting of the snow in spring, or at times of heavy rains, the volume of the river is greatly increased and its erosive power is very much greater than at ordinary times. In a large river with many branches a great rise is usually the result of the combination of marked increases in the volume of water supplied by numerous branches. At such times the river commonly rises until the channel is no longer able to hold it. Spreading out over the surrounding country, it floods the land, and, instead of a single thread of water, there may be a vast sheet miles in width, as in the case of the lower Mississippi valley. When the flood subsides a thin layer of sediment is left behind, and this, in the course of time, builds up a broad flat plain, known as the flood plain (q.v.), whose level is just below that of the level of the ordinary floods. The flood-plain soil is so fertile and productive that river flood plains are among the most densely populated parts of the earth; and for protection from the floods the people have found it necessary to build levees to confine the river to its channel. Such control of rivers cannot be made permanently successful, since the sediment that accumulates on the flood plain is then in part deposited in the channel, thus building it up. After a while, therefore, the river must leave its higher channel for the low ground to one side. It is because of the frequent changes of this sort in the Yellow River of China, accompanied by terrible destruction of life and property, that the Yellow River has been called 'China's Sorrow.' See INUNDATION.

The flood plains of rivers often merge into a delta (q.v.). In fact, some flood-plain sections, as the lower Nile, were first built as deltas. Wherever a stream carries sediment into the sea the accumulation that settles tends to produce a delta; and if the coast line remains at a

uniform level long enough, or if it is slowly rising, a delta will actually be built. But where the movement of the land is downward, or has recently been one of subsidence, deltas cannot be expected. This explains the absence of deltas in Northeastern America and Northwestern Europe, and accounts for the many bays, estuaries, and fiords; for in these sections the lowering of the land has drowned the seaward ends of the valleys and transformed them into arms of the sea. Thus the lower Hudson below Troy is for 150 miles an estuary and not a true river. The true Hudson is the portion from the Adirondaeks to Troy, and that below may be called a tidal river.

By the mineral load which rivers carry, important work is being performed. A large variety of alkalis and salts is held in solution and much of it is carried to the sea. It is the carbonate of lime obtained by the action of the water on the land that supplies the materials used by sea animals in the construction of their shells. This river load is therefore important in making possible the coral reefs of the present and the beds of limestone formed in ancient geological time. Since the river water carries small quantities of salt to the sea, and since it must be left behind when vapor rises into the air from the water surface, it seems probable that the saltiness of the sea is due to this action of rivers. The mechanical burden of the stream is partly suspended in the river water, though immense quantities are pushed along the bottom in the form of fine silt, sand, gravel, and stones, according to the velocity of the water. Some of this is temporarily lodged in the quieter portions of the stream, and, as we have seen, on the flood plains and deltas; but since it is journeying toward the sea, much of it eventually reaches that goal, and there it is accumulated, often after being worked over and distributed by waves, tides, and currents. It is from this source that the sedimentary rocks which form so large a portion of the continents were once derived by the wearing down of ancient lands, the transportation of ancient rivers, and deposition in the early seas.

From these facts it is evident that the work of rivers must be of great importance in the change of the form of the land. They are operating now and have been working through such long periods of past time that their results have been tremendous. It is estimated that 8,370,000 tons of mineral matter in solution are every year removed by running water from the surface of England and Wales. At this rate the surface of the country would be lowered one foot in 12,978 years as a result of solution alone. The Mississippi River carries in suspension or by dragging sediment to the amount of $\frac{1}{75000}$ of the total weight of the water. The river annually carries into the sea a quantity of mud which would make a prism 268 feet in height with a base of one square mile. About 150,000,000 tons of dissolved mineral matter is also annually carried into the sea through the Mississippi. See EROSTON.

In the course of this vast denudation rivers are subjected to many changes, some of them of an accidental kind, such as those described above as due to glaciation, etc., others due to their normal development. Among the latter changes the most important is that group which results from

the changes of divides. There is a battle in progress between the headwaters of opposing streams. The one that has the most rapid slope to the sea, or the greatest rainfall, or the softest rock to excavate, has an advantage over a less favorably situated opponent. It will push the divide back in consequence. Most often this is accomplished by a very slow backward eating, but occasionally a successful stream taps a large headwater of an opposing system and boldly leads it into its own drainage system. Such rivers have been called river pirates. It has apparently been by such headwater changes that the rivers which now cross the Appalachians through watergaps, like the Delaware, Susquehanna, and Potomac, have eaten their way back to the westward side of this mountain system.

BIBLIOGRAPHY. See GEOLOGY; GEOGRAPHY; PHYSGEOGRAPHY, etc.

RIVER BRETHERN. The name applied to a group of Christian bodies supposed to be of Mennonite origin. They originated in a colony of Swiss who settled near the Susquehanna River in eastern Pennsylvania in 1750. During the revival of 1779 congregations were formed among the converts, with Jacob Engle as their first pastor. In many points of their faith and practice the River Brethren resemble the Mennonites and in part also the Dunkards. They baptize by trine immersion; observe foot washing as a religious rite; use the kiss of greeting between persons of the same sex; teach non-resistance and non-conformity to the world; inculcate plainness in dress and living; abstain from political activity, although they do not neglect the regular duties of good citizens; are strict in the observance of the Sabbath; and endeavor to order their lives according to the precepts of the Bible. Three branches of the River Brethren are recognized: (1) *The Brethren in Christ*, the largest and having the most complete organization, with district conferences and a General Conference which meets annually. They are most numerous in Pennsylvania, Kansas, and Ohio;

and have churches also in Illinois, Indiana, Iowa, Michigan, New York, and Canada. According to the statistics compiled for the *Church Directory* of 1902, they have in the United States 124 ministers and 2866 communicants. The *Evangelical Visitor*, semi-monthly (Harrisburg, Pa.), is the periodical organ of this Church. The Brethren have missions in Buluwayo and the Transvaal, South Africa; the Baukuma district, Bengal, and the Poona district, India; in all of which 15 missionaries are engaged; and two missionaries at Hidalgo, Texas. (2) *The Old Order of Yorker Brethren* was constituted of churches which, on a division taking place in 1862, adhered to the original doctrine and practice. Most of these churches were in York County, Pa., whence the name 'Old Yorker.' Other churches are in Ohio, Indiana, and Iowa. (3) *The United Zion's Children* originated in a division which occurred in Dauphin County, Pa., in 1853. Retaining the old confession of the Brethren unchanged, they differ from the other branches in certain matters of administrative and formal detail. Their churches are all in the State of Pennsylvania. Their name is supposed to have been given to the River Brethren because they baptized their first converts in the Susquehanna River.

RIVER-CRAB. A crab of the genus *Thelphusa*, inhabiting fresh water, and having the carapace quadrilateral, the antennae very short. One species (*Thelphusa depressa*), the 'grancio' of the Italians, is very common in the south of Europe, around the Mediterranean Sea. Other species are common in Palestine and other warm countries.

RIVERHEAD. The county-seat of Suffolk County, N. Y., 70 miles east of New York City, on Great Peconic Bay, and on the Long Island Railroad (Map: New York, H 5). It is in an agricultural region and manufactures woolsens, paper, carriages, soap, and lumber products. Population, in 1900, 4503.

RIVER RAISIN, MASSACRE OF. See FRENCH-TOWN.

RIVERS, NAVIGABLE AND NON-NAVIGABLE. In law a distinction is made between the rights of the public in rivers which are deemed navigable and those which are deemed non-navigable. All navigable waters are subject to the public right of navigation and under certain circumstances to other valuable rights, but the public has no right in non-navigable rivers, they being generally subject to private ownership of the riparian owners. See RIPARIAN RIGHTS; WATERCOURSES.

At common law all rivers in which the tide rose and fell were deemed to be navigable, and therefore subject to the public right of navigation. Owing to the difference in physical character of the rivers in the United States from those of Great Britain, the rule of the civil law has been applied in the United States, and all rivers are deemed to be navigable which are in fact navigable and which afford a channel for valuable commerce. To constitute a river navigable in the legal sense, the commerce carried upon it must be essentially valuable in character and the river must be a natural watercourse, not one constructed by artificial means. *Public rivers* are those which are deemed to belong exclusively to the public. The rights of the public in rivers of this class are substantially the same

as the rights of the public in the sea, namely, the right of navigation, fishing, bathing, and the right to take sand and seaweed, water and ice. Within this class are comprised generally all tidal rivers, and in many States all rivers having natural capacity for navigation or flotage. As *semi-public rivers* may be classed all non-tidal rivers which are in fact navigable, which are deemed to be subject to private ownership—which ownership, however, is subject to the public easement of navigation. The riparian owners are deemed to be owners of the bed of the stream *ad filum aqua*; but their ownership is subject to the public right to navigate the river, and in some States to other similar public easements. Navigable rivers not tidal are deemed to be semi-public in Connecticut, Delaware, Georgia, Illinois, Kentucky, Massachusetts, Maryland, Montana, New Hampshire, New Jersey, New York, North Carolina, Ohio, Rhode Island, South Carolina, Vermont, and Wisconsin.

While all public rivers are subject to the right of navigation, the right extends only to the use of the rivers for purposes of navigation up to the normal high-water mark. The right to navigate does not include a public easement to use the shores of the river for towage or wharfage, although such use may be incidental to navigation. Rivers within or flowing through a State are subject to the legislative control of that State. This right, however, is subject to the power of Congress to regulate commerce, and any legislative act inconsistent with the acts of Congress for the purpose of regulating commerce is void. In case of rivers running between two States, both States have jurisdiction over them. In the United States, by the Constitution and acts of Congress, the admiralty jurisdiction of the United States District Courts extends over all navigable rivers which are used, or capable of being used, as highways of commerce and by themselves, or by connecting bodies of water, form a continuous navigable waterway between States or from a State to a foreign country. Consult: Hunt, *The Law of Boundaries and Fences* (4th ed., London, 1896); Coulson and Forbes, *The Law Relating to Waters* (2d ed., London, 1892); Gould, *The Law of Waters* (3d ed., Chicago, 1900). See ADMIRALTY; MARITIME LAW; WATERCOURSE; BRIDGES, THE LAW RELATING TO.

RIVERS. A title borne by three Englishmen prominent in the fifteenth century. RICHARD WOODVILLE, the first Earl Rivers (?—1442), was a favorite of Henry V. The King appointed him seneschal of Normandy; afterwards he was chamberlain to the Regent Bedford and lieutenant of Calais. His son RICHARD (?—1469) married Jacquetta of Luxemburg, the widowed Duchess of Bedford, about 1436. He was a famous fighter, and was created Baron Rivers in 1448. His politics were Lancastrian until 1461, when he joined the York side and acquired great influence by the marriage of his daughter Elizabeth to King Edward IV. in 1464. He was made Constable of England in 1467. In his efforts to overthrow the Nevilles of Warwick, who represented the old nobility, he and one of his sons were captured and executed at Northampton in 1469. His son ANTHONY, second Earl Rivers (c.1442-83), known as Baron Seales during his father's lifetime, shared all King Edward's diversities of fortune, and remained his trusted friend after his return to power. At the

King's death. Gloucester, afterwards Richard III., became Protector of the kingdom. Actuated by desire to get possession of the person of the young King Edward V., Gloucester arrested Rivers, who was governor of the prince, and he was beheaded on a charge of treasonable designs.

RIVERSIDE. The county-seat of Riverside County, Cal., 65 miles east by south of Los Angeles; on the Santa Ana River, and on the Southern Pacific, the Atchison, Topeka and Santa Fe and the San Pedro, Los Angeles and Salt Lake railroads (Map: California, E 5). It is noted for its beautiful streets and surroundings. Magnolia and Victoria avenues in particular are lined with magnificent shade trees and extend for several miles through orange groves. The city has a handsome court house and a public library. Riverside is the centre of one of the richest orange-growing sections in the world, and lemons also are extensively cultivated. The first settlement was made in 1870 and the city was incorporated in 1883. Population, in 1900, 7,973.

RIVES, RĒV, ALFRED LONDON (1830-1903). An American engineer, son of William Cabell Rives, United States Minister to France, born in Paris. He studied at the Virginia Military Institute and the University of Virginia, and in 1854 graduated at the Paris Ecole des Ponts et Chaussées. He was assistant engineer on the Capitol building in Washington, worked on the Washington aqueduct and on governmental improvements of the Potomac River, and in the Civil War became colonel of engineers in the Confederate army. Then he became an engineer of the Chesapeake and Ohio Railroad, vice-president and general manager of the Mobile and Ohio Railroad, and afterwards of the Richmond and Danville Railroad, and, after acting as superintendent of the Panama Railroad, was chief engineer of the Cape Cod Canal. His daughter is the Princess Troubetzkoy (Amélie Rives).

RIVES, AMÉLIE, Princess Troubetzkoy (1863—). An American author, born in Richmond, Va. She early began to write stories, some of which were published in the *Atlantic Monthly*. Her first collection of tales, published in 1888, was called *A Brother to Dragons, and Other Old-Time Stories*. This was followed by *Virginia of Virginia* (1888), and *The Witness of the Sun* (1889). In 1889 she created a marked sensation by *The Quick or the Dead*, and in the same year published *Herod and Mariamne, a Drama*, in verse. Among her later works are: *According to St. John* (1891), a novel; *Barbara Dering* (1892); *Athelwold* (1893); and *Tanis, The Sand-Digger* (1893). In 1888 Miss Rives married John Armstrong Chanler of New York, from whom she was subsequently divorced. She then became the wife of Prince Pierre Troubetzkoy of Russia, and lives in Virginia.

RIVES, WILLIAM CABELL (1793-1868). An American political leader and diplomat, born in Nelson County, Va. He was educated at Hampden-Sidney and William and Mary colleges, and was admitted to the bar. He early became one of the prominent Democrats of Virginia, was a member of the State Constitutional Convention in 1816, of the State Legislature in 1817-19 and in 1822, and of Congress from 1823 to 1829. He was Minister to France from 1829 to 1832, when he was elected to the United States Senate, from which he resigned in 1834. He was re-elected

in 1835, and remained in the Senate until 1845. He was again Minister to France from 1849 to 1853, and was a member of the Peace Conference at Washington in 1861, and afterwards of the Confederate Provisional Congress, and of the first and second regular Confederate Congresses. He published an excellent *History of the Life and Times of James Madison* (3 vols., 1859-68); *The Life and Character of John Hampton* (1845); and *Ethics of Christianity* (1855).

RIVET (OE. *riwet*, *riwet*, from OE. Fr. *river*, to clench, from Icel. *rifa*, to stitch together). A metal pin for connecting two plates of metal in boiler and tank making, iron shipbuilding, and steel bridge and structural work. To use the rivet it is heated, inserted in the punch or drill holes of the two plates, and the projecting unheaded end hammered to a hemispherical head. The heading process may be performed by hand or by pneumatic percussive riveting machines, or by squeezing the rivets between the dies of pneumatic, steam, or hydraulic riveting machines. (See METAL-WORKING MACHINERY and PNEUMATIC TOOLS.) Small steel rivets are often headed when cold, and copper rivets and rivets of the other soft metals are never heated.

RIVETING MACHINES. See METAL-WORKING MACHINERY.

RIVIERA, rĒ-vĕ-ā-rā. The popular designation of the narrow but beautiful coast line of Italy and France, mainly around the Gulf of Genoa. The eastern half of the Riviera—Riviera di Levante—extends from Spezia to Genoa; the western half—Riviera di Ponente—from Genoa to Nice in France, or as far as Hyères. The Riviera is distinguished by its magnificent scenery, and by its mild climate, which each winter attracts thousands of sojourners of all classes, more especially to the numerous famous resorts along the western coast—Cannes, Nice, Mentone, Monte Carlo, San Remo, etc. The scenery is rather more bold and wildly picturesque on the east coast, and the vegetation is not so rich and attractive there as along the Ponente. Along the western Riviera from Nice to Genoa winds the celebrated Corniche road. The Riviera is occasionally visited by earthquakes, the last having been in 1887. Consult: Lenthéric, *The Riviera, Ancient and Modern* (trans., London, 1895); Hare, *The Riviéras* (ib., 1897); Hörstel, "Die Riviera," in *Land und Leute*, vol. xi. (Bielefeld, 1902); Macmillan, *The Riviera* (London, 1886).

RIVIÈRE, rĒ-vyā-r', BRITON (1840—). An English animal and figure painter, born in London. He was the son and pupil of William Rivière (1806-76), one of the family of artists who taught drawing at Cheltenham and Oxford. Young Rivière first exhibited at the Academy in 1858, and his early work was influenced by the Pre-Raphaelites. Afterwards he graduated at Oxford (1867). He was elected a member of the Royal Academy in 1881. The combined animal and figure subjects of Rivière attracted attention, but his "Circé" (1871) and "Daniel" (1872) were the first of his notable large paintings. These were followed by "Persepolis" (1878, his masterpiece), "In Mamis Tuas Domme" (1879), "A Mighty Hunter Before the Lord" (1891), "Beyond Man's Footsteps" (1894, in the National Gallery), and "To the Hills" (1901).

He has been called the greatest English animal painter since Landseer.

RIVIÈRE DU LOUP, rîvyâr' dy lû (EN BAS). A town in Canada. See FRASERVILLE.

RIVIÈRE DU LOUP (EN HAUT). A town in Canada. See LOUSEVILLE.

RIVIÈRES DU SUD, dy sùd. A French colonial possession in Africa. See FRENCH GUINEA.

RIVINGTON, JAMES (c.1724-1802). A noted Tory journalist of New York in the Revolution. Rivington early acquired wealth as a bookseller in his birthplace, London, lost it at Newmarket, emigrated to Philadelphia (1760), and thence to New York (1761), where he had a bookshop in Wall Street. In 1773 he began to publish *The New York Gazetteer, or the Connecticut, New Jersey, Hudson River, and Quebec Weekly Advertiser*, bitterly attacking the Revolutionary movement and its leaders till Captain Isaac Sears, of the Sons of Liberty, came (1775) from Connecticut to New York with 75 horsemen, destroyed Rivington's press, and cast his type into bullets. After a Congressional investigation Rivington was permitted to return to his house, but he thought it wise to visit England, where he was appointed King's printer for New York, and returned thither in 1777 to publish *Rivington's New York Loyal Gazette*, a title presently changed to *Royal Gazette*. About 1781 Rivington turned spy for Washington, and on the evacuation of New York changed the title of his paper to *Rivington's New York Gazette and Universal Advertiser*, but he had lost public confidence. His paper ceased to exist in 1783 and his declining years were passed in obscure poverty.

RIVOLI, rîvô-lé. A village in Italy, in the Province of Verona, on the river Etsch, 13 miles northwest of Verona, noted as the scene of a victory gained by Napoleon over the Austrians under Alvinczy, January 14-15, 1797. His services in the battle gave Massena (q.v.) the title of Duke of Rivoli (1807).

RIVOLI, rîvô-lé', RUE DE. One of the most noted streets of Paris, running from the Place de la Concorde to the Rue Saint Antoine. The western end of the street contains many of the most attractive shops of the city, and is lined on the north side with arcades for several blocks, facing the Louvre and the Tuileries Gardens. It was begun in 1802, was completed in 1865 at a large cost, and received its name in honor of Napoleon's victory at Rivoli in 1797.

RIX, JULIAN WALBRIDGE (1850—). An American landscape painter, born at Peacham, Vt. He began to paint landscapes in 1875, and was self-taught, studying directly from nature. His subjects are chosen from all parts of America and his treatment has in every case been remarkable for variety. No two paintings from his brush represent the same viewpoint, and he is noticeably free from mannerism. One of his most characteristic pictures is "St. John Harbor" (1903), a marine, which shows fine cloud and sky effects. Other works, all in private collections in Baltimore, New York, Rochester, and South Bethlehem, Pa., include, "Sunset, California Coast," "High Tide, Coast of Maine," "The Woodland Spring, Mike Marr's Camp, Moosehead, Maine," "Breezy Afternoon," "Solitude," "Old

Oaks," "Twin Oaks," "Noonday," and "A Breezy Day."

RIYAD, rî-âd'. A town of Arabia. See RIAD.

RIZAL, rî-thâl'. A province of Central Luzon, Philippine Islands (Map: Luzon, F 8). It was formed in 1901 by the consolidation of the former provinces of Manila and Mórong (the city of Manila being excluded as a separate municipality), and lies north of Laguna de Bay and east of Manila Bay. Its area is 1048 square miles. The northern part is mountainous and covered with forests; the southern portions are low and alluvial, and subject to destructive floods from the Laguna. The province is traversed by the Pásig River. The chief agricultural product is the betel, but rice, sugar, corn, and tobacco are also raised. The estimated population in 1901 was 246,940, almost wholly Tagalog. The capital is Pásig (q.v.).

RIZAL, José (1861-96). A Filipino patriot and writer. He was born at the pueblo of Calamba, Province of Laguna, Luzon, of Tagalog parentage; studied under the Jesuits at Manila; went to Madrid in 1882 for the purpose of studying medicine; received the degree of doctor of medicine and philosophy at the university there, and subsequently studied in Paris, Heidelberg, Leipzig, and Berlin, devoting his attention particularly to surgery, ethnology, linguistics, and philology. He acquired a more or less extensive knowledge of seven languages, became markedly proficient in optical surgery, and made a careful study of the history, institutions, and customs of various European countries. He early came to realize the disadvantages under which his race labored in the Philippines and the oppression to which it was subjected, and in 1886 published, in Spanish, a novel, *Noli me Tangere*, in which he exposed and denounced the Spanish administration of the islands and in particular gave a startling picture of the alleged bigotry, rapacity, and cruelty of the religious Orders. This book aroused the animosity of the Spanish officials, by whom Rizal was virtually forced to leave the islands within a few months after his return in 1887. Rizal then spent some time in Japan, London, and on the Continent of Europe, and in 1891 published *El filibusterismo*, a sequel to *Noli me Tangere*. Besides endeavoring to further the cause of his people by his writings, he was instrumental in organizing the "Liga Filipina," which has for its object the expulsion of the friars, the securing of the liberty of association and of the liberty of the press, and the obtaining of political concessions similar to those which have been granted to Cuba. The Government in Luzon had rigidly prohibited the circulation of any of Rizal's writings, but in 1892 he ventured to return to Manila under a virtual promise from the Governor-General that he should be allowed to live there in safety. Upon his arrival, however, he was almost immediately arrested, was nominally convicted of having helped to organize the secret and revolutionary society known as the Katipunan, and was banished to Dapitan, Mindanao. In 1896 he volunteered to act as a physician in Cuba, where a violent epidemic of yellow fever was raging; but was seized while on his way, was brought back to Manila, and there, after a mock trial, was shot, December 30, 1896, as a traitor. His in-

fluence among the Filipinos was enormous, and his abilities were such that he has been ranked by some writers as, in many respects, perhaps the ablest man the Malay race has produced. The novel *Noli me Tangere* was translated into English by Gannett as *Friars and Filipinos* and published in New York in 1900. Consult: Blumentritt, *Biography of Dr. José Rizal* (Eng. translation, Singapore, 1898); Clifford, "The Story of José Rizal, the Filipino," in *Blackwood's Magazine*, vol. cxxxii, (Edinburgh, 1902); and, for an attempted justification of the Spanish officials, *La masonización de Filipinas: Rizal y su obra* (Barcelona, 1897).

RIZÄUS, rê-tsä'us. The real name of the Dutch theologian usually called Albert Hardenberg (q.v.).

RIZEH, rê-zé'. A port in the Vilayet of Trebizond, Asiatic Turkey, situated 40 miles east of Trebizond (Map: Turkey in Asia, J 2). It is now known chiefly for its healthful climate and picturesque surroundings, which make it popular as a summer resort. It manufactures scarfs and linen cloths. Population, about 2500.

RIZZI, rét'sé, ANTONIO (c.1430-c.1497). An Italian sculptor, born in Verona. He was probably the son and pupil of Pietro Rizzi, with whom he worked on the monument of the Doge Francesco Foscari (1457) in the Church of the Frari, Venice. The statues of Adam and Eve (c.1471) on the grand stairway of the Doge's palace are remarkable for their lifelike attitudes. Rizzi was plainly influenced by the Renaissance movement in his great monument to the Doge Niccolò Tron (1479-76) in the Frari, an elaborate work with many life-size figures, medallions, and reliefs. Rizzi was the engineer of the Republic in the war against the Turks (1483-1490) and was afterwards principal architect, and rebuilt a portion of the Doge's palace which had been destroyed by fire.

RIZZIO, rét'sé-ò, or **RICCIO**, DAVID (c.1533-66). A favorite of Mary Stuart, Queen of Scots. He was born near Turin, Italy, and came to Scotland in an embassy sent by the Duke of Savoy. As he possessed a good voice, the Queen selected him for the quartet in her private chapel. He rapidly rose in favor, and in time became her secretary and chief counselor, but there is no proof that his relations with Mary were ever of a criminal nature or that he was a Papal agent. Rizzio's haughty demeanour aroused the nobles and they made use of the jealousy of Darnley, Mary's husband, to form a conspiracy for the purpose of killing the hated foreigner. The moving spirit of the affair was probably William Maitland of Lethington, whom Rizzio had practically superseded as Secretary of State in 1565. The Protestant leaders were also glad to get rid of the Catholic favorite. On Saturday evening, March 9, 1566, the conspirators broke into Mary's chamber in Holyrood Palace, Edinburgh, dragged out Rizzio, and murdered him. The Queen afterwards, when she regained power, caused Rizzio to be buried with great honors. Consult Ruthven, *Narrative of Riccio's Murder* (Edinburgh, 1836). See MARY STUART.

ROACH (OF. *roche*, *rosse*, Fr. *roche*, from MDutch *roch*, LGer. *ruche*, Ger. *Roche*, AS. *roohc*, Lat. *raja*, roach, ray). A small cyprinoid

fish (*A. rosea*, *radula*) plentiful in the lakes and streams of Northern Europe, and similar to the bream (q.v.). It may exceed a foot in length. The upper parts are clear green, with blue reflections, the lower parts silvery white, and the fins reddish. It often gathers into large schools and is an angler's fish, but not much esteemed for the table. An American minnow, the golden shiner (*Acanis chrysolaemus*), is sometimes called roach. See PLATE OF DACE AND MINNOWS.

ROACH, JOHN (1815-87). An American shipbuilder, born at Mitchelltown, County Cork, Ireland. When fourteen years of age, he emigrated to America. After working in the Howell Iron Works in New Jersey, he, with two fellow workmen, established a foundry near New York. Soon afterwards he bought out his partners, and in 1868 bought the Morgan Iron Works. Four years later he bought the Rainer shipyards at Chester, Pa., and soon became known as one of the foremost of American shipbuilders. Among the 114 iron ships constructed at his yards were several war vessels, including the *Chicago*, the *Atlanta*, the *Boston*, and the *Dolphin*. The rejection of this last vessel by the Government in 1885 led him to make an assignment. The shipyards were soon reopened, however, under the management of his son, John B. Roach.

ROAD (AS. *rād*, from *ridan*, OHG. *ritan*, Ger. *riten*, to ride; connected with OIr. *rad*, ride, Gall. *roda*, wagon). A way of communication by land between two or more points, generally for vehicular traffic. Roads have developed with commerce and travel, and particularly with war, conquest, and military control of distant countries. Strabo mentions three great high ways running out from ancient Babylon. The earliest systematic roadmaking is credited to the Carthaginians, but the great roadbuilders of olden times were the Romans. The Appian Way (q.v.), begun by Appius Claudius, b.c. 312, appears to have been the earliest notable piece of permanent road work. In general Roman roads were built in straight lines, regardless of ordinary grades, and were paved to a great depth, the several layers of stone and concrete sometimes aggregating three feet in thickness.

One of the earliest English road laws was passed by Parliament in 1285. It directed that all trees and shrubs be cut down to the distance of 200 feet on either side of roads between market towns, to prevent the concealment of robbers in them. The first toll for the repair of roads was levied by the authority of Edward III., in 1346, on roads which now form part of the streets of London. In 1555 an act was passed requiring each parish to select two surveyors of highways to keep them in repair by compulsory labor; at a later period, in place of the compulsory labor, the 'statute labor tax' was substituted.

In France, Louis XII. ordered an inspection of and report on the roads of the kingdom in 1508, while late in the same century Henry IV. appointed the 'Great Waywarden of France'. In 1556 a stone road 15 feet wide was built from Paris to Orleans, with about 20 feet of unpaved public way on each side. France appears to have been the leader in modern road construction, but it was soon surpassed by England, and gave up its own for the English macadam system of road improvements. By 1775 Tresaguet had ordered

a system of improved road construction in many respects similar to that now widely used throughout the world. First of all, Tresaguet prepared a curved bed, or earth foundation, for his stonework, parallel with and about 10 inches below the finished surface of the proposed roadway. Instead of laying his large stones flat he set them on edge, broke their upper edges off to an even surface, then covered this stone foundation with another hand-laid course of stone, smaller than the first, and with its edges also hammered off. Finally, he put on a third layer of stones, broken to about the size of an English walnut, and spread by a shovel. The hardest stone was chosen for the surface layer. This general system was continued in France until 1820. In that year the plan worked out by Macadam in England was introduced in France, and in 1830 it was officially adopted in the latter country. It involved comparatively little change except in the foundation, as will be seen from the description of Macadam's work, further on.

Macadam and Telford (qq.v.), whose names have been applied to the two rival systems of broken-

els. Telford retained the single course of large stone on edge, introduced in France by Tresaguet, but he placed them on the bed of a level trench, and secured a curved surface to his roadway by using larger, or taller, stones at the centre than at the sides. Over these large stones, in some cases, he spread a layer of gravel 1 inch deep; then he finished the roadway with about 6 inches of broken stone. Macadam used nothing but broken stone from the finished surface of the earth foundation, at the same time raising the stone bed above the earth at each side, instead of sinking it in a trench. The latter change was designed to facilitate drainage. Macadam's entire system was founded on perfect drainage and on the thorough compacting of the angular fragments of broken stone into one solid mass. See ROAD AND STREET MACHINERY.

Prior to 1800 there were few roads in the United States that deserved to be characterized as improved. In 1796 Francis Baily, in his *Journal of a Tour in Unsettled Parts of North America*, wrote that "there is at present but one turnpike road on the continent, which is between Lancaster and Philadelphia, a distance of sixty-six miles, and is a masterpiece of its kind; it is paved with stone the whole way, and overlaid with gravel, so that it is never obstructed during the most severe season." The road was built by a company, chartered in 1792. At the start it consisted of boulders rolled in helter-skelter and filled between and above with earth and gravel. Heavy rains reduced the road to a dangerous condition. It is said that the road was afterwards macadamized. This was only one of many toll roads, distributed over the United States, but it is doubtful whether any of the other early ones could lay claim to having been macadamized. Another toll road, built in whole or in part before 1800, extended from the Shenandoah Valley, in Virginia, westward to Kentucky. It was built, and as late as 1895 it was said still to be owned by the Wilderness Turnpike Company. Although many attempts were made to secure road construction by the National Government in the early days of the Constitution, the only such work of importance, if not the sole example, was the National Road (see CUMBERLAND ROAD) from Cumberland, Md., westerly 800 miles to Vandalia, Ill. The original plan was to build a road from the Atlantic coast to the Ohio River. The road had a total width of 80 feet, and was macadamized to a width of 30 feet. As settlement proceeded, *corduroy*, or log-surfaced roads, were built across dangerously wet and soft stretches, and with the advent of the saw mill, *plank roads*, particularly for the toll ways, became common in some sections. When new, or when kept in good repair, plank roads were a vast improvement, but they were expensive to maintain and liable to get badly out of order.

After the wave of internal improvements had swept over the various States of the Union, or from, say, 1835-40, on, road construction generally became a purely local matter, except where turnpike companies built long stretches of toll roads. The advent of railways rapidly lessened the demand for extensive single lines of highways. "Working out the road tax," instead of paying the tax in money and having the money laid out by experienced road-builders, was the rule, and poor roads were the result. The rapid

THE DEVELOPMENT OF BROKEN STONE ROADWAYS.

stone road construction now practiced for nearly a century, were both Scotchmen, born within a year of each other (1756 and 1757, respectively). Although both of these great engineers built hundreds of miles of broken-stone road construction on modifications of the French plans already described, Macadam departed further from his mod-

increase in urban population, in general prosperity, and in municipal improvements, which followed the Civil War, was largely responsible for the beginning of improved city streets. These led to better roads, and from better roads it was only a step to the agitation for good roads that assumed such great proportions in the United States from about 1890 onward. This, in turn, was largely due to the widespread use of the bicycle. Prior to the general movements for good roads some towns in Essex County, N. J., began to improve their streets. In 1868 Orange, N. J., laid a 16-inch Telford road and in 1871 Essex County, in which Orange is situated, began the construction of an improved system of country roads.

ROAD LAWS—DEVELOPMENT OF GOOD ROADS. In 1889 a general county road law was passed by the New Jersey Legislature. This permitted counties, after certain legal formalities, to issue bonds for broken stone or hard road construction and to assess one-third of the cost upon property abutting on the line of the road. In 1891 New Jersey passed a State Aid or State Highway law, which was the beginning of systematic road improvement in the United States under the direction of State officials and with the aid of State funds. The law being defective, it was reënacted in 1892, and on December 27 of that year the State of New Jersey paid \$20,662 to Middlesex County to help meet the cost of 10.55 miles of broken-stone roads. This was the first money paid by the State under the amended act, and the first direct State aid to the good roads movement. Most of this work was done in the vicinity of New Brunswick and Plainfield. At first the commonwealth was represented by the president of the State Board of Agriculture, but after May, 1894, the work was entrusted to an official known as the State Commissioner of Public Roads. Under the act the cost of road construction is divided as follows: The State pays 33.3 per cent., abutting property-owners 10 per cent., and the counties in which the improvements are located pay the remainder. The initiative rests with the owners of property abutting on the road in question, two-thirds of whom must petition the County Freeholders for the improvement. That body carries out the work, under the direction of the County Engineer and subject to the approval of the State Commission. In 1899 the act was amended so that petitions may be filed with and work done by townships, as well as by counties. To the close of October 31, 1900, the total mileage of roads built under the New Jersey State Aid Law was 532 and the State's contribution (one-third of the total cost) had been \$865,319, or about \$1600 per mile. The State appropriations have ranged from \$75,000 to \$150,000 a year—in 1899. Some of the money was spent for general roads, but most of it was put into broken-stone roads.

The example set by New Jersey has been followed by several other States, notably Massachusetts. In fact, Massachusetts is now in many respects the leader in the movement for highway improvements under intelligent State direction, aided by State funds. Its Legislature appointed a committee to investigate the subject in 1892, or the next year after the first New Jersey State Road Act, and in 1893 it established a State Highway Commission of three members. Appro-

priations for actual construction were not made until 1894. To the close of 1900 a total of 296 miles of State highways had been improved under the Massachusetts Act of 1893, and the State had appropriated more than \$3,500,000 for the work. Of this sum one-fourth was to be repaid to the State, with interest at 3 per cent., and within at least six years. The counties were to collect the one-fourth by taxation. In 1900 Massachusetts appropriated \$500,000 for State roads, one-fourth to be repaid to it eventually, and in addition it provided \$6,000 for the salaries of the three commissioners, \$17,000 for engineers and clerks, and \$5,440 for traveling expenses and incidentals, making a total of \$28,500 for salaries, engineering, and the like, besides the \$500,000 for construction. In 1899 it appropriated a like sum and in 1898 had the amount, making \$71,300 in addition to the \$3,500,000 already named. Prior to the special appropriations the various expenses of the commission came out of the construction fund. The popularity of the plan in Massachusetts is shown by the fact that to the close of 1900 274 towns and 25 cities had petitioned for a total of 1,334 miles of improved roads, or more than four times as much as the commission had been able to build. Beginning with 1900 the cost of repairs, up to \$50 a mile in each year, is to be assessed on the towns in which the road is located. The Massachusetts Legislature of 1900 made provision for an expenditure of 5 per cent. of its total appropriation, or \$20,000 in that year, for grading and minor improvements in small towns which had not yet received State aid. During the year 1900 the average cost of a standard mile of macadamized road was \$8,957. This is for a width of 15 feet of stone, a depth generally of 6 inches, and a shoulder 3 feet wide on each side. It also includes painted guard rails at all steep embankments, and culverts of masonry, iron, or vitrified clay, wherever needed. It should be understood that the improvements are all on existing roads and do not include acquiring land or laying out and grading new roadways.

Rhode Island, Connecticut, and New York have also tried the State road aid plan. Rhode Island repealed its law in 1899. In Connecticut the work began in 1895 and has been growing in popularity ever since. In 1895-96 the expense of improving roads was divided equally between the State and the counties and towns in which the roads were located. In 1897-98 it was divided equally between the State and the various towns. In 1899-1900 the small towns paid one-fourth and the large towns one-third the cost, the State paying the rest. The dividing line between large and small towns is an assessed valuation of \$1,000,000. From 1895 to 1900 State aid was given in 159 of the 168 towns of the State, and in 1900 there were applications from 153 towns. The total amount available to the close of 1900, including State and local funds, had been \$1,317,550. Connecticut appropriations may be expended, in part, for grading and improving dirt roads.

New York adopted the State aid plan in 1898, but was sparing in its appropriations, and contributed only \$250,000 from 1898 to 1900, inclusive. The State pays one-half the cost of road improvements, the rest being divided be-

in the county in which the road is located and the abutting property-owners. In case the latter petition for the improvement, they pay 75 per cent. of the total cost; otherwise, only 25 per cent. In 1900 an act was passed requiring towns to keep the State roads in repair, under the direction of the State Engineer. That official passes on all applications for State aid and is in charge of the work. To the close of 1900 New York had built 53½ miles of State road, and surveys and estimates for 404 miles were under way. The State Engineer is empowered to build telford, macadam, gravel, or other kinds of roads.

Vermont appointed a State Highway Commission of three members in 1894, reappointed it in 1896, and in December, 1898, created the office of State Highway Commissioner. The commission of 1892-96 seems to have had no powers or duties save of investigation and advice, but it did some educational work and issued two reports. The Commissioner under the law of 1898 supervises the expenditure of the State road tax and is empowered to provide experts to give instruction in road-making. Other States than those named have made more or less extended inquiries relating to aid in road construction. The work is largely educational, since a vast expenditure would be required to macadamize all the roads of even the smaller States. The plan generally pursued is to improve either highways between important towns, or notoriously bad pieces of road. Often the two are combined.

In mentioning educational work, the Road Inquiry Division of the United States Department of Agriculture should not be overlooked. For several years past much has been done at Washington to collect and disseminate information relating to the benefits of good roads and how they may be best and most cheaply built and maintained. Numerous bulletins on the subject have been issued, and sample stretches of improved roads have been built in different sections, notably in conjunction with the State agricultural experiment stations.

The essentials of good roads are: (1) Proper location; (2) easy grades; (3) a smooth, hard, durable wearing surface. In the case of new roads there is little or no excuse for poor location, and no danger of it if the advice of a good road engineer is sought and followed. Ideal grades should not exceed a rise of 1 foot in 33½ of horizontal distance, which is known as a 3 per cent. grade. Telford allowed a rise of 1 in 30, and French engineers permit 1 in 20, but this is for smooth broken-stone roads.

The only classes of wearing surface for improved roads considered in this article are gravel and macadam. (For wood, brick, and stone block and sheet and block asphalt, see PAVEMENT.) Gravel, spread in layers and well rolled, makes a very good road surface, but one that is rather expensive to maintain. Gravel should be screened to free it from earth and to sort out for use the stones ranging from about ¾ to 1½ inches in diameter. The stones should be as angular as possible. A mixture of iron-bearing clay is desirable to bind the gravel together. Smooth beach or river gravel should be avoided, but some or all of it may be crushed and used where nothing else can be found. The lines between the macadam and telford roads are not

drawn so hard and fast as they once were. The tendency seems to be to use telford, or a foundation of large stone, where the ground is yielding or the traffic very heavy. The stones are placed by hand, as close together as may be. The projections above the desired depth are broken off with hammers, after which two or more layers of broken stone are spread and rolled, each separately. Whatever the number of layers, the top one is composed of fine screenings, both to fill the interstices in the layer below and to give a smooth surface. The proper sizes for broken stone, and whether or not clay, loamy earth, sand, or some other material to fill the spaces between the stone and help to bind the stone together, should be used is a mooted question. There is much to be said in favor of having the fragments as homogeneous as possible, both in size and hardness, and relying upon the roller so to pack the stone as to leave no voids. Such voids as would be thus left might well be filled as completely as possible with some material. There are obvious advantages in having this done by the smaller sizes of broken stone. Some authorities strongly advocate fine gravel and sand for filling the interstices. Careful sprinkling of the upper layer of stone is essential, but if too much water is used it will penetrate to and soften the earth beneath, thus causing settlement in spots and an irregular surface. The Massachusetts Highway Commission uses screens of 1½, 1½, and 2½ inches. Stones between 2½ and 1½ inches in size are placed at the bottom; those between 1½ and 1½ inch come next; and the screenings last. Each of the three layers is rolled separately and the last is sprinkled before it is rolled. The best material for broken-stone road surfaces in America is generally considered to be basaltic or trap rock. Some limestones serve the purpose well. Carefully selected field stones, if of a kind that will break into angular pieces, often give good results. In general, any stone used for macadam or telford roads should be tough, fine-grained, and not readily acted upon by acids or the weather.

Good drainage is an essential of all road and street construction. Water falling on the surface is removed by giving the road a proper inclination, both longitudinally and transversely, and conveying it to natural watercourses. Culverts of masonry, vitrified clay, or iron pipe are employed where open channels are impracticable, both to carry the water from the road surface and for natural watercourses beneath the roadway. Where roads pass through wet land, underdrains are necessary to keep the earth dry beneath the road surface. These, also, may be of stone or some kind of pipe, placed in the middle of the road, at the side, or running from the centre to one or both sides, according to local conditions.

Maintenance of roads is no less important than their construction, but this fact is yet to be learned in most parts of America. American engineers know how to build good roads, but can rarely secure the money necessary to maintain them, although money so spent is saved in the end. There are two methods of maintaining broken-stone roads—the constant and the intermittent road-repair system. In the former the roads are divided into sections, each in charge of one or more men. Broken stone is

provided at convenient intervals of space and applied to ruts and depressions as rapidly as they occur. In the other method, few repairs are made for a number of years. When the road becomes badly worn a new dressing of stone is applied. There is also an intermediate plan of large patching. Before applying new metaling, as the broken stone is called, the upper portion of the worn roadway is often loosened to a depth of 1 or 2 inches, by means of teeth or other picking devices, attached to road-rollers (see ROAD AND STREET MACHINERY), or by hand. The loosened surface is sprinkled and rolled much the same as in new construction. The dust

ROAD, LAW OF THE. See RULES OF THE ROAD.

ROAD AND STREET MACHINERY. Under this head may be included the various implements, other than hand tools, used in constructing and maintaining roads and streets, with the exception of such apparatus as is peculiar to the construction of asphalt pavements. (See PAVEMENT). Ordinary plows and scrapers for loosening and moving the natural earth surface in the preparation of the roadbed need no extended description. Scrapers of this sort are either *drag* or *wheel*, according to whether their bottoms rest on the surface of the earth when their loads are being moved, or whether the whole scraper is

ROAD MACHINE.

and mud that inevitably form on macadam roads should be swept or scraped off, as the case may be, and until the dust seems uncontrollable it may be laid by sprinkling. Wide tires for all heavily loaded vehicles lessen the wear of roads; and they are required by law in some sections.

BIBLIOGRAPHY. Consult the authorities named under PAVEMENT, particularly Aiken, Byrne, and Maxwell; also Shaler, *American Highways* (New York, 1896), which, besides being a good and reliable presentation of the subject, is somewhat specific as to the work of the Massachusetts Highway Commission; Rockwell, *Roads and Pavements in France* (New York, 1896), a brief review by an American of the notable system of French road maintenance; Codrington, *Maintenance of Macadamized Roads* (London and New York, 2d ed., 1892), which gives British maintenance practice in detail, but is not up to date; Gillette, *Economics of Road Construction* (New York, 1901), discusses methods and costs of construction; Judson, *City Roads and Pavements* (Oswego, N. Y., 1894); Special Consular Reports on *Streets and Highways in Foreign Countries*, vol. iii. (Washington, D. C., 1891; reprinted in 1897); Roy Stone, *New Roads and Road Legislation in the United States* (New York, 1894); Jenks, *Road Legislation for the American State* (Baltimore, 1889); *Road Inquiry Bulletins* of the United States Department of Agriculture; and reports of the Massachusetts, Connecticut, and New Jersey Highway Commissions, and (from 1898) of the State Engineer of New York, and of the Ontario Provincial Instructor in Roadmaking. See PAVEMENT; ROAD AND STREET MACHINERY; STREET.

ROAD (in law). See HIGHWAY.

mounted on and conveyed between two wheels. There is another class of scraper, more properly called a *road machine*, which consists of a long inclined blade, generally of steel, mounted diagonally between two pairs of wheels, and capable of vertical adjustment so as to vary its cutting depth and also permit it to conform to the angle of the road surface. These machines are drawn by horses and throw the earth from the side toward the centre of the road. Another machine used in road construction is known as a *grader*, or *grader and ditcher*. It loosens the earth by means of a plow mounted between two sets of wheels, lifts it on to a converging belt, and dumps it into the roadway, the waste banks at the side, or into a wagon for removal to some more distant point.

ROAD ROLLERS are largely used to compact roads formed by embankments; to solidify roadbeds whether in cut or fill, in order to give as unyielding a foundation as possible to surfacing of more durable material; and finally for compressing broken stone or asphalt and for bringing the various classes of block pavements to a firm bed and regular surface. The steam rollers are equipped with boilers and driving engines; the horse rollers consist of little but the rollers themselves. The rollers proper, in both classes, consist of one or more revolving hollow iron cylinders, resembling very broad wheels, mounted on an axis. The axis is attached to the front end of the driving engine or, in the case of horse rollers, a frame supporting a seat is mounted on the axis and over the roller and a pole and whiffletree are attached to the front of the frame. The weight of rollers ranges from 2½ to 20 tons, steam rollers being the heaviest.

STONE OR ROCK CRUSHERS are used to break stone into small sizes for macadam or the upper portion of self-bord roads and for use in preparing concrete. (See GRINDING AND CRUSHING MACHINERY.) Screens are for separating broken stone into various sizes. (See ORE-DRESSING.) Further operations connected with getting out stone for road work are treated under QUARRYING. Stone-spreaders are used to distribute broken stone in layers of regular thickness on road surfaces. The machine consists of a wagon, on which is mounted a box whose forward end may be raised to give the bottom any desired slope, and of a trailing box reaching to the ground, having a scraper attached to its bottom and rear. By adjusting this scraper the depth of the stone may be regulated at will.

SPRINKLERS are used to moisten earth and stone used in road construction, and to lay the dust on completed streets. Their most common form is a cylindrical tank, mounted on four wheels, and with the sprinkler proper attached to the rear of the wagon. The sprinkler is a perforated tube, or tubes, adjusted to throw the water out in a spray, or shower, at the rear and sides. Sometimes special street railway cars are equipped with sprinklers, for watering the portion of the streets between and for a little space each side of the tracks. About 1895 a street-car sprinkler was introduced which waters a half of the full width of the street at a time, by means of a swinging arm attached to the side of the car.

SCRAPERS FOR CLEANING STREETS are employed to remove stiff mud from roads and streets, and particularly from broken-stone roads. They consist of a series of steel or iron teeth, or long curved blades 3 to 5 inches wide, attached to a framework in such a manner that they will yield to and pass over irregularities in road and street surfaces without tearing up the stone or other material. They pile up the mud at one side.

STREET SWEEPERS of many types are employed to collect street dust and dirt for removal. Most of them consist of a revolving broom, mounted diagonally beneath and at the rear of a four-wheeled truck. The ordinary sweepers throw the dirt out to one side, in a continuous heap or row. In recent years various *pick-up sweepers* have been invented and to a rather limited extent introduced. Most of them throw the dirt on to a conveyor actuated by the revolutions of the axis of the wagon, and one type picks up the dirt by means of an exhaust fan, driven by an engine mounted on the machine. Nearly all the sweeping machines are drawn by horses, including the one just described, but toward the close of the nineteenth century the introduction of self-propelled sweepers was begun.

SCARIFIERS, for loosening the surface of macadamized roads prior to re-surfacing, are used quite extensively in England. They consist of teeth, tines, or drills, attached to a special machine or to a road roller in such a way as to tear up the surface to a slight depth, by actions similar to plowing, drilling, or hammer blows, according to the machine. In the United States the same end is attained by fastening spikes to steam road-rollers, or by means of specially shaped plows.

The use of broken stone for road surfaces depends very largely upon the development and use of two of the classes of machinery described in this article, road rollers and stone crushers. The first practical road roller was made in France, in

1787, by M. de Cessart, Inspector-General of Bridges and Roads. It was made of cast iron, was three feet in diameter and eight feet wide. In 1817 a road roller was patented in England by Philip H. Clay, and in 1825 another English patent on a road roller was granted to John Biddle. Various writers place the beginnings of the continuous use of road rollers in both France and England during the period 1830-40. Some credit the French engineers with being pioneers in this respect, in 1820. Steam road rollers, which have now largely replaced horse rollers where the use of the former is feasible, were first patented in France early in 1859, by Louis Lemoine, of Bordeaux. A roller weighing ten long tons (22,400 pounds) was immediately built. It was used in Bordeaux, and in 1860 it was also used in Paris. In 1863 W. Clark, of Calcutta, India, and W. F. Batho, of Birmingham, England, patented a steam road roller, and in 1864 a machine built after their patent was shipped from Birmingham to Calcutta. Several other rollers of this type followed in England, the most successful of which, judging from its subsequent wide adoption, was that of Ayeling and Porter, of Rochester, England. This firm seems to have combined, in 1865, a road traction engine with rollers, substituting the latter, on very broad wheels, for the ordinary wheels of the engine. In 1867 the same firm made a 30-ton (67,200 pounds) roller for Liverpool, a weight which is now considered excessive. Since 1880 several American steam rollers have been introduced.

The first stone-crushing machine was invented by Eli Whitney Blake (q.v.), of Connecticut, in 1852-57. It was introduced in England in 1860 and has since been used, with or without modifications, all over the world. It was a jaw crusher. Other types of crushers have been introduced since then, but few, if any, have been so extensively used. See GRINDING AND CRUSHING MACHINERY; ORE-DRESSING; PAVEMENTS; QUARRY, QUARRYING; and ROAD. Consult: Byrne, *Highway Construction* (New York and London, 1900); and Aitken, *Roadmaking and Maintenance* (London and Philadelphia, 1900).

ROAD-RUNNER. A curious and interesting ground-cuckoo (*Geococcyx Californianus*) of the Southwestern United States, also called 'chaparral-cock,' 'snake-killer,' and 'paisano.' It is nearly two feet long, of which the tail is about one-half. The plumage is bronzy or coppery green, changing to dark steel blue on the head, everywhere except on the rump streaked with white or tawny; under parts soiled whitish, streaked with black on the throat, breast, and sides. The road-runner is notable for its swiftness of foot, for, aided by its wings, it is said to equal the speed of a horse. It is almost omnivorous, but reptiles and mollusks form a large part of its diet. The nest is a flimsy structure of twigs in a bush, and the white eggs are 6 to 9 in number. Like other cuckoos, the incubation begins as soon as one egg is laid, so that fresh eggs and young birds may be found in the same nest. It is said that road-runners can be domesticated, and then make very interesting pets. Another species (*Geococcyx affinis*) inhabits Southern Mexico and Guatemala. Consult Cooper, *Birds of California* (San Francisco, 1870). See Plate of CUCKOOS.

ROADS AND RAILROADS, MILITARY. Military roads are of two general classes:

First, those incidental to the advance of civilization and the development of a new country; as, for example, in the case of the many roads constructed by army officers during the development of the western and central portion of the United States, and such as are now being constructed in places in the Philippines. These roads are simply such modifications of ordinary country and macadamized roads as seem best to suit the purposes in hand. Frequently their main object is to keep up a line of communication for the supply of permanent garrisons in time of peace. The second class comprises new roads and repairs to existing roads incident to the active operations of an army. These are sometimes short pieces of road built to furnish communication to and between different parts of camps and fighting lines where they are used for a period extending from several days to months, and sometimes roads necessary for the movement of an army and used perhaps but once. There are many excellent examples of work of this kind by the United States Army in the Civil War. Some of the commanding generals organized pioneer companies in each regiment whose special duty it was to keep the roads and bridges in proper shape for the movement of the army. The work consisted generally in such repairs to existing dirt roads as would make them capable of standing the passage of a large body of troops with its trains. It will readily be seen that in such cases makeshift methods were followed that would not be tolerated under other circumstances. Frequently tolerable results were secured by placing on the roads brush, corn-stalks, and similar material which were bound together sufficiently to permit of temporary use, but which eventually probably left the road in as bad if not worse condition than before they were used. A favorite method, where applicable, was to corduroy the road. This was done if timber were accessible by cutting down trees and saplings, laying a line of logs parallel to the axis of the road and covering them with small saplings placed across the road. These were fastened down, and, if time afforded, were smoothed on top or covered with dirt. Many modifications of this method have been used. Instead of saplings, brush is sometimes bound together in bundles and used similarly.

Where sawed timber could be quickly and easily procured, roads have been planked in the same manner. An enormous quantity of this class of work was done by Sherman's army in marching northward from Savannah in the Civil War. It is evident that the method of repair of a road under such circumstances must depend almost entirely on the material at hand. It is usually out of the question to metal, or put stone on the road, as is done in macadamized roads for regular use. Still gravel is sometimes at hand and can be used for the purpose. Where time affords, the roads should always be carefully constructed according to approved methods. (See ROAD.) In view of the temporary character of military roads, greater slopes are permissible than in roads to be used for longer periods. It is usually considered admissible to increase the length of the road from 15 to 25 feet for the purpose of saving a foot of vertical height. Rarely less than 8 feet width should be given. If the road is not made wide enough to permit the passage of vehicles at all points, turnouts for this

purpose should be established at convenient intervals.

The longer movements of armies are made by rail or steamboat and in the early stages of war, during the mobilization of the army and the forwarding of its equipment and supplies, the railroad occupies a position of prime importance. In the wars of the future it will, of necessity, play a very important part in all operations, whether offensive or defensive. The objective railroad points are usually the large railroad centres, junctions, etc., the great objective point being the frontier, for throughout Continental Europe railroads are built as much for strategic reasons as for purely commercial purposes, so that their general direction is toward the frontiers, fortified places, magazines, general supply stations, and important points of rendezvous. The military powers of Europe include the personnel of railroads in their national military scheme of defense, so that on the call for mobilization the railroad employee at once becomes a component part of the military forces. So far as possible in a country like the United States, the operation is kept in the hands of the officers and employees of the road. During the Civil War the repairs made to roads by the military authorities became a matter of great importance, so much so that special construction corps were organized for the maintenance of certain pieces of roads. The most important railroad—those known to carry the principal supplies for the Northern Army—were frequently attacked and damaged in many places. Systematic provision was made for the material most likely to be used. The maintenance of the road proper, excepting at bridges, was of course simple. The difficulty experienced with bridges is referred to under the head of BRIDGES AND DOCKS, MILITARY.

ROAN ANTELOPE. One of the largest and finest antelopes of Central Africa (*Hippotragus equinus*), related to the oryx, and called 'bastard gemsbok' by the Boers. It stands more than four and a half feet high at the withers, and varies from bright roan-color to various tints of gray or brown, with the face dark brown, broken by a broad white streak in front of each eye, and a white nose. The horns of the bucks are massive, heavily ringed, and sweep backward in a scimitar-like curve which may measure from 33 to 42 inches. This species, though widely distributed, was never very numerous, nor inclined to gather into large herds. Consult authorities cited under ANTELOPE. See Plate of ANTELOPS.

ROANNE, rô'ân'. The capital of an arrondissement in the Department of Loire, France, on the left bank of the Loire, which is here navigable, 42 miles northwest of Lyons by rail (Map: France, L 5). Its streets are wide, and its houses handsome. The chief structures are the bridge over the Loire, the public library, and the college buildings. Roanne manufactures muslins, cilices, and woolen and other fabrics. Ship building is carried on. It has numerous Gallo-Roman remains. Population, in 1901, 34,901.

ROANOKE, rô'a-nôk'. A river formed in southern Virginia by the union of the Dan and the Staunton, which rise in the Blue Ridge (Map: Virginia, F 5). It flows in a winding southeast course of 250 miles through a fertile and picturesque valley in northeastern North

Carolina, and empties into Albemarle Sound. Its length, including the Staunton, is 450 miles, and it is navigable for steamers 150 miles to Weldon.

ROANOKE. A city in Roanoke County, Va., 56 miles west of Lynchburg; on the Roanoke River, and on the Norfolk and Western Railroad (Map: Virginia, D 4). It is picturesquely situated in the vicinity of the Blue Ridge Mountains, and has the Virginia College (female), Rebekah Sanitarium, and law and public libraries. Hollins Institute, a large women's college under Baptist control, is six miles distant to the north. Roanoke is mainly interested in railroading, having extensive construction and repair shops of the Norfolk and Western Railroad. Industrially, the city ranks sixth in the State, the value of its products in the census year of 1900 having been \$5,740,000. The most important manufactures are cars, locomotives, flouring and grist mill products, bridges, hydraulic engines, agricultural implements, lumber, brick, cigars and tobacco. The government is vested in a mayor, chosen biennially, and a unicameral council. In 1880 Roanoke, then called the town of Big Lick, had a population of only 639. In 1884 it was chartered as a city under its present name. Population, in 1890, 16,159; in 1900, 21,495.

ROANOKE COLLEGE. A coeducational college at Salem, Va., incorporated in 1853 as successor to the Virginia Institute. It remained open during the war, though without endowment, and has since had a rapid development. In addition to the collegiate department, with partially elective courses, leading to the degree of B.A., partial, preparatory, and commercial courses are offered. The attendance in 1903 was 164, with a faculty of 11 instructors. The library contained 22,000 volumes. The endowment was \$60,000, the income \$14,000, and the value of the grounds and four buildings was \$100,000.

ROANOKE ISLAND. An island off the coast of North Carolina, forming part of Dare County and separated from the mainland by Croatan Sound. It is noted as the site selected by Sir Walter Raleigh (q.v.) in his attempt at colonization in 1585-87. On February 8, 1862, a Union force under General Burnside captured the Confederate garrison.

ROARING (*laryngismus paraliticus*). A disease of the horse, usually caused by the pressure of an inflamed or hypertrophied bronchial gland which interferes with the proper functions of the left recurrent laryngeal nerve. In the case of genuine 'roaring' medical treatment is of no avail, but in the earlier stages of the disease a course of iodide of potassium is strongly advocated where the cause of the trouble is to be attributed to disease of the lymphatic glands.

ROARING BUCKIE. The name among British people, especially in Scotland, for the local species of *Fusus*, a large spiral (conch) shell which, when held to the ear, furnishes a muffled roaring sound which children are told is the sound of the sea in which the creature lived. Really it is the audible reverberation of the otherwise inaudible sound of the rushing of the blood in the internal ear.

ROASTING (in metallurgy). See COPPER.

ROB'ALO (Sp., *robalo*, Catalan *llobarro*, name for the European bass, probably from Lat. *labrus*, *labros*, from Gr. *λάβραξ*, *labrae*, sea-wolf, from

λάβρος, *labros*, furious, fierce, greedy). Any of several fishes of the tropical shores of America resembling sea-bass, but set apart in the family Centropomidae. All are robust, dark-colored fishes, from two to four feet in length, and several kinds are of great importance in the local markets. The most valuable in the West Indies and along the Spanish Main is the species *Centropomus undecimalis*, called also 'snook' and 'brochet-de-mer.'

ROBBER-FLY. Any one of the dipterous insects of the family Asilidae. These are strong, hairy, active, predatory flies, which are very numerous and always conspicuous, flying with a darting motion and preying upon many different kinds of insects. They are rather slender, but extremely strong, and are furnished with a large tapering hard beak inclosing a sharp lancet which is thrust out and cuts a severe wound in the body of the insect captured. The tip of the beak is bearded with stiff bristles which hold it securely in the wound into which it is crowded. They destroy very many injurious insects, but are noted enemies of the honey-bee.

ROBBER SYNOD. See EPHESUS, COUNCILS OF.

ROBBERY (OF. *robberie*, *roberie*, from *robber*, *rober*, to rob, from ML. *raubare*, from OHG. *raubōn*, Ger. *rauben*, Goth. *bi-raubōn*, AS. *rēafian*, Eng. *rauce*; connected with Lat. *rumpere*, to break, Skt. *rup*, to break, plunder). In substance robbery is an aggravated form of larceny, although at common law it is treated as an independent offense. It consists in the larcenous taking of personal property which is on the person of another, or under the immediate protection of his person, accomplished by means of violence or intimidation. The offense is thus both a crime against property and against the person. The mere force required in the asportation of the property taken is not sufficient to make the crime robbery. Thus pocket-picking by stealth, or even snatching money from the open hand when there is no resistance, is simple larceny. Threats which do not amount to threats of personal violence are not sufficient to constitute the taking robbery, as when one induces another to give up property by threats of criminal prosecution or to injure his reputation by slanderous statements. It has been held otherwise, however, when the threat was to prosecute for an unnatural offense. The violence need not be offered to the person giving up his property, but if offered to a person related to him by blood or marriage, and money or property be extorted for the purpose of protecting such relative from immediate personal violence, the offense is robbery. If the taking is accomplished without threat or violence, the use of violence as a means of retaining possession of the stolen property will not make the crime robbery. At common law robbery was a felony punishable by death. It is still deemed a felony, and is now punishable in England and the United States by penal servitude. See LARCENY. Consult the authorities referred to under CRIMINAL LAW.

ROB'BIA, DELLA. A celebrated family of Florentine sculptors and ceramists of the Renaissance, that flourished for nearly one hundred and fifty years. Its earliest and most widely known member was LUCA DELLA ROBBIA (1399-1482), sculptor and originator of the famous terra-cotta

LUCA DELLA ROBBIA

MADONNA AND CHILD

SH. 1. IN THE S. DEL TAVAN. F. 1. 1. 1.

productions bearing his name. He was born in Florence, the son of Simone di Marco della Robbia, a shoemaker, and was early apprenticed to a goldsmith. This craft he soon relinquished to work in bronze and marble, and attained great eminence as a sculptor, producing in both materials a series of superior works, by which his artistic standard must primarily be estimated, although he owes his universal popularity chiefly to his process of enameling terra-cotta figures.

Of his life we know very little. He may, as Baldinucci states, have received his training in sculpture from Ghiberti, but while his plastic work bears witness to a diligent study of that master's creations, it also shows an open eye and equally receptive feeling for the radically different art of Donatello. His individuality lies in the admirable equipoise between the idealism of the one and the realism of the other, having in common with Ghiberti the exalted feeling of beauty, the tasteful arrangement and easy flow of drapery, and with Donatello the serious observation of nature and vivid characterization. This is manifest in the master's earliest work known to us, the world-famed "Singing Galleries" (1431-40), ten panels in high relief, with groups of children singing, dancing, and playing upon musical instruments, equally remarkable for their truth and naturalness and for their grace of movement and form—easily Luca's master creation—executed for one of the organ galleries in the Duomo and now in the Cathedral Museum. His other works in marble comprise two unfinished reliefs of the "Deliverance and Crucifixion of Saint Peter" (1438), in the Bargello; the eight allegorical reliefs of "The Liberal Arts and their Representatives" (1437-40), on the north side of the Campanile; the "Tabernacle" (1442), in Santa Maria, at Peretola; and the "Tomb of Benozzo Federighi," Bishop of Fiesole (1457-58), in San Francesco di Paola, on the Via Bellosguardo, outside Florence. The most laborious task, however, on which Luca was engaged in the cathedral was the execution of the bronze door of the north sacristy (1446-67), with reliefs of the "Evangelists," the "Fathers of the Church," etc., each subject with attendant angels, the whole modeled with exquisite grace and unassuming dignity, one of the most perfect productions in bronze of the Quattrocento.

Meanwhile Luca had already entered upon the second phase of his activity and given to the world another new and beautiful art. Discouraged at his slender profits in the fashioning of such works, he endeavored to discover some new material, more plastic and capable of being made as durable as stone. After many experiments he succeeded, by coating his figures of clay with a stanniferous enamel, in producing works almost indestructible and very attractive in color. He was not the inventor of impervious glaze, which had been known and used in Italy for two centuries or more; but its application to sculpture in terra-cotta and that of the latter to architectural decoration was original with Luca, and sufficiently justifies his claim to the title of inventor and the immense vogue of the almost countless productions in enameled terra-cotta, attributed to him, in and out of Italy.

Among his numerous representations of the Virgin and Child, of infinite variety, one of the finest is the "Madonna Between Lily-Bearing Angels," over a shop in the Via dell' Agnolo (see

illustration), and of four preserved in the Bargello, the "Madonna Adored by Angels" (from San Piero on the Mercato Vecchio) and the "Madonna del Fuore" are of superior charm. Very ornamental are the "Five Great Medallions" in pale blue on a richly patterned ground in the vaulting of the mortuary chapel of the Cardinal of Portugal, in San Miniato, completed in 1466 and the best of his works on record. Out of Florence there is especially noteworthy the tympanum of the "Madonna and Four Saints" (1449-52), over the portal of San Domenico, at Urbino, and in non-Italian museums are to be noticed three large circular reliefs, two with allegorical figures of "Temperance" and "Faith," and one with the "Virgin and Child," in the Musée de Cluny, Paris; a huge polychrome medallion with the "Arms of King Rene of Anjou" (1442), and a "Monk Writing," in the South Kensington Museum, London; while the twelve majolica plaques, emblematic of the months, attributed to Luca, in the same collection, show little affinity with his work. In the Berlin Museum, a thorough study of the master's taste and skill in arrangement, his truth and variety of characterization, is afforded by several original reliefs of the Virgin and Child and a number of cast reproductions of truly human aspect. It should be mentioned that Luca never repeated his subjects, producing in every instance an entirely new creation. In what high esteem Luca was held by his contemporaries is attested by his election, in 1471, to the presidency of the Artists' Guild, which honor, however, he declined on the score of his great age and increasing infirmities. From 1446 to his death on February 20, 1482, he led a peaceful existence with his two orphaned nephews whom he had adopted as his sons.

He left a worthy successor to continue his work in his nephew and pupil ANDREA DELLA ROBBIA (1437-1528). Although inferior to Luca in power and grandeur of conception, Andrea was an artist of exquisite taste and feeling, the celestial charm of his youthful Madonnas reminding one of Mino da Fiesole. Unlike his uncle, he confined himself to works in terra-cotta, with a single exception, existing in the rich marble altar-piece in Santa Maria delle Grazie, outside Arezzo. Besides his many and varied figures of the Madonna, of which three may be seen in the Bargello, he has left us hardly anything more pleasing than those famous medallions with the "Bambini," on the facade of the Spedale degli Innocenti (Foundling Hospital) in Florence, each of the fourteen babes in swaddling clothes a life-like image of infant loveliness, with an individuality of its own. (See illustration to BAMBINO.) Here also, within the court, over the door to the chapel, is a graceful lunette with the "Annunciation." Among five excellent reliefs in the Cathedral of Arezzo, the most remarkable is a rotabile of the "Trinity." The fine altar-piece with the "Coronation of the Virgin," in the Monastery of L'Ossevaranza, near Siena, deserves especial notice. At Prato, where many of his best works may still be seen, there is particularly noteworthy the tympanum with a half-length "Madonna Between Saints Stephen and Lawrence" (1489), over the principal entrance to the cathedral. One of his finest works is the large rotabile of the "Last Judgment" (1501), in San Girolamo, at Volterra. The Berlin Museum contains a "Madonna and Saints," a masterpiece in

fully manner, and a small "Annunciation," unique in its rich coloring; and the Metropolitan Museum, New York, has a beautiful large retable of the "Assumption" (c.1480), a characteristic specimen of Andrea's art.

Of his seven sons, four worked with him and, after his death, continued to produce the Robbia ware. GIOVANNI (1469-c.1529), the eldest, chiefly assisted his father, and many pieces attributed to the latter are probably by Giovanni. An early example of his independent work is the magnificent "Lavabo" (font, 1497), in the sacristy of Santa Maria Novella, Florence. He is proved an artist of superior merit by the large altarpiece of the "Adoration of the Holy Child" (1521), in the Bargello, but his most elaborate production is the polychrome frieze, representing the "Seven Works of Mercy" (1525-29), in the Ospedale del Ceppo, at Pistoia.—LUCA (1475-c.1560), the Younger, is remembered by a beautiful tile pavement, made in 1518 under Raphael's supervision in the upper story of the Loggia in the Vatican.—GIROLAMO (1488-1566) was an architect and sculptor, went to France in 1528 and was employed by the royal family, notably by Francis I., for whom he built and decorated externally with reliefs in Robbia ware the Château de Madrid, in the Bois de Boulogne.

(London, 1886); Stegmann, "Die Bildhauerefamilie della Robbia," in Geymüller-Stegmann, *Die Architektur der Renaissance in Toscana* (Florence, 1885-96); and Vasari, *Lives*, etc., trans. and ed. by Blashfield and Hopkins, vol. i. (New York, 1896).

ROB'INS. WILFORD LASH (1857—). An American clergyman of the Protestant Episcopal Church, born in Boston. He graduated at Amherst in 1881, studied at the Cambridge (Mass.) Divinity School (B.D. 1889), was ordained priest in 1884, and held a parochial charge at Lexington, Mass. In 1887 he became dean of All Saints Cathedral Church, Albany, N. Y., and in 1903 was elected dean of the General Theological Seminary, New York City. He was known for his pulpit utterances prior to the appearance of his *Essay Toward Faith* (1901) and *A Christian Apologetic* (1902), works much read in England as well as in the United States.

ROBERT, *Fr. pron.* rô'bâr' (c.1054-1134). Duke of Normandy from 1087 to 1106. He was the eldest son of Duke William II. (later William I. of England), and early in life showed great skill in arms, but also habitual carelessness and indolence. His father refused to give him any share in the government, and Robert repeatedly rebelled against him. On the death of William, in 1087, he received Normandy as his inheritance. His rule was weak in the extreme and he involved himself in quarrels with his brothers William II. of England and Henry (later Henry I.). Finally in 1096 Robert assumed the cross, and pledged his duchy to William for

five years for ten thousand marks. In the crusade Robert proved to be at his best and he became one of the heroes of the expedition. After the capture of Jerusalem (1099), the royal crown was offered to him, but he refused, and returned to Normandy, arriving there in 1100. William II. was dead, and so Robert was released from his pledge, but he was soon engaged in war with Henry I. Finally Henry invaded Normandy, and at the battle of Tinchebray, September 29, 1106, Robert was defeated and captured. He was kept in confinement for the rest of his life, dying at Cardiff, February 10, 1134. Consult Freeman, *History of the Norman Conquest* (6 vols., Oxford, 1867-79).

ROBERT I., THE DEVIL (?-1035). Duke of Normandy from 1028 to 1035. He was a son of Duke Richard II., and succeeded his brother Richard III. as Duke of Normandy. He combined cruelty and unscrupulousness with energy, audacity, and a handsome figure. He humiliated his vassals, and conquered districts from his neighbors. He espoused the cause of Count Baldwin IV. of Flanders against his son; of Henry I. of France against his mother Constance; and of his nephews Alfred and Edward of England against Canute of Denmark. In 1033 he undertook a pilgrimage to Jerusalem, as a penance for his sins. He died in 1035 while on his return, and was succeeded by his natural son William, later the conqueror of England. Many legends arose concerning him, like that embodied in the novel, *La vie du terrible Robert le Diable, lequel fut après l'homme de Dieu*, which appeared at Paris in 1496. Consult Richomme, *Origines de Falaise*, etc. (Falaise, 1851).

ROBERT II. (971-1031). A king of France, son of Hugh Capet, whom he succeeded on the throne in 996. He was educated by Gerbert of Rheims, was a scholar and a poet, and especially prominent as a composer and hymn-writer, and gained the surname "The Pious." His rule was weak and unfortunate, and the country suffered from the Papal interdiction laid upon the King because of his marriage with Bertha of Burgundy, his cousin. He put her away in 1004 and married Constance of Arles, daughter of Guillaume Taillefer of Toulouse, a selfish and ambitious woman. Consult Pfister, *Études sur le règne de Robert le Pieux* (Paris, 1885).

ROBERT I. King of Scotland, better known as Robert Bruce (q.v.).

ROBERT II. (1316-90). King of Scotland from 1371 to 1390. His father was Walter, the Steward of Scotland, and his mother Marjory, daughter of Robert Bruce. During the reign of his uncle, David II., he was one of the most prominent of the patriotic nobles of Scotland, acting as Regent or joint Regent during three different periods, and he was present at the battle of Halidon Hill (1333) and Neville's Cross (1346). On the death of David he obtained the crown, and became the founder of the Stewart, or Stuart, dynasty, in virtue of the law of succession adopted by the council of estates held in 1318. Partly from disposition and partly from the infirmities of age, Robert proved a peaceable, inactive ruler. The wars waged with England after 1377 were conducted by the powerful barons, particularly the Earls of Douglas, Mar. and Moray. These contests, which consisted to a large extent of border

raids, caused great suffering on both sides. The chief incidents of Robert's reign were the attack on Scotland by an English military and naval force under the command of the Duke of Lancaster (see JOHN OF GAUNT); the invasion of King Richard II. himself in 1385, which wasted the land as far as Edinburgh and Fife; and the retaliatory expedition of the Scotch in 1388, when two armies invaded and devastated England. The smaller body on its return home won, though at the expense of the life of its gallant leader, James, Earl of Douglas, the brilliant victory of Otterburn. (See CHEVY CHASE.) In 1389 the estates practically deposed Robert by making his son guardian of the kingdom. Robert died at his castle of Dundonald, in Ayrshire, May 13, 1390. Consult: Tytler, *History of Scotland*, various editions; Stuart, *History of the Stuarts* (London, 1798).

ROBERT III. (c.1340-1406). King of Scotland from 1390 to 1406. He was the son of Robert II. He was originally called John, Earl of Carrick, but changed his name on his accession to the throne in order to continue the name held by his father and grandfather. His ineptitude as a ruler virtually placed the reins of government in the hands of his ambitious brother, Robert, Earl of Fife, whom, in 1398, he created Duke of Albany. The latter in 1402 probably brought about the death of the King's eldest son, the Duke of Rothesay, because he was in danger of being ousted from control. The principal events in Robert's reign were the invasion of Scotland in 1400 by Henry IV., of England, and the retaliatory expedition of the Scotch, which resulted in the complete defeat of the invaders at Homildon Hill (q.v.). Robert died at Rothesay, April 4, 1406, from grief, as is said, because his remaining son, later James I. (q.v.), was captured by the English while on his way to France. Sir Walter Scott, in the *Fair Maid of Perth*, has used some historical and traditional incidents of Robert's reign. Consult authorities cited under ROBERT II.

ROBERT, CHRISTOPHER RHINELANDER (1802-78). An American philanthropist, born at Brookhaven, Long Island. After five years as a shipping clerk in New York he removed to New Orleans, where he entered business for himself. In 1830 he returned to New York and founded the firm of Robert & Williams, of which he continued the senior member until his retirement from active business in 1862. At the time of the Crimean War he visited Constantinople and became interested in the subject of higher education in the Turkish Empire. In 1860 he invited the Rev. Cyrus Hamlin (q.v.) to visit the United States for the purpose of raising funds to endow a college on the Bosphorus and he himself subscribed \$10,000. The outbreak of the Civil War soon afterwards, however, made it impossible to arouse general interest in the project, so Mr. Robert undertook to carry it through alone. Until his death in 1878 he provided the running expenses of the college, and in his will left it one-fifth of his estate, his benefactions aggregating more than \$400,000.

ROBERT, rōbĕrt, KARL (1850—). A German archaeologist and classical philologist, professor in the University of Halle. He was born at Marburg. His most important publications are: *Eratosthenis Catasterismorum*

Reliquiar (1878); *Bild und Lied* (1881); *Antike Sarkophag-Reliefs* (1890); *Studien zur Ilias* (1901). He was also co-editor of *Hermes* and revisor of Preller's *Griechische Mythologie*, 10th ed. vol. 1. (1893).

ROBERT, rōbā'rt, Léopold (1794-1835). A Swiss-French genre painter, born at Les Esplatures, near La Chaux-de-Fonds, Switzerland. He studied engraving with Garadet, and painting under David and Gros. He went to Italy in 1818, and began what proved to be a popular series of pictures from brigand life. Afterwards he painted Italian peasants, such as "The Neapolitan Improvisator" (1824), "Peasant Women of the Campagna" (1824), and "Festival of the Madonna dell'Arco" (1827), all in the Louvre. His works are large figure compositions, lacking spontaneity, hard in color, and with academic precision of line. Robert was the first to paint subjects from contemporary life when everything classic was the fashion. For this reason he has been claimed by the Romantists, but he remained at heart a Classicist. He committed suicide in Venice in 1835. Consult Debeluze, *Notice sur la vie et les ouvrages de Léopold Robert* (Paris, 1838).

ROBERT D'ARBRISSEL, dār'brĕ'sĕl'. The founder of the Order of Fontevault (q.v.).

ROBERT DE LUZARCHES (?-1223). A French architect of the Gothic period. His name is derived from his birthplace in the Ile de France, of which school of architecture he was a lay member. In 1220 he was entrusted by Eyrard de Fouilly, Bishop of Amiens, with the reconstruction of the cathedral, which had been destroyed by fire two years previously. He furnished the general plan and directed the work, beginning, contrary to custom, with the nave. At the time of his death at Amiens, in 1223, the nave and south side of the transept had been carried to the height of several meters. His plans were, in the main, followed by his successors, Thomas de Cormont and his son Renaud, and we may therefore ascribe to him the general constructive features of the cathedral, which represent the highest and most perfect development of Gothic architecture in France. The school of architecture which he founded at Amiens became one of the most influential in France, and its influence radiated throughout Europe. In Germany, for instance, the Cathedral of Cologne is modeled upon that of Amiens.

ROBERT-FLEURY, rō'fĕr', JOSEPH NICHOLAS (1792-1890). A French historical painter, born at Cologne. He was a pupil of Girodet, Gros, and Horace Vernet at Paris, where he settled in 1826, after studying also for some time at Rome. In order to make his paintings historically accurate, he made deep studies of the period to be represented, even adopting the technical qualities of the painting of the epoch represented. His most important works include "Charles V. in the Monastery of Saint Yuste" (1857), "Massacres of Saint Bartholomew" (1833), the "Religious Conference at Poissy" (1840), "Jane Shore" (1850), and the "Pillage of a Jew's House, Venice" (1855), the last three in the Luxembourg Museum. His son, TONY ROBERT-FLEURY (1838—), an historical, genre, and portrait painter, was a pupil of Paul Delaroche and Léon Cogniet. In 1870 he won the grand medal of honor for the "Last Day of Ger-

in 1867, which was afterwards selected to illustrate France's part in the Luxembourg, as well as in the Universal Exposition, 1875. Among other works are "The Old Women of the Piazza Navona, Rome" (1867, Luxembourg), "Danaiids," "Mazarin and His Nieces," and the "Musical Cardinal."

ROBERT LE DIABLE, rō'bār' le dyā'bl'. An opera by Meyerbeer, produced in 1831, based upon the character of Robert I., the Devil (q.v.), Duke of Normandy.

ROBERT OF GLOUCESTER, glōs'tēr. An English (metrical) chronicler, of whom nothing is known, except that he was alive about the time of the great battle of Evesham (1265). The verse-chronicle bearing his name is a history of England. It exists in two recensions, which vary but little down to the end of the reign of Henry I. (1135). From this date they differ greatly, the one continuation being much longer than the other. Robert of Gloucester is usually credited with the longer continuation and may have written the original portion. The shorter continuation is apparently from another hand. The older portion was derived mainly from Geoffrey of Monmouth, Henry of Huntingdon, and William of Malmesbury. Thus only the longer continuation has value as an historical document, and the valuable part is that which deals with the Barons' War under Henry III., and as a whole the chief interest in the chronicle is linguistic. It is in the dialect of Gloucestershire, with which district the author shows minute familiarity. The principal extant manuscripts are the Harleian, the Cottonian, the Cambridge, and the Bodleian. The chronicle was edited by Hearne (Oxford, 1724; reissued 1810), and by Aldis Wright for the Rolls Series (2 vols., London, 1887).

ROBERTS, BENJAMIN STONE (1811-75). An American soldier, born at Manchester, Vt. He graduated at West Point in 1835, and became first lieutenant in July, 1837, but in 1839 resigned from the army. He then became a civil engineer, built the Champlain and Ogdensburg Railway, and in 1842 assisted in constructing the Russian railway system. In May, 1846, he reentered the United States Army as first lieutenant of mounted rifles, served under General Scott in the Mexican War, and was brevetted major for gallantry at Chapultepec, and lieutenant-colonel for services at Matamoros and the Pass of Galaxara. During the Civil War he served for a time in New Mexico as commander of the Southern District, and in July, 1862, was made brigadier-general of volunteers. He was then transferred to Virginia, where, as chief of cavalry and acting inspector-general, he fought at Cedar Mountain, Rappahannock Station, and the second battle of Bull Run. He was next sent to the Northwest, where he commanded an expedition against the Chippewa Indians. In 1864 he was made chief of cavalry in the Department of the Gulf, and early in 1865 was put in command of the District of West Tennessee. In March of the same year he was brevetted brigadier-general in the Regular Army. In 1866 he was appointed lieutenant-colonel of the Third Cavalry, and from 1868 to 1870 was professor of military science at Yale. He was the inventor of the Roberts breech-loading rifle.

ROBERTS, BENJAMIN TITUS (1823-93). An American divine, one of the founders of the Free Methodist Church, born in Leon, N. Y., and educated at Wesleyan University, where he graduated in 1848. For ten years he was a member of the Genesee Conference of the Methodist Episcopal Church and prominent among a body of strictly Wesleyan reformers whose criticism of modern conditions he voiced in the *Northern Independent* in 1857. This article was adjudged a slander and Roberts was expelled from the Church (1858). In 1860, with Joseph McCreery and others, he formed the Free Methodist Church, with changes of creed and government from the Methodist Episcopal Church, and special stress on the necessity of total abstinence, plainness of dress, and so on. Roberts was general superintendent of the new denomination (1860-93), and president of its seminary in North Chili, N. Y. He founded and edited *The Earnest Christian* (1860-93), and edited *The Free Methodist* (1886-90).

ROBERTS, CHARLES GEORGE DOUGLAS (1860—). A Canadian poet and story writer, born at Douglas, near Fredericton, New Brunswick. He was educated at the Fredericton Collegiate School, and at the University of New Brunswick. For a short time he edited Goldwin Smith's newspaper, *The Week*, of Toronto (1883-84), and was professor of English and French literature in King's College, Nova Scotia (1885-87), and of economics and international law (1887-95). He resigned to devote himself wholly to literature. In 1897 he became associate editor of the *Illustrated American*, of New York. His volumes of verse comprise *Orion and Other Poems* (1880), *In Divers Tones* (1887), *Arc: An Ode for the Shelley Centenary* (1892), *Songs of the Common Day* (1893), *The Book of the Native* (1897), *New York Nocturnes* (1898). His prose includes *The Canadians of Old*, from the French of de Gaspé (1889), *Appleton's Canadian Guide* (1890), *The Raid from Beaujour* (1894), *Reube Dore's Shad Boat* (1895), *Around the Camp Fire* (1896), *Earth's Enigmas* (1896), *A History of Canada* (1897), *The Forge in the Forest* (1897), *A Sister to Evangeline* (1898), *By the Marshes of Minas* (1900), *The Heart of the Ancient Wood* (1900), *The Kindred of the Wild* (1902), and *Barbara Ludd* (1902). Roberts is one of the very few who have written about wild life without forsaking truth. His work shows not only understanding but imagination. See CANADIAN LITERATURE.

ROBERTS, DAVID (1796-1864). An English landscape and architectural painter, born at Stockbridge, near Edinburgh. He studied at the Trustees' Academy, Edinburgh, and began his career as scene-painter for Glasgow, Edinburgh, and London theatres, but executed no pictures of merit until after his first tour of the Continent in 1824. Afterwards he traveled extensively in Europe and in the East, devoting himself particularly to architecture and interiors. In 1841 he was made Royal Academician. Roberts produced works in both oils and water-colors. Among the former are "Interior of the Cathedral, Burgos," and the "Church of Saint Paul at Antwerp." National Gallery: "Antwerp Cathedral," London City Gallery; and "Sunset in Rome," Edinburgh National Gallery. The South Kensington Museum has several of his water-colors, including the "Great Temple of Edfou,

Egypt" (1838), "Pyramids from the Nile" (1845), and a "Gateway, Spain." As a result of his travels Roberts published several series of lithographed sketches (1839-59), the best known of which are *Sketches in Holy Land and Syria* and *Italy, Historical, Classical, and Picturesque*. His strength lies in a fine feeling for architectural effect, and in good detailed drawing rather than in color.

ROBERTS, EDMUND (1784-1836). An American diplomat, born at Portsmouth, N. H. At the age of sixteen he went to South America, and upon the death of a relative took charge of a large English mercantile house at Buenos Ayres. After living in London for a while he returned to the United States, and in 1832 was sent by President Jackson as an envoy to Siam, Cochinchina, and other countries of the Far East for the purpose of making commercial treaties. He returned in 1834 after successfully treating with Siam and Muscat, and in 1835 he started upon a second embassy, with Japan as the ultimate goal. Illness overtook the expedition and Roberts died at Macao, China, June 12, 1836, where he was buried. He narrated the history of his first expedition in *Embassy to Eastern Courts* (1837). Consult: Ruschenberger, *A Voyage Around the World, Including an Embassy to Muscat and Siam* (Philadelphia, 1838); Foster, *American Diplomacy in the Orient* (Cambridge, 1903).

ROBERTS, ELLIS HENRY (1827—). An American journalist and financier, born in Utica, N. Y., and educated at Yale. From 1851 to 1890 he was editor and for several years was proprietor of the *Utica Morning Herald*, a Whig and subsequently a Republican paper. He was a member of the State Legislature in 1867, and of Congress from 1871 to 1875, was Assistant Treasurer of the United States from 1889 to 1893, and was president of the Franklin National Bank, New York City, from 1893 to 1897, when he became Treasurer of the United States. He published *Government Revenue* (1884), and *New York, The Planting and Growth of the Empire State* (1887), in the "American Commonwealth Series."

ROBERTS, SIR FREDERICK SLEIGH, Earl Roberts of Kandahar, Pretoria, and Waterford (1832—). An eminent British soldier, son of General Sir Abraham Roberts, born at Cawnpore, in India, on September 30, 1832. He was educated at Eton, at the Royal Military College at Sandhurst, and at the college of the East India Company, at Addiscombe. At the close of 1851 he received a commission in the Bengal Artillery, and was sent to Peshawur, near the frontier of Afghanistan, where he served until 1857. During the Sepoy Mutiny, he actively participated in the reduction of Delhi, in the second relief and the siege of Lucknow, and in the relief of Agra and of Cawnpore, and was awarded the Victoria Cross. In 1863 he participated in the Umbeyla campaign and in 1867 became assistant quartermaster-general of the Bengal brigade which took part in the Abyssinian War.

At the outbreak of the Afghan War in 1878, though only a major in his regiment, he was major-general commanding in his division, that of Peshawur, and was selected to command one of the three columns organized to invade the enemy's country, being ordered to advance

through the Kuram Valley to the Shutargardan Pass. On December 24, at the Perwar Kotal, the summit of the pass leading from the Kuram Valley into Afghanistan, Roberts defeated a greatly superior force of the enemy. In October, 1879, he defeated a large force of Afghans, near Kabul, and took that city. In December, after a series of combats, he found it necessary to evacuate Kabul, and collected his forces in a fortified position at Shipur. Here he beat back the enemy and reentered the Afghan capital before the close of the month. In 1880 he performed a memorable march from Kabul for the relief of Kandahar, which he entered on August 31st. On the following day he dispersed the army of Ayub Khan, thus bringing the war to a close. After the British disaster at Mapla Hill, Roberts was sent to South Africa as commander-in-chief. Before his arrival, however, peace had been concluded. He was commander-in-chief of the Madras Army from 1881 until 1885, when he became commander-in-chief in India. In 1893 he was recalled to Europe and from 1895 until 1899 was in command of the forces in Ireland. In the latter year he was appointed commander-in-chief in South Africa. He marched successfully to the relief of Kimberley, and on February 27th, at Paardeberg, a force of Boers under Cronje was compelled to surrender. On March 13th Roberts entered Bloemfontein, the capital of the Orange Free State, and on May 28 formally annexed the Free State to the British Empire. On June 5th he occupied Pretoria, and on October 25th formally annexed the Transvaal. A few weeks later, thinking the war practically over, he returned to England, where he was decorated with the new Order of Merit, raised to the rank of earl and appointed commander-in-chief of the British Army. Lord Roberts published *The Rise of Wellington* (1895), and *Forty-one Years in India* (1897), an autobiography. For a more detailed account of his services in the Boer War, see SOUTH AFRICAN WAR.

ROBERTS, HOWARD (1843—). An American sculptor, born in Philadelphia. He was a pupil of Joseph A. Bailly at the Pennsylvania Academy of Fine Arts, and afterwards studied in Paris under Dumont and Gurney. His works include: "Hester and Pearl" (1872), a statuette; "La Première Pose" (1876); "Hypatia," and "Lot's Wife," both statuettes; a statue of Fulton in the Capitol at Washington, and numerous busts.

ROBERTS, ISAAC PHILLIPS (1833—). An American agriculturist and educator. He was born in Seneca County, N. Y. He became superintendent of the college farm at the Iowa State Agricultural College, and secretary of the board of trustees (1869), and in 1870 was elected professor of agriculture. He was awarded the degree of master of agriculture (1875) by this college. In 1873 he was elected professor of agriculture in Cornell University, in which institution he became dean of the College of Agriculture (1874) and director of the college and of the United States Agricultural Experiment Station (1888). In 1903 he became professor emeritus of agriculture in the university. For many years he was assistant editor of the *Country Gentleman*, and contributor to the columns of other leading agricultural journals. His published works in-

Man and the Day of the Land (1898); *The Farmer's Business* (1900); *The Farmer's Business II* (1903); and *The Horse* (1904).

ROBERTS, MORLEY (1857—). An English novelist and journalist, born in London, and educated at the Bedford Grammar School and at Owens College, Manchester. In 1874 he went out to Australia, where he worked as a laborer on the railroads and in the bush. Before 1887 he served as a sailor on several merchant ships, and saw many phases of Anglo-Saxon life in the South Seas, throughout North America, and in South Africa. His experiences enrich his many tales of adventure. Good specimens are *A Son of Empire* (1899) and *The Plunderers* (1900), giving an account of a sort of Jameson raid on the treasury of the Shah of Persia. *The Colossus* (1899) has as characters well-known politicians, as Cecil Rhodes, thinly disguised under fictitious names. Other romances are: *The Western Arcus* (1887); *In Low Relief* (1890); *Red Earth* (1894); *The Master of the Silver Sea* (1895); *Maurice Quain* (1897); *Strong Men and True* (1897); *The Descent of the Duchess* (1900); *The Fugitives* (1901); a volume of verse called *Songs of Energy* (1891); *Immortal Youth* (1902); and *The Way of a Man* (1902).

ROBERTS, ORAN MILO (1815-98). An American jurist and Governor, born in Laurens County, S. C. He graduated at the University of Alabama in 1836, was admitted to the bar in 1837, practiced law for some time, and in 1841 removed to the Republic of Texas. After the admission of Texas to the Union in 1846 he served until 1851 as a district judge. In 1857 he was elected an associate justice of the Texas Supreme Court. In 1862 he became colonel of the Eleventh Texas Volunteers, and saw active service with the Confederate forces west of the Mississippi until 1864, when he resigned his commission to become Chief Justice of the Texas Supreme Court. Displaced during the reconstruction period, he was active in the new constitutional convention in 1866, and in the same year was elected United States Senator, but political disabilities prevented his taking his seat. In 1874 he again became Chief Justice of the State and he remained on the bench until he was elected Governor in 1878. He was reelected in 1880, and declined a third term in 1882. From 1883 until 1893 he was a professor of law in the State University. He was the author of *A Description of Texas* (1881); *Elements of Texas Pleading* (1891); and *Our Federal Relations* (1892), a statement of the Southern side of the slavery controversy.

ROBERTS, SIR WILLIAM (1830-99). An English physician, born at Bodedern, Wales, and educated at University College, London. After studying in Paris and Berlin he became house-surgeon, and in 1855 full physician to the Manchester Royal Infirmary—a post which he held until 1883. He was a fellow of the Royal Society, received the Cameron prize in 1879, and on his coming to London became a fellow of London University. The use of predigested foods for the nutrition of invalids was introduced into England by him and he was an authority on diet. Roberts's name is associated with the discovery of *Solution of Murex and Tannin* (1863), in which 'Roberts's murex' were described; *Urinary and Renal Disease* (1865; 4th ed. 1885); *Diges-*

tive Ferments (Lumleian Lectures, 1880); and *Dietetics and Dyspepsia* (1885).

ROBERTS, WILLIAM CHARLES (1832—). An American Presbyterian minister and educator, born near Aberystwith, Wales. He graduated at Princeton University in 1855, and at Princeton Theological Seminary in 1858, and in that year became pastor of a church in Wilmington, Del. Afterwards he had charge of churches in Columbus, Ohio, and Elizabeth, N. J. From 1880 until 1886 he was corresponding secretary of the Board of Home Missions, New York City, and again from 1892 until 1898. In 1886-92 he was president of Lake Forest University, Chicago, and in 1898 was made president of Centre College, Ky.

ROBERTS, WILLIAM HENRY (1844—). An American Presbyterian clergyman, born at Holyhead, Wales. He graduated at the College of the city of New York in 1863 and at Princeton Theological Seminary in 1873. Meanwhile he had been statistician in the United States Treasury Department, and assistant librarian of Congress. In 1878-86 he was librarian at Princeton Theological Seminary. From 1886 until 1893 he was professor in Lane Theological Seminary, Cincinnati, Ohio. His works include: *History of the Presbyterian Church* (1888); *The Presbyterian System* (1895); and *Laws Relating to Religious Corporations* (1896).

ROBERTS, WILLIAM MILNOR (1810-81). An eminent American civil engineer, born in Philadelphia, Pa. He began his service as an engineer in 1825, when he became a member in a minor capacity of the engineer corps engaged in the construction of the Union Canal of Pennsylvania. From 1827 to 1831 he was engaged on the improvement of the Lehigh Railroad Canal; from 1831 to 1835 was senior assistant engineer in the construction of the Allegheny Portage Railroad, and from 1835 to 1837 was chief engineer of the Lancaster and Harrisburg Railroad, acting in 1836 and 1837 as chief engineer of the Cumberland Valley Railroad as well. In 1838-40 he was chief engineer, in the State service, of the extension of the State canals of Pennsylvania, and during 1841-44 was engaged successively on the enlargement of the Welland Canal of Canada and the Erie Canal of Pennsylvania. From 1857 to 1865 he lived in Brazil, constructing during this time the Dom Pedro Segundo Railroad. From 1869 to 1879 he was chief engineer of the Northern Pacific Railroad, and during this period was a member, also, of various important engineering commissions. He died of yellow fever on July 14, 1881, in the Province of Minas Geraes, Brazil.

ROBERTS-AUSTEN, SIR WILLIAM (1843-1902). An English metallurgist, educated at the Royal School of Mines. He was appointed chemist of the mint in 1870; in 1880 succeeded Percy as professor of metallurgy in the Royal School of Mines; and during the last year of his life was deputy master of the mint *ad interim*. His most important work was in the study of alloys, and his reports (1891, 1893, 1897, 1899) developed the system of the cooling curve, showed the significance of metallic freezing points, and in general greatly advanced the molecular theory of alloys. Roberts-Austen improved the pyrometer, making it photographically self-recording, and

devised methods for several new alloys, among them that of gold and aluminum.

ROBERTSON, AGNES. An English actress. See BOUCAULT, Mrs. DIXON.

ROBERTSON, FREDERICK WILLIAM (1816-53). One of the most famous of English preachers. He was born in London, February 3, 1816, and was educated at Edinburgh. After a year spent in the study of law, at the age of twenty-one he was entered at Brasenose College, Oxford, to study for the ministry, and immediately on his graduation in 1840 he was ordained deacon. His first curacy was that of Saint Maurice and Saint Mary Kalendar, Winchester; but his health failed at the end of a year and he was forced to seek rest on the Continent. His next curacy was at Christ Church, Cheltenham, where he remained four years, and then again sought rest in the Tyrol. In 1847 he went to Saint Ebbe's, Oxford, and from there, in August of the same year, to Trinity Chapel, Brighton. This was the scene of his most successful labors, and he is familiarly known as 'Robertson of Brighton.' But he was not strong, and the work was hard. In 1852 he gave signs of failing health, and he died the following year.

Robertson was a man of singular beauty and strength of character. He inherited military spirit and was celebrated for the soldierly qualities of courage, self-devotion, and adherence to duty. Theologically he began as a moderate Calvinist of the Evangelical type, but he became dissatisfied with Evangelicalism during his four years at Cheltenham, and after a bitter struggle embraced opinions which antagonized the orthodoxy of his day and marked him as a 'Broad' churchman. At one time, in the early days of his ministry, he cultivated the ascetic life with great rigidity, but broke down under the physical strain. He was preëminently a preacher rather than a theologian, and his fame rests almost exclusively upon his sermons and addresses at Brighton, which have been published in many editions. In his character and his preaching he appealed to thoughtful men of all classes in society and of all shades in religious belief. The devotion of the workmen of Brighton to him was pathetic. He practically founded their institute and they found in him a friend and brother. The handsome monument erected to his memory in the cemetery at Brighton bears on one of its faces their tribute to his memory in the bronze medallion which they placed on their benefactor's tomb. Consult the *Life and Letters of F. W. Robertson*, edited by Stopford Brooke (London, 1865).

ROBERTSON, GEORGE CROOM (1842-92). A Scottish philosopher, born at Aberdeen. He took his degree of M.A. at the University of Aberdeen (1861), where he formed a lasting and helpful friendship with Prof. Alexander Bain (q.v.), and continued his philosophical studies at University College, London, and in France and Germany. After holding a minor appointment in Greek at Aberdeen, he was elected (1866) professor of mental philosophy and logic in University College. This position he held till just before his death. In spite of ill health, Robertson exerted a great influence on his time. He was the first editor of *Mind*, and wrote important articles for the ninth edition of the *Encyclopædia Britannica*. His contributions to *Mind* were

collected into a memoir by Professor Bain under the title *Philosophical Remarks* (London and Edinburgh, 1891); and two volumes of his lectures in University College from 1870 to 1892 were published from notes by Rhys Davids under the title *Lectures on General Philosophy and Elements of Psychology* (London, 1896).

ROBERTSON, JAMES (1725-88). An English soldier, Governor of New York during a part of the Revolutionary War. He was born in Fife-shire, and while a young man entered the army as a private. He served in America in the French and Indian War, first as major in the Royal American Troops, then as deputy quartermaster, and finally as lieutenant colonel in the campaign against Fort Mifflin. After the war he became barrack-master in New York City, and is said to have acquired a fortune by clipping the coin used in buying supplies and by other unscrupulous methods. He was promoted colonel in 1772, was with the British army during the siege of Boston, and commanded a brigade at the battle of Long Island. He was made a major-general in 1779, and in the same year was appointed civil Governor of New York. His administration was arbitrary and corrupt, and by his actions he alienated many who were still favorable to the royal cause. In 1781 he was appointed commander in chief in Virginia, but owing to the arrival of Cornwallis in that province, he returned to New York. He died in London. Consult Jones, *History of New York During the Revolutionary War*, edited by De Lancey (New York, 1879).

ROBERTSON, JAMES (1742-1814). An American pioneer, born in Brunswick County, Va., whence his parents early removed to North Carolina. In 1770 he crossed the Alleghanies with Daniel Boone, and lived for a time on the Watanga River. He returned to North Carolina, and in 1771 led a party of settlers to the Watanga region, and was one of the founders of the Watauga Association (q.v.). When this region was found to be a part of the Cherokee lands of North Carolina, Robertson went as commissioner to the Indians. With John Sevier (q.v.) and forty men he withstood a fierce attack on the fort by the Indians under Oconostota. In 1778 he joined Richard Henderson (q.v.) in the settlement of a large tract of land on the Cumberland, and founded Nashborough (the present city of Nashville). On the formation of the 'Compact' in 1780 he was elected chairman of the board of 'General Arbitrators' or 'Notables' and colonel of the forces. Robertson was almost constantly engaged in Indian battles, led the Cold Water Expedition in 1785, and invaded the Indian country. On the organization of Tennessee as a Territory in 1791, he became brigadier-general of the western or Miro district. He was a member of the convention to form a State Constitution in 1786, and afterwards acted as Indian agent. He was a State Senator in 1798, and a trustee of the Davidson Academy (Cumberland College) in 1803. In 1805, as special agent to the Chickasaws, he secured by the compact of July 23d the cession of much of their land, and the same year secured the Choctaw lands in Mississippi. He was afterwards called upon to arbitrate differences arising from confusion of boundaries. During the War of 1812 he did much to prevent the Indians from joining the British. Consult: Putnam, *Life and Times of*

of *James Robertson* (Nashville, 1859); and *Robertson, Wanning of the West* (New York, 1889-90).

ROBERTSON, JAMES CRAIGIE (1813-82). An English clergyman and historian. He was born at Aberdeen, graduated from Trinity College, Cambridge, in 1831, and was ordained in 1836. He began literary work during his early clerical appointments and his first book, *How Shall We Conform to the Liturgy?* (1843), showed the liberal tendencies of his mind. In 1846 he became vicar of Bekesbourne, and canon of Canterbury in 1859, retaining this office to the time of his death; from 1861 to 1874 he was professor of ecclesiastical history at King's College, London. His works, more notable for accurate learning than for literary style, comprise a *History of the Christian Church from the Apostolic Age to the Reformation* (1874-75); *Becket, a Biography* (1859); *Plain Lectures on the Growth of the Papal Power* (1876); editions of Heylyn's *History of the Reformation* (1849); *Burgave's Alexander VII. and the College of Cardinals* (1866) for the Canadian Society; and *Materials for the History of Archbishop Thomas Becket* (6 vols., 1875-82) for the Master of the Rolls. Volume vi. of the last, being uncompleted at his death, was finished by Dr. J. Brigstocke Sheppard.

ROBERTSON, JAMES LOGIE (pen-name, HUGH HALIBURTON) (1846—). A Scottish verse-writer, born at Milnathort, Kinross-shire. He took the degree of M.A. from the University of Edinburgh in 1872, with honors in English literature. He became first English master in the Ladies' College at Edinburgh (1891). Travels in Scandinavia furnish him descriptive themes for some of his verse, but his best poems are short pastorals in the Scottish dialect. His published volumes are mainly *Poems* (1878); *Orcelana and Other Poems* (1881); *Our Holiday Among the Hills* (conjointly with his wife, 1882); *Horace in Homespain* (1886; new ed. 1900); *Ochil Idylls* (1891); *Adaptations from Dunbar* (1895); *The White Angel, and Other Stories* (1886); *For Pair Auld Scotland* (1887); *In Scottish Fields* (1890); and *Furth in Field* (1894). His editorial work concerns the poems of Allan Ramsay (1887), Thomson (1891), Scott (1894), and Burns (1896), and the *Select Chaucer* (1902).

ROBERTSON, JOSEPH (1810-66). A Scottish antiquary and historian. He was born at Aberdeen; was educated at Marischal College, Aberdeen, and was apprenticed to the law, which he gave up for literature. He bore the chief hand in the formation of the Spalding Club for printing the historical and literary remains of the northern counties of Scotland (1839); edited, in turn, the *Aberdon Constitutional*, the *Glasgow Constitutional*, and the *Edinburgh Courant*; and was appointed historical curator in the Edinburgh Register House (1853). Robertson's work comprises *Delicia Litteraria* (1839), a volume of table-talk; *Illustrations of the Topography and Antiquities of Aberdeen and Banff* (4 vols., 1842-69); *Diary of Gen. Patrick Gordon, 1635-99* (1862); *Lecturarius of Jewels, Dresses, Furniture, Books, and Paintings Belonging to Queen Mary* (Bannatyne Club, 1863); and *Concilia Ecclesie Scotticana, 1225-1559* (Bannatyne Club, 1866), a work displaying immense research in

the ecclesiastical history of Scotland. To the *Quarterly Review* (June, 1849) Robertson contributed a valuable essay on *Scottish Abbeys and Cathedrals*. Consult the *Memoir* prefixed to this last work (Aberdeen, 1891).

ROBERTSON, THOMAS WILLIAM (1829-71). An English dramatist. He was born at Newark-on-Trent, of a family connected with the theatre for several generations. Mrs. Kendal (q.v.) was his youngest sister. During his childhood and youth he was an actor in the provincial company of which his father was manager. He went to London in 1848 and became a writer for the magazines; for a time, too, he continued upon the stage, and in 1856 he married an actress, Miss Burton. His first play, *J. Night's Adventure*, was produced by Farren at the Olympic Theatre in 1851. His first important success, however, was *David Garrick*, which was brought out in 1864, and with Sothern's acting had afterwards a long run. His *Society* was produced by the Bancrofts at the Prince of Wales' Theatre in 1865. His reputation chiefly rests upon the series of comedies which succeeded it, including *Ours* (1866), *Caste* (1867), *Play* (1868), *School* (1869), and *M. P.* (1870). These are exhibitions of modern social life, with an element of satire directed at its artificialities. The epithet 'teacup and saucer school' of drama, which was applied by a critic to Robertson's work, is suggestive of its limitations. He was also the author of a novel called *David Garrick*, and of other fiction. His death occurred in London on February 3, 1871. Consult: *The Principal Dramatic Works of Thomas William Robertson, with Memoir by his Son* (London, 1889); Pemberton, *Life and Writings of T. W. Robertson* (ib., 1893); Cook, *Nights at the Play* (ib., 1883); Clement Scott, *The Drama of Yesterday and To-Day* (ib., 1899).

ROBERTSON, WILLIAM (1721-93). A well-known Scottish historian, born in the parish of Borthwick, Midlothian. Robertson was educated at the University of Edinburgh, and in 1741 he was licensed to preach. In 1746 he was elected to the General Assembly, but he gave most of his time to historical studies. In 1759 he published his celebrated *History of Scotland*, which was an immediate success, and brought the author considerable praise as well as various positions of dignity. The work itself is noted for sobriety and fairness as well as for literary excellence. In 1762 Robertson was made principal of the University of Edinburgh, and in 1763 he was elected moderator of the General Assembly, in which position he displayed great abilities as an administrator. Besides his *History of Scotland* he published in 1769 the *History of the Reign of Charles V.*, which is considered at present to be his best work. In 1777 appeared a *History of America*, and in 1784 a work on the knowledge the ancients had of India. Personally Robertson was a genial man possessing great conversational powers and having a large circle of friends. His writings are elegant and sonorous, but lack naturalness and vigor. All of his histories, however meritorious they were at the time of their publication, have now been superseded. Robertson's works have been published repeatedly, the best edition being in eight volumes (Oxford, 1825). Consult: Stewart, *An Account of the Life and Writings of William Robertson* (Edinburgh, 1801-02); Gleig, *An Account of the Life and*

Writings of William Robertson (Edinburgh, 1812).

ROBERTSON, WILLIAM H. (1823-98). An American politician, born in Redford, Westchester County, N. Y. He received an academic education, studied law, and began practice in his native town. His political career began in 1849 with his election as a Whig to the State Assembly. In 1854 he was elected to the State Senate, and in the same year was elected county judge of Westchester County, and remained on the bench until 1866. He allied himself with the Republican Party at its organization, and in 1866 he was elected a member of the Fortieth Congress. From 1872 to 1881 he was again a member of the State Senate. In 1881 his appointment as collector of the port of New York by President Garfield, whose nomination he had been largely instrumental in securing, by leading a part of the New York delegation at the national convention in 1880 to desert the Grant column, caused a serious split in the Republican Party. His nomination, made without consulting the wishes of the two Republican Senators, Roscoe Conkling (q.v.) and Thomas C. Platt (q.v.), was confirmed by the Senate, and led to the resignation of the two Senators from that body. In the bitter struggle between the 'Stalwart' and 'Half-Breed' factions which followed, Robertson was active in the campaign that resulted in the election of new Senators in the place of Conkling and Platt. Judge Robertson held the collectorship until 1885, when he resumed his law practice, and in 1888 was again elected to the State Senate.

ROBERVAL, rôbârvâl', GILLES PERSONNE DE (1602-75). A French mathematician, born at Roberval, whence the name by which he is commonly called. After four years' study in Paris he was appointed professor of philosophy at the Collège Gervais (1631), and in 1633 succeeded Marin in the chair of mathematics at the Collège de France, a position which he retained till his death. He was an eager fighter and quarreled bitterly with Cavalieri, insisting on the priority of his own discovery of the methods of the indivisibles, although he published nothing. Descartes he attacked because his method of constructing tangents appeared about the same time as his own; and with Torricelli he carried on an angry polemic as to which first discovered the method for determining the area of a cycloid. He is best known from the Robervallian lines, which he discovered, curves of infinite length inclosing a finite space. He also occupied himself with mechanics and physics, and is the inventor of a balance bearing his name. He was a member of the Academy of Sciences since its foundation in 1666. Gallois collected his writings and published them in the *Recueil* of the French Academy of Science (1693).

ROBERVAL, JEAN FRANÇOIS DE LA ROQUE, Sieur de (c.1500-?). A French colonist in Canada, born in Picardy, France. After the return of Jacques Cartier (q.v.) from his first voyage, in 1536, Roberval was commissioned by Francis I. to lead an expedition to Canada for the purpose of making new discoveries, and probably of establishing a settlement, he being appointed lieutenant-general and Cartier captain-general. Roberval sailed in April, 1542—Cartier having preceded him by almost a year—arrived at Newfoundland on June 7th, and win-

tered at Cape Rouge, his followers suffering terribly from starvation and cold. After June, 1543, when he seems to have started for the 'Province of Saguenay,' all authentic record of him is lost. According to Thevet, his friend, he returned to France and was killed in Paris; according to other accounts he died at sea.

ROBESPIERRE, rôb'spièr', AUGUSTIN BOZ Jost pu (1764-94). The younger brother of Maximilien Robespierre, born at Arras. He was educated at the Collège Louis-le-Grand at Paris, and then began the practice of law at Arras. He embraced the ideas of the French Revolution, and after holding a local office he was elected a member of the National Convention. In general he followed the policy of his brother. As a Deputy on mission he was present at the siege and capture of Toulon, where he recognized the genius of Bonaparte, whom he made one of his intimates. On his return to Paris he tried to influence his brother to milder measures, but finally acquiesced in the sterner policy and voluntarily shared his brother's fortunes on the 9th Thermidor. He was guillotined July 28, 1794.

ROBESPIERRE, MAXIMILIEN MARIE ISIDORE (1758-94). A French Revolutionary leader. He was born at Arras May 6, 1758, the eldest of the four children of Maximilien Barthélemi François de Robespierre and Jacqueline Marguerite Carrant. After some time spent in the college at Arras, Maximilien was given a scholarship by the Bishop of Arras which enabled him to complete his education in the Collège Louis-le-Grand at Paris. His brilliant career as a student gave him a reputation which proved of no little value upon his return to Arras in 1781 to begin the practice of his profession. His patron, the Bishop, appointed him criminal judge of the diocese of Arras in March, 1782, but he soon resigned the place rather than pronounce a death sentence. His literary tastes secured him an election to the Academy of Arras in 1783, and led him to compete, though with slight success, for prizes offered by the provincial academies. That he was reckoned one of the wits and dandies of the town is shown by his membership in a convivial society, the Rosati, of which Carnot was also a member. The summons of the States-General aroused him as it did hundreds of his fellows to political activity. Taking the popular side, he wrote pamphlets, engaged in discussions, and above all took care to look after his own fortunes. He was elected fifth Deputy of the Third Estate of the Province of Artois.

Entering the States-General at the age of thirty-one, he was almost unknown and without a personality that would command attention, so that in the reports of the early sessions the Parisian journalists referred to him simply as 'a Deputy.' Always adopting the popular and radical view, he spoke frequently, with such care in preparation and with such earnestness of manner that he soon overcame the defects of a shrill voice, small stature, pale nervous face, and twitching eyes partly concealed by greenish glasses, which he constantly raised and lowered as he delivered his long and polished periods with measured accents. His former school friend Camille Desmoulins took pleasure in acting as the self-appointed press agent of the brilliant young radical, and the pages of the *Revolutions de France et de Brabant* made the name of Robe-

spierre's orator throughout France. Mirabeau also a statesman and predicted, "That young man who says he will go far." But until the death of Mirabeau he, like others, was overshadowed by the greatest of the Revolutionists. It was not until May, 1791, that Robespierre began to exercise a real influence. In that month he pronounced his discourse favoring the abolition of the death penalty, and carried his unwise motion excluding from the future Legislative Assembly all members of the Constituent Assembly. During the summer of 1791 he opposed Barnave, Duport, and Lameth in the conservative revision of the Constitution of 1791. During these two years, however, Robespierre's most important activity was not in the Assembly, but in the Jacobin Club. (See JACOBIANS.) He set about making himself the acknowledged head of the club, and the leader of the people of Paris. His triumph was made complete when the conservatives were forced to withdraw from the club and organize themselves as the Feuillants (q.v.). His success in winning the Parisian populace to his support was demonstrated on September 30, 1791, at the adjournment of the Constituent Assembly, when he and Pétion were crowned by the people as the true and incorruptible patriots. For a few months he held the office of public prosecutor, which he resigned because of the Girondist attacks. In his defense he started a journal called *Le Défenseur de la Constitution*, continued as *Lettres à mes Committants* after the opening of the Convention. Still the leading exponent of the radical views, he used his position in the Jacobin Club to antagonize the Girondists, especially in their war policy. Marat was opposing the war as contrary to the interest of the State; Robespierre's grounds were rather humanitarian. Though a demagogue who was daily swaying the people of Paris by his eloquence in the Jacobin Club, he was not a man of action, and remained quiescent while the bolder spirits like Danton and Santerre directed the movement of June 20 and of August 10, 1792, and it was only after the success of the latter day that he appeared at the city hall to take his place as a member of the Insurrectionary Commune. No direct guilt attaches to Robespierre for the great crime of the Parisian mob, the prison massacres of September; still he was at that moment the popular hero and leader, and was a few days later elected as the first Deputy from Paris in the new National Convention.

In the Convention Robespierre was the recognized leader of the radical popular party, now known as the Montagnards, and from the first was denounced by the Girondists as a bloodthirsty demagogue. Of great importance was his famous speech on the King's trial, in which he carefully and clearly stated the logical position of the Convention, and proclaimed: "Louis ought to perish rather than a hundred thousand virtuous citizens; Louis must die, that the country may live." By this speech and by his attitude throughout the trial Robespierre completely out-generated the Girondists, whom he forced to take what for them was an illogical position and vote for the execution of the King. His generalship, which took advantage of the mistakes and personal dislike of the Girondists, also won to his side Danton, Billaud-Varenne, and the other strong men of action. Though the French nation

seemed on the point of being destroyed by the foreign foe, the Girondists continued their idle debates, clung to dreams of an impossible federalism, and persisted in their bickerings and their personal attacks upon Robespierre and Danton. Danton and the men of action who had hitherto preferred the company of the Girondists lost patience and were ready to turn to Robespierre, whom they regarded as a fanatic, but not yet dangerous. Taking advantage of these circumstances, Robespierre in one of his characteristic speeches arraigned the Girondists on April 10, 1793. It was a struggle to the death, but its outcome was certain from the moment that Danton and his followers joined Robespierre. The coup d'état of May 31st and June 2d was the work of the men of action, but the victory was that of Robespierre.

Robespierre was not a member of the First Committee of Public Safety and was not one of the original members of the Second or Great Committee of Public Safety, but was chosen to replace Gasparin, who resigned July 27, 1793. With the other members he was continued on the Committee until his arrest exactly one year later on the fateful 9th Thermidor. The name of Robespierre has ever been almost synonymous with the Committee, and both Robespierre and the other members gave currency to the notion that he ran the Committee; but as a matter of fact, the other members were the workers and never allowed Robespierre to interfere with them, and finally overthrew him because he attempted to make his reputed control of the Committee a reality. Virtually the Great Committee of Public Safety (see FRENCH REVOLUTION) was a semi-official Ministry, of which Robespierre was Prime Minister without portfolio. He was the most valuable man on the Committee, for, though he did none of the routine work and rarely appeared at its sessions, he was the one member who was known outside of the Convention and who had a national reputation; he was the ideal patriot, the 'virtuous,' the 'incorruptible;' and under his ægis the steady, clear-headed, industrious men of action toiled quietly, relentlessly, successfully to save France from the foes and perils that beset her. The notion of Robespierre as a bloodthirsty demon who daily breathed forth threatenings and slaughter is a total misconception; the truth is that the Committee was convinced that the only way to accomplish its task of saving France was by a government of terror which should silence or destroy every foe of the nation. To the working members of the Committee like Carnot and Billaud-Varenne the Terror was simply a business affair; to Robespierre it was a necessary preparation for the reign of virtue foreshadowed in the Gospel according to Jean Jacques Rousseau, whose prophet he was. Robespierre was neither the dictator of the Committee nor yet its dupe. He consciously assumed his share of the responsibility for its acts, he defended its policies in set speeches in the Convention and before the Jacobin Club, and he personally carried through the Convention one of the acts which contributed most to make the Terror an orgy of blood: the decree of October 29, 1793, by which after a trial of three days it was made possible for the jury of the Revolutionary Tribunal to declare that they were convinced of the guilt of the accused even though they had not heard the defense.

Robespierre was the only member of the Committee who had a definite policy for the future, who dared to dream of and plan for better days for France. In personal life and principle a Puritan, in religion a deist, in all things a true believer in Rousseau, this he preached, for this he labored, and in preparation for this he would destroy the vicious. His notions were clarified by his disgust at the follies and nummeries of the Worship of Reason, and by his abhorrence for the members of the Commune of Paris who were the authors of violent and evil measures. At these men, Hébert (q.v.) and his fellows, he would strike the first decisive blow. With the aid of Camille Desmoulins and Danton, who also detested the extravagances of the Hébertists, he was able to send Hébert and eighteen others to the guillotine after a trial that was a parody of justice. Danton, Camille Desmoulins, and the Dantonists were the next victims, because they laughed at the notions of Rousseau, because they saw that the Terror had done its work and that the time had come to exercise clemency, and because Danton was a possible rival to be feared both by Robespierre and by the Committee. On April 5, 1794, Danton perished, a victim of his own greatness, and of the injustice and fanaticism of his enemies—the men who were most indebted to him. After the death of Danton and his friends, the work of destroying the victims went on more rapidly, and after Couthon had carried the outrageous decree of June 10th accelerating the procedure of the Revolutionary Tribunal, 200 victims a week were sacrificed to the guillotine. In the meantime Robespierre was busy inaugurating his reign of virtue by instituting the Worship of the Supreme Being. On May 7th he delivered his famous speech in the Convention on the relation of religion and morality to republican principles, after which the Convention decreed a festival of the Supreme Being, which took place on June 8th with Robespierre, then president of the Convention, acting as the pontiff of the new religion.

One more hecatomb of victims would clear away the remaining leaders who stood in the way of the reign of virtue. At these, some of whom were his associates in the Committee or in the Convention, Robespierre planned to strike. But it was one dreamer against twenty men of action, and the dreamer failed. After a prolonged absence from the Convention and the Committee, Robespierre appeared in the Convention on July 26, 1794, and delivered one of his carefully prepared speeches intended to preface and justify the destruction of his foes. The next day Saint-Just, his fearless and vigorous supporter, appeared in the tribune to secure the passage of the measure of proscription. Stormy scenes followed, but at last the intended victims, Barras, Tallien, and the men of action from the Committee, with the skillful aid of Barère (q.v.), secured the arrest of Robespierre, and his younger brother Augustin, Couthon, Saint-Just, and Le Bas. All was not over, however, for Henriot with the National Guards of Paris rescued Robespierre and his friends and installed them at the City Hall. Had Robespierre been able to decide quickly and act quickly, he might still have won; but indecision and inactivity gave his foes time to act and to attack him in the City Hall. In the affray Robespierre shot himself or was shot in the jaw, his brother leaped from the window and

broke his leg, and Le Bas committed suicide. The Convention reassembled and declared Robespierre and his friends and Henriot and the members of the Commune of Paris outlaws. This was the famous Revolution of the 9th Thermidor. On the next day these men were all brought before the Revolutionary Tribunal and identified and immediately guillotined.

Robespierre's private character was above reproach, his manners, dress, and tastes were those of a gentleman of the Ancien Régime; his oratory depended for its success upon his elaborately finished style, upon his logic, and above all upon his earnestness, on several occasions he manifested a political ability of no mean order. Equipped as a philosopher of the Ancien Régime, he came upon the field after the slay of philosophizing had passed and when the day of action had dawned. For this reason he labored and in his fall dragged a multitude to destruction.

BIBLIOGRAPHY. Hamel, *Histoire de Robespierre* (Paris, 1865-67), is the authoritative work, though inclined to be eulogistic. Auclair, *Les orateurs de la législature et de la convention* (Paris, 1885-86), deals with Robespierre as an orator, while his most important speeches are published in Morse Stephens, *Principal Speeches of the Orators and Statesmen of the French Revolution* (Oxford, 1892). Consult, also, Beloe, *Robespierre* (London, 1902).

ROBIN (originally a quasi proper name), or **ROBIN REDBREAST**. A name given affectionately in the first instance to a familiar little European song-bird, which especially endears itself to the people by coming around the house and barns in winter; and later applied to the most common and familiar of American thrushes, because of its friendly association with man, and its red breast. The European robin is technically a warbler, of the family Sylviidae. It is about 5.57 inches in length, and of a remarkably round, plump form. (See Plate of WRENs, WARBLERS, etc.) The general color is olive-brown, and the reddish-orange breast is a conspicuous characteristic, particularly of the male. The redbreast is a native not only of Europe but of the western temperate parts of Asia and of Northern Africa. In the northern parts of Europe it is migratory, but never congregates in flocks. The attachment of pairs seems to extend beyond the mere breeding season (early spring), and to be stronger than in most birds. The nest is made of moss, dead leaves, and dried grass, lined with hair, often placed a little above the ground in a bush or in ivy on a wall; the eggs, 5 to 7 in number, are white spotted with pale reddish brown. In winter the redbreast seeks the neighborhood of human habitations more than in summer, and becomes more bold and familiar. Its food ordinarily consists of worms, insects, and berries; and it readily becomes a pensioner at any door or window to which it is invited by the spreading of crumbs.

The American robin (*Mercula migratoria*) is the largest and most numerous of our thrushes, and closely related to the European blackbird (q.v.). It is 10 inches long, olive gray, the top and sides of the head black, the chin and throat white with black streaks, and the under parts orange. The female is of duller hues. Large flocks are to be seen in the Southern States in winter, where great numbers are killed for the

table. The robin is a lively bird and a general favorite. The nest is built in trees or on rafters, stumps, or fence-posts, of coarse grass and reeds, plastered internally with mud and lined with fine grasses. The eggs are 4 to 5 in number, uniform greenish-blue. Two broods are produced in a year. Its food consists chiefly of worms and insects, but it enjoys berries and fruit, and often makes sad havoc among cherries. The song of the robin, especially in the late afternoon or early evening, is very sweet and melodious, and it is a familiar friend on village lawns, where it searches for earthworms and cutworms with great zeal and cunning. A closely allied robin is found in Lower California, known as the Saint Lucas robin (*Merula coupinis*). It is much paler and a trifle smaller than the common robin. The Oregon robin (*Hesperocichla nutria*) is a nearly allied species, called in books the varied thrush. The under parts are orange-brown, but there is a broad black band across the breast. This species is abundant in the Pacific Coast region from Alaska to Mexico.

ROBIN ADAIR', called ALLEN AROON, or EILEEN AROON. A song based on the old Irish melody "Eileen Aroon," which dates back to the fifteenth or sixteenth century. The air has been repeatedly claimed by the Scotch and the Welsh, but is undeniably of Irish origin. Boieldieu introduced it into his *Dame Blanche*, and Beethoven arranged it for voices with pianoforte, violin, and violoncello (op. 108). Many songs were written to the old air, including Burns's "Phyllis the Fair," "Had I a Cave," and Moore's "Erin, the Smile and the Tear in Thine Eye."

ROBIN GOOD'FELLOW. A supernatural being belonging to English folklore and mentioned by Shakespeare and his contemporaries. According to *A Midsummer Night's Dream* Robin is described as zealous in performance of household tasks for the sake of favorites, but inclined to play tricks on those with whom he is offended, or merely for his own diversion. He is said to take numerous shapes, into which he changes himself at will. He can also appear as a fire, and in this latter aspect is identical with the imaginary being called Will o' the Wisp, or Jack o' Lantern. He is further identified with the fairy Puck, originally a term applied to elves in general. The conduct ascribed to Robin is not so much peculiar to his individuality as common to a class of similar spirits connected with the household, who were supposed to assist in domestic labors, such as cleaning the habitation, spinning, and weaving, and who received a sort of worship, being regularly provided with sacrificial offerings of food.

ROBIN HOOD. A legendary English outlaw. See HOOD, ROBIN.

ROBINS, BENJAMIN (1707-51). An English mathematician and military engineer, born at Bath. In 1728 he counted a dissertation by Jean Bernoulli, which attempted to establish Leibnitz's theory on the laws of motion, a victory which gained him considerable reputation. For some years he taught pure and applied mathematics, but later became an engineer, devoting himself to the construction of mills and bridges, and commenced the series of experiments on the resisting force of the air to projectiles, which has gained him much celebrity. In 1734 he

demolished, in a treatise entitled *A Discourse Concerning the Certainty of Sir Isaac Newton's Method of Fluxions*, the objections brought by Bishop Berkeley against Newton's principle of ultimate ratios. His valuable work, *New Principles of Gunnery* (1742), produced a complete revolution in the art of gunnery. In this Robins suggested two new methods for estimating the velocity of balls. He also discovered and explained the curvilinear deflection of a ball from a vertical plane. He wrote several dissertations on the experiments and was in 1747 awarded the Copley medal. In 1749 he was appointed engineer-in-general to the East India Company and planned the defenses of Madras. His mathematical works were collected after his death, and along with the details of his latest experiments in gunnery were published under the title, *Mathematical Tracts* (1761). Robins also revised and edited Anson's *Voyage Round the World* (1740-44), and contributed extensively to the *Transactions of the Royal Society*.

ROBIN SNIPE. A gunner's name locally applied to various red-breast shore birds, especially to the dowitchers (q.v.). See PLATE OF BEACH BIRDS.

ROBINSON, AGNES MARY FRANCES (Mme. Duclaux, formerly Mme. Darmesteter) (1857-). An English poet and essayist, born at Leamington, February 27, 1857. She studied at University College for seven years, devoting herself specially to Greek literature. In 1888 she married James Darmesteter, the Orientalist, remaining in Paris after his death in 1894. In 1901 she married Professor Duclaux, director of the Pasteur Institute. Among her works are: *A Hundred of Homocynckles* (1878); *The Crowned Hippolytus*, translation of Euripides (1881); *Arden*, a novel (1883); *Emily Brontë* (1883); *The New Arcadia* (1884); *An Italian Garden* (1886); *Songs, Ballads, and a Garden Play* (1888); *End of the Middle Ages* (1888); *Retrospect* (1893); *A Mediæval Garland* (1897); *Froissart*, in the "Grands écrivains français" series (1897); *Life of Rouan* (1897; in French, 1898); *La Reine de Navarre* (1900); *Grands écrivains d'outremanche* (1901). Much of her work is scattered through the *Revue de Paris* from 1898 onward.

ROBINSON, BENJAMIN LINCOLN (1864-). An American botanist, born at Bloomington, Ill. He graduated at Harvard in 1887, and studied at Strassburg and Bonn. In 1892 he was appointed curator of the Gray Herbarium at Harvard, and in 1900 became Asa Gray professor of systematic botany there. He is best known for his work of classification and as collaborator and editor of Gray's *Synoptical Flora of North America* (1878-97).

ROBINSON, BEVERLEY (1723-92). An American Loyalist, born in Virginia. He was the son of John Robinson, president of the Council of Virginia in 1734. He served as major under Wolfe at Quebec in 1759, and soon afterwards gained possession, through marriage with a daughter of Frederick Philippe, of large tracts of land in New York. At first he sided with the colonists against England, but, disapproving of the separation, he removed to New York in 1776 and organized the Loyal American Regiment, of which he became colonel. Later his property, together with that of his wife, was confiscated

by the State of New York. His country house was the scene of Arnold's preliminary arrangements for the surrender of West Point, Robinson himself being implicated in the plot. After the war he retired, first to New Brunswick and later to Thornbury, Eng., where he lived until his death.

ROBINSON, CHARLES (1818-94). The first Governor of the State of Kansas. He was born in Hardwick, Mass., studied for a time in Amherst College, and in 1843 graduated at the Berkshire Medical School. Six years later he accompanied an emigrant train across the plains to California. He settled in Sacramento, and remained there for two years working as a miner, as a restaurant keeper, and as editor of the *Settler's and Miner's Tribune*. In 1850 he was elected to the Legislature, in which he proved an able champion of the settlers, and also did much to prevent California from becoming a slave State. Returning to Massachusetts, he edited the *Fitchburg News* for two years, and in 1854 was chosen by the Emigrant's Aid Society to go to Kansas and help save that Territory for freedom. He quickly became the leader of the Free-State Party, and was made chairman of the Executive Committee and commander of the Kansas Volunteers. It was his policy to avoid any resistance to the United States Government, but to ignore the laws passed by the bogus pro-slavery Legislature of 1855. He took an active part in the 'Wakarusa War,' and in 1855 was a member of the Topeka Convention which drew up a free-State constitution. In the following year he was elected Governor under this Constitution, but was arrested on a charge of treason and usurpation of office. He was indicted by the Federal Grand Jury, but after an imprisonment of several months he was tried for usurpation, and, being acquitted, was released. Two years later he was reelected Governor by the Free-State Party; in 1859 he was again reelected under the Wyandotte Constitution, and in 1861 he became the first Governor of the State. He bequeathed most of his property to his wife, but stipulated that on her death it should go to the Kansas State University, which owes its existence very largely to their efforts. He published *The Kansas Conflict* (New York, 1892). Consult: Blackmar, *Charles Robinson* (Topeka, 1900); Spring, *Kansas* (Boston, 1885), in the "American Commonwealth" series.

ROBINSON, CHARLES SEYMOUR (1829-99). An American clergyman, born at Bennington, Vt. He studied at Williams College and at the Union Seminary, but completed his theological studies at Princeton in 1855. For five years thereafter he preached at the Park Presbyterian Church at Troy, N. Y., then removed to the First Presbyterian Church in Brooklyn and remained until 1868, when he took charge of the American chapel in Paris, which, during his term, he converted from a preaching station into an organized church. At the opening of the Franco-German War he left Paris, but returned for a few months following the suppression of the Commune in 1871 to reorganize what remained of the congregation. Returning to America, he served successively the Madison Avenue and the Thirteenth Street Presbyterian churches, New York. His works are chiefly of a religious char-

acter, though his travel and study in Egypt gave an archeological interest to *The Pharaohs of the Bible and the Exodus* (1887). It is as an editor of hymn collections that he is known outside his church connections. His successive hymnals, *Songs of the Church* (1862), *Songs for the Sanctuary* (1866), *Psalms, Hymns, and Spiritual Songs* (1874), and *Laudes Domini* (1884), have been widely used.

ROBINSON, EDWARD (1794-1863). An American biblical scholar, born at Southington, Conn. He graduated at Hamilton College, Clinton, N. Y., in 1816. Later he studied at Andover, Mass., and at Halle and Berlin. On his return to the United States he was made professor extraordinary of sacred literature at Andover; but in 1833 his health broke down and he moved to Boston, where he remained until 1837, when he was appointed professor of biblical literature in Union Theological Seminary. This office he continued to hold until his death. He twice traveled in Palestine, in 1838 and again in 1852, with the famous missionary the Reverend Eli Smith. The result of their first visit was published in a work entitled *Biblical Researches in Palestine and Adjacent Countries* (3 vols., Boston and London, 1841; German ed., Halle, 1841). The work was republished in 1856 with some additions after the second visit. He edited and translated *Buttman's Greek Grammar* (1823; 3d ed. 1851); *Gesenius' Hebrew Lexicon* (1836; 5th ed. 1854); *Greek and English Lexicon of the New Testament* (1836; 2d ed. 1847); *Greek Harmony of the Gospels* (1845; 2d ed. 1851); *English Harmony of the Gospels* (1846). He founded the *Biblical Repository* in 1831 and edited it for four years. In 1843 he established the *Bibliotheca Sacra*. Consult Hitchcock, *The Life, Writings, and Character of Edward Robinson* (New York, 1863).

ROBINSON, EZEKIEL GILMAN (1815-94). An American clergyman and educator, born at Attleboro, Mass., and educated at Brown University and at Newton Theological Seminary. After his ordination he preached at Norfolk, Va., until 1845, when he removed to Cambridge, Mass., but soon relinquished the active ministry and accepted the chair of Hebrew and biblical interpretation in the Western Theological Seminary at Covington, Ky. In 1859 he became pastor of the Ninth Street Baptist Church, Cincinnati, but three years later was appointed professor of theology in Rochester Theological Seminary and in 1860 was made its president. After twelve years of service he was called to the presidency of Brown University. In 1889 he retired from this post on account of age and impaired health. In 1893 he became professor of ethics and apologetics in Chicago University and continued there until his death. His eminence as a preacher and thinker placed him among the foremost in his denomination. During his residence at Rochester he edited the *Christian Review* from 1859 to 1864. He also published a revision of the English translation of Neander's *Planting and Training of the Christian Church* (1865); *Yale Lectures on Preaching* (1883); and a text book on ethics, *Principles and Practice of Morality* (1888).

ROBINSON, SIR FREDERICK PHILIPSE (1773-1852). An English general, son of the loyalist Boyerley Robinson, born at Philippe Manor, near

was educated in his native city and studied art in Paris under Drolling. In 1847 he was made head-master of the Government School of Art at Hanley, and in 1852-69 he was superintendent of the art collections of the Victoria and Albert Museum. During this time he carried out a system of loan exhibitions from the main museum through the provincial museums, and collected many of the art treasures of the institution. From 1882 until 1901 he was Her Majesty's Surveyor of Pictures. His works include: *Descriptive Catalogue of the Drawings of the Old Masters in the Collection of Malcolm de Pottallock* (1869); *A Critical Account of the Drawings of Michael Angelo and Raffaele in the University Galleries* (1870); and *Memoiranda on the Madonna dei Cavalcanti of Raffaele* (1878).

ROBINSON, JOHN CLEVELAND (1817-97). An American soldier, born in Binghamton, N. Y. He graduated at West Point in 1839, and served with distinction under Generals Taylor and Scott in the Mexican War. In 1853 and 1854 he served against the Indians in Texas, and in 1857 and 1858 was with the expedition sent out to Utah against the Mormons. When the Civil War broke out, he was in command of Fort McHenry at Baltimore, and prevented it from being seized by Confederate sympathizers. Afterwards he was engaged in the work of mustering in troops at Columbus, Ohio, and Detroit, Mich., and in September, 1861, became colonel of the First Michigan Volunteers. In the following April he was promoted to be brigadier-general, commanded a brigade at Newport News, and then was made a brigade commander in Kearny's division of the Army of the Potomac. He fought with that army in the Peninsular campaign, at Fredericksburg, Chancellorsville, Gettysburg, and in the battles of the Wilderness. At Spottsylvania Court House, while leading a charge of his division, he received a wound which necessitated the amputation of his left leg and thus incapacitated him from further service in the field. In 1872 he was elected Lieutenant-Governor of New York. In 1877 and again in 1878 he was chosen commander-in-chief of the Grand Army of the Republic, and in 1887 he was made president of the Society of the Army of the Potomac.

ROBINSON, LEUCIS (1810-91). An American political leader, born at Windham, N. Y. He received an academic education, and was admitted to the bar in 1832. In 1840 he removed to New York City, but in 1855 he gave up his law practice and retired to a farm in Chemung County. In 1859 as the Republican candidate, but with Democratic aid, he was elected to the State Assembly, and in the following year was re-elected. In 1861 he was elected State Comptroller on the Union Combination ticket by an unprecedented majority, and in 1863 was re-elected. Ten years later he was again elected Comptroller, this time on the Democratic ticket, but he resigned the next year to accept the office of Governor. In 1879 he was renominated for Governor by the Democratic Party, but, owing to the hostility of Tammany Hall, was defeated.

ROBINSON, ROBERT (1735-90). An English preacher and hymn-writer, born at Swaffham, in Norfolk. After attending two grammar schools, he was apprenticed (1749) to a London hair-dresser. He continued his education by himself; and, coming under the influence of Whitefield, he

began to preach. In 1761 he became minister at the Stone Yard Baptist Chapel in Cambridge, built a new church (1764), and drew large congregations. He lived at different villages in the neighborhood, where he augmented his small stipend by tanning and by trade in corn and coal. Though nominally a Baptist, Robinson was very liberal in his religious views, he became in 1764 a Unitarian. Robinson was a bold and racy preacher and writer. Among his works are: *A Plea for the Deity of Our Lord* (1776), the arguments of which he afterwards regarded as untenable; a translation from the French of Jacques Samin's *Sermons* (120 sermons, 1779; 5 vols., 1784); a translation of Jean Claude's *Essay on the Composition of a Sermon* (1778, 79); *A History of Baptists*, ed. by George Dyer, 1790; and many other miscellaneous pamphlets on theological questions and the slave trade. He also wrote several hymns, of which two are of great beauty: "Come Thou Fount of Every Blessing" and "Mighty God, while Angels Bless Thee." Consult: *Memoirs of Life and Writings*, by Dyer (London, 1796); and *Miscellaneous Works*, ed. with memoir, by Flower (Harlow, 1807).

ROBINSON, STUART (1814-81). A clergyman of the Presbyterian Church. He was born at Strabane, near Londonderry, Ireland, came to America, and was graduated at Amherst College in 1836. He studied at the Union Theological Seminary, Prince Edward, Va., and at Princeton Seminary before taking up his pastorate at Kanawha Salines, W. Va., in 1841. From here he removed to Frankfort, Ky., then to Baltimore, and in 1856 became professor of Church polity and pastoral theology in the Presbyterian Theological Seminary at Danville, Ky. In 1858 he assumed the pastorate of the Second Presbyterian Church in Louisville, Ky., and edited *The True Presbyterian*, a paper which was suppressed by the military authorities on the charge of the disloyalty of its editor, who thereupon removed to Toronto and remained there until the close of the war. In 1866 he was expelled from the General Assembly meeting in Saint Louis, as a member of the Louisville Synod that had adopted the 'Declaration and Testimony,' a paper protesting against the political deliberances of the five preceding General Assemblies as 'unwise, unconstitutional, and unscriptural.' In 1869 the Synod of Kentucky under his lead united with the General Assembly of the Southern Presbyterian Church and chose him their moderator. Later he was prominent in framing the constitution and promoting the success of the General Presbyterian Alliance. He published: *Slavery as Recognized in the Mosaic Civil Law, and as Recognized also and Allowed by the Abrahamite, Mosaic, and Christian Church* (1865), and *Discourses of Redemption* (1866).

ROBINSON, THOMAS (1852-96). An American landscape painter of the Impressionist School, born at Trachburg, Va. He studied under Carolus Duran and G6rmaine in Paris, and afterwards at Giverny with the Impressionist Monet. Upon his final return to America he devoted himself with great success to Delaware and Hudson River Canal scenery. Robinson was one of the foremost representatives of the Impressionist School (q. v.) in America, but such was the effect of his early training that he rendered form in a way easy to understand. His works are mostly in private

possession. Among the best known are: "A Bridge," "In the Sunlight" (1892), Grand Union Hotel, New York; "Washing Day," "On the Tow-Path," and "Afternoon Shadows" (1894); "West River Valley," and "October Afternoon," exhibited at the National Academy (1896). Robinson died in New York City, April 2, 1896.

ROBINSON, THERESE ALBERTINE LUISE (pen-name TALVI, composed from the initials of her maiden name) (1797-1870). A cosmopolitan authoress, daughter of Prof. Ludwig H. von Jakob. She was born at Halle, Germany, lived for a time with her father in Russia; married (1828) Prof. Edward Robinson (q.v.), the American biblical scholar; accompanied him to the United States, where she studied the languages of the aborigines. Mrs. Robinson wrote extensively both in English and in German. Among her publications are German translations (under the signature Ernest Berthold) of Scott's *Black Dwarf* and *Old Mortality* (1822); *Psyche, a volume of tales* (1824); a German translation of Serbian folk-songs (1825-26); *Charakteristik der Volkslieder germanischer Nationen* (1840); *Die Unschtheit der Lieder Ossians* (1840); *Die Colonisation von Neu-England* (1847); tales in German—*Heloise, Life's Discipline*, and *The Eriks*, translated into English by her daughter (1850-53); a volume of reviews, entitled *Historical View of the Languages and Literature of the Slavic Nations* (1850); *Fifteen Years, a Picture of the Last Century* (1870). Her *Gesammelte Norellen* appeared in two volumes in 1874.

ROBINSON, WILLIAM CALLYHAN (1834—). An American lawyer and educator, born in Norwich, Conn. He graduated at Dartmouth in 1854, and at the General Theological Seminary, New York City, in 1857, and was admitted to the bar in 1864. For some time he was lecturer and professor of law in Yale University. In 1895 he was elected dean of the law schools of the Catholic University of America, Washington, D. C. While practicing law in New Haven he had been judge of the City Court (1869-71), judge of the Court of Common Pleas (1874-76), and a member of the Legislature of Connecticut. His works include: *Elementary Law* (1882), a widely used text-book; *Law of Patents* (1890); and *Elements of American Jurisprudence* (1900).

ROBINSON, WILLIAM ERIGENA (1814-92). An Irish-American journalist and politician, born in Unagh, County Tyrone, Ireland. After obtaining a classical education, he emigrated to the United States. He graduated at Yale in 1841, then became associate editor of the *New York Tribune*, and from 1844 to 1848 was its Washington correspondent, writing under the non-deplorable of 'Richardieu.' He subsequently edited several other papers, and from 1854 to 1862 practiced law in New York. In the latter year President Lincoln appointed him assessor of internal revenue for the Third New York District, and after holding this office for four years, he was in 1866 elected to Congress, where by his determined advocacy he secured the passage in 1868 of a bill protesting abroad the rights of naturalized as well as native-born citizens. Previous to this (1847) he had taken an important part in organizing a movement for the relief of Ireland, during the great Irish famine, and had secured the passage of the bill sending the United States warship *Macedonia* with provisions to his

native land. He was reelected to Congress in 1880 and 1882.

ROBINSON CRUSOE. A romance by Daniel Defoe (1719), founded on the actual adventures of Alexander Selkirk during his four years' residence in the island of Juan Fernandez. It is one of the most famous and at the same time most plausible of all stories of adventure, has been translated into several languages, and has enjoyed an undiminished popularity. For special study, the reprint edited by Austin Dolson (London, 1883), with a bibliography, may be mentioned.

ROB ROY. The popular name of Robert MacGregor or Campbell (1671-1734), a celebrated Scottish outlaw. He was born in Buchanan Parish, Stirlingshire, and was the second son of Donald MacGregor of Glengyle, by a daughter of Campbell of Glenneaves. In Gaelic, the name *Roy* signifies red, and was applied to him from his ruddy complexion and color of hair. Rob Roy assumed the maternal name of Campbell in consequence of the outlawry of the clan MacGregor by the Scottish Parliament. He received a fair education and in his youth was distinguished for his skill in the use of the broadsword, in which the uncommon length of his arms was of much advantage. Like many of the Highland proprietors of the period, he was engaged in grazing and rearing black cattle for the English market, but his herds were so often stolen by raiders that, to protect himself, he maintained a party of armed men, also protecting his neighbors' flocks, in return for which he levied a tax which went under the name of 'black mail.' By marriage he acquired the estates of Craig Royston and Invernaid, near the head of Loch Lomond. In consequence of losses incurred in unsuccessful speculations in cattle, for which he had borrowed money from the Duke of Montrose, his estates were seized by the Duke. Rendered desperate by his misfortunes, Rob Roy collected a band of about 20 followers, and made open war upon the Duke, sweeping away all the cattle of a district, and intercepting the rents of his tenants notwithstanding the vicinity of the garrisons of Stirling, Dumbarton, and Glasgow. His exploits have been immortalized by Sir Walter Scott in his novel *Rob Roy*, written in 1817. In 1722 he submitted to the authorities, and was imprisoned in Newgate, and in 1727 was sentenced to transportation to Barbadoes, but was relieved. He retired to Balquhider, where he died.

ROB'SART, AMY. A character in Scott's *Kenilworth*, secretly married to the Earl of Leicester. All was about to be revealed to Elizabeth during the revels at Kenilworth, when Amy was lured back to Cumnor Place, by Varney, the Earl's accomplice, and was killed by falling through a trap-door.

ROB'SON, STUART (1836-1903). An American comedian. He was born at Annapolis, Md., his real name being Robson Stuart. He made his debut at the Baltimore Museum in 1852, but though his part then was serious, his voice and manner unintentionally made it laughable, and he wisely determined to devote himself to comedy, in which he quickly met with success. His Captain Crosstree in the burlesque of *Black-Eyed Susan* is one of his best-remembered characters. In 1877 he made a hit in *Our Boarding House*

with W. H. Crane (q.v.) and the two established a partnership which lasted till 1889. They successfully revived several of Shakespeare's comedies, but their most popular production was Bronson Howard's play *The Henrietta* (1888-89). After parting with Crane, Robson starred in *The Henrietta*, *She Steeps to Conquer*, *The Meddler*, and other pieces. He died April 29, 1903. Consult: McKay and Wingate, *Famous American Actors of To-Day* (New York, 1896); Strang, *Famous Actors of the Day in America* (Boston, 1900).

ROBUSTI, rô-bus'tê, JACOPO. See TINTO-RETTO.

RO'BY, HENRY JOHN (1830—). An English educator, born at Tamworth. He was educated at Bridgworth, and Saint John's College, Cambridge, where after his graduation he was tutor and lecturer from 1853 until 1861. There he published *Remarks on College Reform* (1858). Afterwards he was master at Dulwich College for four years, and from 1866 until 1868 he was professor of jurisprudence at University College, London. In 1890-95 he was a member of Parliament from Eccles. His works include a *Grammar of Latin Language* (1871-74) and an *Introduction to Justinian's Digest* (1884), a very valuable work.

ROC (Ar. rukhkh, from Pers. rukh, hero, rhinoceros, roc). A marvelous bird of Arabic legend. It was so large that it could easily carry off elephants, and Sindbad the Sailor records his coming upon the egg of the bird, measuring 50 paces in circumference. The home of the monster was localized in Madagascar, and this gives a clue to one of the roots of the tradition. That island was the home of a large prehistoric bird (the *Aepyornis*, q.v.), of which fossil eggs have been discovered, measuring 13 inches in length. In the Babylonian mythology the storm-god Zu was represented in the form of a bird, the idea arising from the bird-like masses of clouds gathering at the storm. Like traditions of such a cosmical bird are to be found in Indian, East Indian, Persian, and Egyptian mythology. Consult: Yule's notes to his *Marco Polo* (London, 1871); and Lane's *Arabian Nights* (ib., 1838-40).

RO'CA, JULIO A. (1843—). A South American statesman, President of Argentina. He was born at Tucuman. In 1880 he was elected to the Presidency by the Federalist Party, but had to terrorize Buenos Ayres and Corrientes before he could enter on his administration, in which the currency was debased and the national debt greatly increased. He was succeeded by his brother-in-law, Juarez Celman (q.v.), in 1886, who was soon displaced by Pellegrini, and under this reformer Roca held a Cabinet post. In 1895 he became Vice-President and at the next election was chosen President for the term 1898-1904.

ROCAMBOLE (*Allium scorodoprasum*). A North European plant closely related to, larger than, and resembling garlic in habit, like which it is sometimes cultivated and used.

ROCH, rôk, SAINT (c.1295-c.1327). A popular saint of the French Church, the patron of those sick of the plague, and specially honored by physicians and hospitals. He was born of noble family at Montpellier. He undertook a pilgrimage to Rome at a time when pestilence

was raging in Italy and devoted himself to the care of the sick in different places. At Piacenza he was himself smitten and dragged himself to a neighboring forest, where a dog is said to have brought him food daily till his recovery. He returned to Montpellier, where he was thrown into prison as a spy, and died about 1327. His day is August 16th.

ROCHAMBEAU, rô-shân-bô', JEAN BAPTISTE DONATIEN DE VENDOR, Count de (1725-1807). A French soldier, born July 1, 1725, at Vendôme, where his father, a general in the French Army, was Governor. He was educated for the Church at Blois, but in 1742 became a colonel in the army. He distinguished himself in the War of the Austrian Succession, and at its close had attained the rank of colonel. In 1749 he succeeded his father as Governor of Vendôme. He commanded his regiment in the Minorca Expedition of 1756, distinguished himself in the capture of Port Mahon, was promoted to the rank of brigadier-general, and served with credit in the campaigns of the Seven Years' War in Germany. In 1769 he became inspector-general of the French Army and in 1780 lieutenant-general. In the latter year he was sent at the head of 6000 French regulars to cooperate with Washington against the English in America, and landed at Newport on July 10th. The French fleet under De Ternay, which had accompanied Rochambeau's army, was soon afterwards blockaded in Narragansett Bay, and Rochambeau, unwilling to abandon De Ternay, was kept inactive in Rhode Island for an entire year. Rochambeau's forces left Rhode Island in July, 1781, marched across Connecticut, and joined Washington on the Hudson. On August 19th the combined forces began their famous southward march to Yorktown, where they joined Lafayette's little army by September 18th. On October 19th Cornwallis was forced to surrender. During the entire campaign Rochambeau placed himself wholly under Washington's command, and, according to his instructions, acted as though his troops were simply a part of the American army. In recognition of their services Congress voted the thanks of the nation to Rochambeau and his troops. Returning to France early in 1783, Rochambeau was appointed Governor of Peadry and Artois, and in 1791 was made a marshal. He was in sympathy with the Revolutionary movement in France at the outset, and for a time was commander of the Northern Army, but the excesses of the Revolutionary leaders caused him to retire in disgust in July, 1792. He was imprisoned during the Reign of Terror, and only escaped the guillotine by the fall of Robespierre in 1794. Subsequently he was released and was restored by Napoleon to his rank and estates. He died at Thové, May 10, 1807. He published *Memoires militaires, historiques et politiques de Rochambeau* (Paris, 1809). A part of the first volume, translated into English by M. W. E. Wright, was published under the title *Memoires of the Marshal Count de Rochambeau Relative to the War of Independence of the United States* (1838). Rochambeau's correspondence from his arrival at Newport to the close of the Virginia campaign has been printed in Daniel, *Histoire de la participation de la France à l'Établissement des États Unis d'Amérique*, vol. v. (Paris, 1892). A brief anonymous work entitled *Journal*

des opérations du corps français sous le commandement du comte de Rochambeau, which has been translated into English and published in several forms, has been attributed to him, and he is supposed to have inspired if not actually collaborated in the work of François Soulé, *Histoire des troubles de l'Amérique anglaise* (Paris, 1787).

ROCH'DALE. A manufacturing town in Lancashire, England, 11 miles north-northeast of Manchester (Map: England, D 3). The parish church dates from the twelfth century. There is a free grammar school founded in 1565. The town hall is a fine building. Rochdale is noteworthy in economic history as the scene of the first successful experiment in coöperation. (See **ROCHDALE PIONEERS**.) Woolen manufactures were introduced by a colony of Flemings in the reign of Edward III.; cotton is manufactured and there are a number of iron foundries and machine works. There is a considerable trade in coal and stone. Rochdale is mentioned in Domesday as *Kecclam*. Its first charter was granted by Richard I. John Bright was a native of Rochdale; a bronze statue to his memory is one of the town's monuments. Population, in 1891, 76,160; in 1901, 83,100. Consult: Fishwick, *History of Rochdale* (Rochdale, 1889); Matley, *Annals of Rochdale* (ib., 1899).

ROCHDALE PIONEERS (Rochdale Society of Equitable Pioneers). An organization of flannel weavers of Rochdale, Lancashire, England, founded in 1844, the first to attain distinction in the coöperative movement. There were 28 members, each subscribing for one share of stock, a total of £28, and this not all paid in. The second year there were 74 members and a capital stock of £181. A small store was opened and the necessities of life sold to members almost at cost. Within twenty-five years the society had a membership of over 5560 and a stock of £81,232. The small store expanded into numerous shops and manufactories, and a hospital, reading rooms, a large library, and classes in arts and sciences were established. The store was managed in the name and for the advantage of the working-class purchasers. The town savings bank failed soon after the organization of the company, which thereupon practically took the place of the bank. During the early years the promoters served without recompense, but afterwards salaried officials were employed. The profits were divided. After paying all expenses and a dividend of 5 per cent. on the capital stock, 2.5 per cent. of the balance was allotted to the educational fund, and the remainder was distributed among the members in proportion to their purchases. The society has not only been a great success, but it has stimulated the coöperative movement throughout England. Consult: Jones, *Coöperative Production* (Oxford, 1894); Holyoake, *The History of Coöperation in Rochdale* (London, 1879); Potter, *The Coöperative Movement* (ib., 1891). See **COÖPERATION**.

ROCHE (Fr., rock), **ROCK ALUM**, or **ROMAN ALUM**. A potash alum originally from Civita Vecchia, Italy, near where it is said to occur native, but also made from alunite, and highly prized by dyers owing to its freedom from iron sulphate. The name is also frequently given to common alum artificially colored, as by Armenian bole or Venetian red.

ROCHE, Sir **BOYLE** (1743-1807). An Irish politician. In early life he entered the army, and saw service in America. He sat in the Irish Parliament from 1777 until the Union, uniformly supporting the government, in return for which he was made a baronet and received a pension. He contributed not a little to the bringing about of the Union; but his fame chiefly rests upon his reputation as an inveterate perpetrator of 'bull's' of the true Irish variety.

ROCHE, **JAMES JEFFREY** (1847—). An American poet and journalist of Irish stock. He was born in Montmellick, Queens County, Ireland. In his infancy his parents emigrated to Prince Edward Island, where he was educated in Saint Dunstan's College. In 1866 he went to Boston, Mass., where he engaged in commerce and in 1883 joined the editorial staff of the *Pilot*, then edited by John Boyle O'Reilly. In 1890 Roche became its editor-in-chief. His writings include: *Songs and Satires* (1887); *Ballads of Blue Water* (1895); *The Vase, and Other Bric-a-Brac* (1900); *Life of John Boyle O'Reilly* (1891); and *The Story of the Filibusters* (1891).

ROCHE, rôsh, **TROILUS DE MESGOCAT**, Marquis de la. A French explorer and colonizer, born in Brittany, France, about the middle of the sixteenth century. In 1598 he bargained with Henry IV. to colonize New France. He was made lieutenant-general of Canada, Hochelaga, Newfoundland, and Labrador, and of the adjacent countries "not possessed by any Christian prince." Having gathered an expedition largely composed of convicts from the prisons, in 1598 he set sail with these in a small vessel and explored the country about the mouth of the Saint Lawrence. Upon Sable Island he left the convicts, 40 in number, intending to transfer them afterwards to the mainland, but his vessel was driven by a tempest back to France, and it was not until 1603 that the 12 survivors were taken off by Chef-d'hôtel. Consult: Champlain's *Voyages*, in vol. viii. of the *Publications of the Prince Society* (Boston, 1878-82); and Parkman, *Pioneers of New France* (ib., 1865; later ed. 1897).

ROCHEFORT, rôsh'fôr'. A fortified seaport and naval arsenal in the Department of Charente-Inférieure, France, on the right bank of the Charente, nine miles from the sea, and 18 miles southeast of La Rochelle (Map: France, E 6). It is surrounded by ramparts, and protected by forts at the mouth of the river, and is a clean, well-built town. The harbor is one of the three largest in France. Rochefort has fine wharfs, extensive magazines, dock-yards, cannon foundries, and large bread and biscuit stores. The most celebrated of its many institutions are the marine hospital, founded in 1787, and the general civil college. Shipbuilding is the most important industry, and some furniture is manufactured. Rochefort's rise from a fishing village dates from 1666, when Louis XIV. chose it for a naval station and Vauban planned its fortifications. While waiting at the neighboring Ile d'Aix for a chance to escape from Rochefort to America, Napoleon surrendered to the British. Population, in 1901, 36,458.

ROCHEFORT, **VICTOR HENRI**, Count de Rochefort-Lincay (1830—). A French journalist and politician, born in Paris. He was educated at the College of Saint-Louis and shortly after his

graduation he found employment in a Government office. In 1863 Rochefort became one of the editors of the *Figaro*, and in 1866 began a series of mordant attacks on the Napoleonic Government which aroused the hostility of the authorities until the publisher dropped Rochefort from the editorial staff. The repeal of the most arbitrary restrictions on the press in 1868 enabled Rochefort to start *La Lanterne*, a weekly which soon obtained an immense circulation. Convicted of disrespect toward the Government and sentenced to a year in prison, a fine of 10,000 francs, and deprivation of civil and political rights, Rochefort escaped to Brussels, where he continued the publication of *La Lanterne*. In 1869 he was elected to the Legislative Assembly. He showed himself as hostile as ever to the Government; published *La Marseillaise*, and was again sent to prison, but on the downfall of the Empire he regained his liberty and was for a short time member of the Government of National Defense. After the capitulation of Paris, January, 1871, he founded *Le Mot d'Ordre*, which defended Gambetta's policy. He believed that Thiers was unfriendly to a republic, and threw in his lot with the Commune. Rochefort was arrested, tried, and in 1873 sent to the penal colony of New Caledonia. He escaped in 1874, returned and revived *La Lanterne* in Geneva. The general amnesty of July, 1880, permitted his return to Paris, where he established a journal named *L'Intransigeant*. He was elected to the Chamber of Deputies in 1885, but resigned the following year. In 1888 Rochefort played a prominent part in the political agitation caused by the movement in favor of General Boulanger, whom he earnestly supported, and with whom, in 1889, he suffered exile. He returned to Paris after the amnesty of 1895. He published *Les aventures de ma vie* (Paris, 1896).

ROCHEFOUCAULD, rôsh'fôw'kô'. See LA ROCHEFOUCAULD.

ROCHEFOUCAULD-LIANCOURT, rô'ân', kôw'. See LA ROCHEFOUCAULD-LIANCOURT.

ROCHEGROSSE, rôsh'grô's', GEORGES (1859-?). A French painter, born at Versailles. He was a pupil of Jules Lefèvre and Boulanger. His themes are generally historical, and he treats them in an emotional, naturalistic style, with a distinct reveling in the horrible. "Vitellius" (1882), "Andromache" (1883), "La Jacquerie" (1885), "The Fall of Babylon" (1891), and "The Death of the Emperor Geta" (1899) are examples of his energetic but sensational and often brutal painting. In quite another style and beautiful in color is his "Knight Among the Flowers" (1894, in the Luxembourg).

ROCHELLE, rô'shâl', LA. The capital of the Department of Charente-Inférieure, France, a seaport and first-class fortress, situated on a bay on the western coast, 290 miles by rail from Paris and 120 miles from Bordeaux (Map: France, E 5). It is a well-built town surrounded by a line of fortifications over three miles in circumference. Its harbor is one of the best on the coast. The most interesting building of the town is the town hall, dating from 1486-1607, with beautifully carved belltowers, a richly decorated exterior, and a statue of Guiron, Mayor of La Rochelle during the siege by Richelieu. The cathedral is a Grecian structure of the eighteenth century. Other interesting buildings are the ex-

change, the palais de justice, and the quaint houses of Henry II. The old episcopal palace now contains a library of over 46,000 volumes and about 1,000 manuscripts, and a picture gallery with paintings by Corot, Rousseau, and other modern French artists. There are a lycée, a theological seminary, a training school for teachers, an academy of art, an archaeological museum, and a botanical garden. The chief products are sardines, porcelain and glass wares, textiles, sugar, etc. There is some shipbuilding and trade in agricultural products and groceries. Population, in 1891, 26,808; in 1901, 31,359.

La Rochelle is first mentioned as *Rupella* in 981. It was fortified and endowed with some privileges by William IX, of Aquitaine, and its franchises were further increased with its passing under the rule of England, as a part of the dowry of Eleanor, wife of Henry Plantagenet. In 1224 Louis VIII, of France obtained possession of it. From the fourteenth century to the seventeenth La Rochelle had a representative form of government and occupied a prominent commercial position. As a stronghold of Calvinism it became a target for attacks both by land and by sea, and withstood a siege of six and one-half months by the Catholic army in 1573, which terminated in a treaty by which the Huguenots were granted liberty of worship. The activity of La Rochelle at the head of the Huguenot party provoked Cardinal Richelieu to crush the town. Accordingly, La Rochelle was invested by a strong army on August 15, 1627, and after a siege of over fourteen months during which two English fleets were repulsed by the besieging army and the population dwindled from 18,000 to 5,000, the town capitulated on October 28, 1628. Its fortifications were restored by Vauban, but the town never recovered its former importance. Consult Barbot, *Histoire de la Rochelle* (Paris, 1886-90).

ROCHELLE SALT. The popular name of the double tartrate of sodium and potassium, having the formula $KNaC_4H_4O_6 + 4H_2O$. It was discovered in 1672 by a Rochelle apothecary named Seignette. It occurs, when pure, in colorless transparent prisms, generally eight sided, and in taste it resembles common salt. It is prepared by neutralizing acid potassium tartrate with a hot solution of sodium carbonate. This salt is a mild and efficient laxative, less disagreeable to the taste than most of the saline purgatives.

ROCHESTER. A city and river port in Kent, England, on the right bank of the Medway, 26 miles east-southeast of London (Map: England, G 5). Together with Chatham (qv) and Strood, it forms one large town. The celebrated cathedral is 306 feet long. The nave and crypt are Norman, and the choir and transepts early English. The castle, crowning an eminence, is a solid and massive Norman keep. In 1883 it was purchased by the city, and its grounds were turned into a public garden overlooking the Medway. The city owns water works, markets, and a library, and provides for technical education. There are naval and military establishments in the city, and manufactures of oil and oil cake, of agricultural implements, and traction engines. Rochester is the ancient Durobriva. The bishopric of Rochester was founded in 604. Population, in 1901, 30,-

600. Consult Palmer, *Rochester Cathedral* (London, 1897).

ROCHESTER. A city in Strafford County, N. H., 32 miles southwest of Portland, Maine, on the Cochecho River, and on the Boston and Maine and the Portland and Rochester railroads (Map; New Hampshire, K 8). It has a public library. The annual fair held here is very largely attended. Shoes, woolen goods, brick, and lumber products constitute the most important manufactures. Excellent water power for the various establishments is derived from the Cochecho River. The population, in 1890, was 7396; in 1900, 8466. Rochester was incorporated as a town by royal charter in 1722, but was not settled until six years later. In 1891 it was chartered as a city. Consult McDuffee, *History of the Town of Rochester* (Manchester, N. H., 1892).

ROCHESTER. The county-seat of Monroe County, N. Y., and the third largest city of the State, 69 miles east by north of Buffalo (Map; New York, C 2). It is situated seven miles from Lake Ontario, and is nearly bisected by the Genesee River, which flows through a deep, precipitous gorge in the northern part of the city. In three falls and several rapids it makes a total descent of 257 feet within the municipal limits. The upper falls, 95 feet high, are near the centre of the city. Ten bridges span the river, one of which is 212 feet high and 990 feet long. The aqueduct (848 feet long and 45 feet wide) by which the Erie Canal crosses the river is also a noteworthy engineering feature. Among the railroads that enter Rochester are the New York Central and Hudson River, the West Shore, the Erie, the Lehigh Valley, the Pennsylvania, the Rome, Watertown and Ogdensburg, and the Buffalo, Rochester and Pittsburg.

The site of the city is level and elevated, its altitude being about 500 feet above the sea and 263 feet above Lake Ontario. Its total area is 18 square miles. Rochester is well laid out. The streets are broad and regular, and in the residential district are very beautiful. Here the detached residences, the abundance of shade trees, and lawns and gardens are well worthy of note. The total mileage of streets is about 325, of which 126 miles are paved, asphalt, granite, and Belgian blocks and macadam being mostly used. The parks and cemeteries are of special interest. In addition to a number of small parks and squares in various parts of the city, there are the Genesee Valley Park, the largest in area (340 acres), the East and West Seneca, and Highland parks. The Genesee Valley Park and Seneca Park are on the Genesee River, the latter being situated on both banks. They are noted for their wild picturesqueness. In Seneca Park (East) are zoological gardens. Highland Park has an extensive collection of low-growing trees and shrubs. Washington Square contains the Soldiers' and Sailors' Monument. The public park system includes 692 acres. Among the cemeteries, the most noteworthy is Mount Hope, established in 1838. Frederick Douglass is buried here. A statue to his memory was erected in 1898 in one of the city squares. Many charming summer resorts on the shore of the lake are connected with the city by electric roads, as well as by splendid driveways. The street railway system now reaches considerably beyond the city limits, and plans have been projected for its

extension as far as Syracuse to the east and Niagara Falls and Buffalo to the west.

The court-house, of granite, completed in 1896, is prominent among the public buildings. Other structures of note are the city hall, the post-office, the Chamber of Commerce, the State arsenal, the Powers Hotel, the Powers Building, the Masonic Temple, the Free Academy, the East Side and West Side High Schools, the Genesee Valley Club House, the Wilder Building, the German-American Building, and the Granite Building. There are a number of charitable and penal institutions. The Western New York Institution for Deaf Mutes is here, as are also a State Industrial School and a State Hospital for the Insane. Besides the Monroe County Penitentiary and the County Almshouse, there are many private charities, among which may be mentioned the Old Ladies' Home, hospitals, asylums, etc. Rochester is the seat of the University of Rochester (Baptist), opened in 1850, Rochester Theological Seminary (Baptist), opened in 1851, and Saint Bernard's Seminary (Roman Catholic), opened in 1893. The University of Rochester and the Rochester Theological Seminary, though under the same denominational control, have no direct relation with each other. The Wagner Memorial College is the most prominent of the schools for secondary education. The Mechanics' Institute, founded in 1885, is similar in scope to the Armour Institute of Chicago. It has been recently installed in a new building, costing \$250,000. Its students number more than 4000. The Reynolds Library with more than 50,000 volumes, the Central Library with 35,000, and the Law Library with 21,000, are the largest collections of books in the city, aside from those belonging to the educational institutions.

Rochester is primarily a manufacturing city. It is, nevertheless, the distributing centre for a highly productive agricultural section, and carries on considerable lake commerce through its port, Charlotte, on Lake Ontario at the mouth of the Genesee. The foreign trade of the Genesee customs district in 1901 was valued at \$2,123,000, of which more than \$1,280,000 was exports. The immense water power afforded by the Genesee River at this point has given Rochester the name 'Power City.' This natural advantage has contributed largely to the industrial prominence of the city. The water power is electrically developed. In 1901 these works were equipped to furnish 30,000 horse power, and a considerable expansion of the system was then in prospect. Once noted for its extensive flour-milling interests, Rochester now is best known for its production of photographic apparatus and optical instruments, though the output of these is less in value than that of several other of its many industries. It is widely known also for its extensive nurseries, some fifty establishments being in the city and vicinity. In the census year 1900, capital to the amount of \$49,086,000 was invested in the various manufacturing industries. The value of the products was \$69,130,000. Rochester is third in importance among the industrial cities of the State. The leading manufactures are men's clothing, boots and shoes, foundry and machine shop products, tobacco, cigars and cigarettes, flouring and grist mill products, malt liquors, furniture, photographic apparatus and materials, and optical goods. There are also in

Rochester several concerns that rank among the largest in the world in their respective lines. These include a preserving establishment, a button factory, lubricating oil works, a cider and vinegar plant, and a manufactory of folding box machinery.

Rochester is a city of the second class and as such is governed under the regular charter provided by legislative enactment. This charter became operative on January 1, 1900. The government is vested in a mayor and common council elected every two years, and in various administrative departments, for further explanation of which see paragraph on *Administration* under ALBANY. The comptroller, treasurer, police justice, assessors, and supervisors are chosen by popular election; other officials are appointed by the mayor. The city clerk is elected by the common council. The city spends annually for maintenance and operation about \$2,916,350, the principal items being: schools, \$703,285; interest on debt, \$319,000; municipal lighting, \$225,000; the fire department, \$244,387; the police department, \$204,800; streets, \$190,000; ash and garbage removal, \$111,000; water-works, \$110,000; charitable institutions, \$95,000. The net debt of the city in 1902 was \$10,246,018; the assessed valuation of real and personal property, \$116,448,973. The water-works, which have cost \$7,463,129, are owned and operated by the municipality. There are in all 348 miles of mains. Two systems are in operation—a gravity system for drinking-water, deriving its supply from lakes some 30 miles south of the city, and a direct pumping system taking water from the Genesee River. The direct system is used for manufacturing purposes, for the fire department, etc. These works have a daily capacity of 7,000,000 gallons. In connection with the gravity system are a storage reservoir and a distributing reservoir, possessing capacities respectively of 63,500,000 and 22,500,000 gallons.

The population of Rochester, in 1820, was 2063; in 1850, 36,403; in 1870, 62,386; in 1880, 89,366; in 1890, 133,896; in 1900, 162,698. The total, in 1900, included 40,748 persons of foreign birth and 601 of negro descent.

Rochester was permanently settled in 1810 on land owned by Nathaniel Rochester, William Fitzlugh, and Charles Carroll, all of Maryland. The first frame dwelling house was built two years later. Until 1822 the village (incorporated in 1817) was known as Rochesterville, and in 1834 the city of Rochester was chartered. The opening of the Erie Canal in 1825 gave a great impetus to the growth of the place. Rochester was the centre of the Anti-Masonic excitement from 1826 to 1835, William Morgan having been a resident of the city before his abduction from Batavia. (See ANTI-MASONS.) In 1849 the famous 'Rochester Rappings' attracted widespread attention and gave rise to modern spiritualism in the United States. Before the Civil War, Rochester, being the home of Myron Holley and Frederick Douglass, was prominent in the anti-slavery struggle, and it was here that Seward, in 1858, made the famous speech in which he spoke of the impending 'irrepressible conflict between opposing and enduring forces.' Consult: Parker, *Rochester, A Story Historical* (Rochester, 1884); *History and Commerce of Rochester* (New York, 1894).

ROCHESTER. A borough in Beaver County, Pa., 25 miles northwest of Pittsburg; on the Ohio River, at its junction with the Beaver, and on railroads of the Pennsylvania system (Map, Pennsylvania, A 3). It has valuable advantages as an industrial centre, being situated in a district producing gas, oil, coal, fire clay, and building stone. The manufactures include glass (tumblers, cut glass, bottles), pottery, brick, stoves, flour, and lumber products. Population, in 1890, 3749; in 1900, 4688.

ROCHESTER, HENRY WILMOT, EARL OF (c.1612-58). An adherent of Charles I. and Charles II. For his part in the plot against the Long Parliament he was expelled from the Commons. In the Civil War he sided with the King, and defeated Waller at Roundway Down in 1643, and again in 1644 at Cropredy Bridge, but because of his intrigues and the hostility of Prince Rupert and of Lord Digby was deprived of his command. He retired to France and became an intimate friend of Charles II., whom he rescued several times by his skillful disguises. He was made Earl of Rochester in 1652, was very successful in diplomatic errands to the Continent, and took part in most of the Royalist plots against Cromwell.

ROCHESTER, JOHN WILMOT, second Earl of (1647-80). An English poet, wit, and courtier. He was born at Ditchley, Oxfordshire. He entered Wadham College, Oxford, when only twelve years old; and at fourteen, by titular privilege, was, with other persons of rank, made M. A. by Lord Clarendon. After traveling in France and Italy, he became attached to the Court, and rose high in favor with Charles II., who made him one of the gentlemen of the bedchamber and comptroller of Woodstock Park. His wit and love of pleasure made him a favorite of a dissolute court; he, however, incurred the displeasure of the King, and was committed to the Tower, for the forcible abduction of a celebrated beauty and heiress, Miss Mallett, who was rescued by her friends, but whom he subsequently married before he was twenty years old. He wrote prose and verse with facility, and Anthony Wood speaks of him as the greatest scholar among the nobility of his day; but as he grew older he gave less of his time to study, and more to wine and vicious companions. His health became undermined by excess and he died at the age of thirty-two. Bishop Burnet wrote an interesting account of his death under the title of *Some Passages of the Life and Death of John, Earl of Rochester* (1681), from which it appears that he sincerely repented his dissolute course. His published works include many love-songs, an elegant *Imitation of Horace on Lucilius, a Satire Against Man*, in which he is much indebted to Boileau, and an *Essay on Voluptu*.

ROCHESTER, LAURENCE HYDE, EARL OF (1644-1711). An English statesman, son of the historian Clarendon. He entered Parliament at the Restoration, acted on several diplomatic missions, and in 1679 became First Lord of the Treasury and Privy Councillor. In 1681 he was made Viscount Hyde. In the same year he negotiated the secret subsidy from France and in November became Earl of Rochester. On the accession of James II. he became Lord Treasurer. On account of his opposition to the King's Catholic policy, and for his stand as an English churchman, he

was dismissed in 1687, with a large pension. In 1689 Rochester was in ill favor with Mary owing to his support of the suggestion of a regency, but regained her favor by his later diplomacy, was readmitted to the Privy Council in 1692, and in 1700 became Lord Lieutenant of Ireland and practically Premier. After William's death Anne's trust in him was undermined by the Marlboroughs, and he returned to power again only in 1710. Rochester edited his father's *History of the Great Rebellion* (1702-04).

ROCHESTER, NATHANIEL (1752-1831). An American soldier and manufacturer, born in Westmoreland County, Va., whence he early removed to Granville County, N. C. Rochester was a member of the Committee of Safety in 1775, and of the Provincial Congresses in 1775 and 1776. During the Revolutionary War he superintended the manufacture of arms at Hillsboro, and at its close removed first to Philadelphia and afterwards to Hagerstown, Md. In 1802 with Carroll and Fitzhugh he bought the 'Hundred Acre Tract,' now in the centre of the city of Rochester. He removed to Dansville, N. Y., in 1810 and established a paper mill, and again removed to Bloomfield. In 1817 he was secretary of a convention at Canandaigua to urge the completion of the Erie Canal. In 1818 he removed to the village of Rochesterville (the future Rochester), which had been named in his honor. He succeeded in securing the passage of the bill creating the new county of Monroe in 1821. Consult Rochester, *Early History of the Rochester Family in America* (Buffalo, 1882).

ROCHESTER, UNIVERSITY OF. A collegiate institution at Rochester, N. Y., established in 1850 under Baptist auspices. Since 1900 women have been admitted as students. The work of the university is arranged in three courses—classical, philosophical, and scientific—leading to the bachelor's degree. In 1903 the students numbered 245 and the faculty 20. The campus and five buildings with equipment, including a library of 38,595 volumes, were valued at \$501,568; the college property was estimated at \$1,357,263; the endowment was \$765,000, and the income \$51,009.

ROCHE-SUR-YON, rôsh'sûr'yôx'. LA. The capital of the Department of Vendée, France, picturesquely situated on a hill on the right bank of the Yon, 38 miles south of Nantes (Map: France, E 5). It was a village of 800 inhabitants when Napoleon I. selected it for the capital of the department and named it *Napoléon-Vendée*. Its feudal castle was dismantled by order of Louis XIII. Its ruins formed a quarry for the building of the modern town for which Napoleon I. decreed an appropriation of 3,000,000 francs. There are an equestrian statue of Napoleon I. and a museum containing some good paintings. Population, in 1900, 13,629.

ROCHOW, rôk'ô, EBERHARD VON (1734-1805). A German philanthropist and educational reformer, born in Berlin. His military career having been cut short in the earliest campaigns of the Seven Years' War by wounds in each hand, he devoted himself to popular education, and in 1773 built a school at Re Kahn, and another at Krähne in 1799. In both he was greatly assisted by Bruns. Rochow favored State schools and compulsory attendance. His method, especially adapted for country schools, founded

on a fairly correct idea of the growth of the mental faculties, and urging that only the actually useful should be taught, was set forth in 1772 under the title *Versuch eines Schulbuches für Kinder der Landleute*, and the system was put into practice in his juvenile writings, of which *Der Bauernfreund* (1776) is best known. Rochow's correspondence was published by Jonas (Berlin, 1884) and selections from his works by Gausen (Paderborn, 1894). Consult Pohlisch, *Die pädagogischen Verdienste des Domherrn von Rochow* (Zwickau, 1894).

ROCK (AS. *rocc*, OF. *roc*, *roche*, Fr. *roche*, from ML. *roca*, *rocca*, rock; probably from Ir., Gael. *roc*, Bret. *roch*, rock). A portion of the solid earth. Rocks are composed of mineral matter, although some have an organic origin. In contrast with minerals they are more complex, being aggregates of minerals, usually, though not always, containing a number of different mineral species. This number may be ten or more, though in rare cases rocks represent a single mineral; and there are seldom more than two or three component minerals which are present in large quantity.

ROCKS CLASSIFIED GENETICALLY. As respects their origin rocks fall into three grand divisions, viz.: (1) Sedimentary, elastic, or aqueous rocks; (2) massive or igneous rocks; and (3) metamorphic rocks. Of these divisions the first includes the more diverse types and no single name has been found sufficiently comprehensive to include them all. The most abundant and widely distributed class within this division is that of the true sedimentary or elastic rocks, which are made up of sediment or detritus deposited in water. If laid down upon the ocean bottom rocks of this class are described as *marinc*, examples of which are mud-stones or shales (q.v.), and some limestones (q.v.); if deposited along shore, *littoral*, of which conglomerate (q.v.) and sand-stone (q.v.) are examples; and if deposited in lakes, *lacustrinc*, or if in streams, *fluvialile*, as, for example, silt. Water in the form of ice has likewise been largely instrumental in transporting and depositing rock materials such as gravel, sand, and clay. Again, water confined within the outer zone of the earth's crust through solution and subsequent deposition in crevices and other openings has produced the rocks known as veins (q.v.) or vein-stones, which, though comparatively small in bulk, are yet of great importance as the repository of the valuable metals. These are the aqueous rocks in the restricted sense. In arid regions the wind has been an important agent in transporting rock material and producing deposits which are designated *aeolian accumulations* (q.v.). Such a deposit is that of the loess (q.v.) of China.

Massive or igneous rocks are the product of consolidation from cooling of a molten mass or magma. The consolidation may have occurred below the earth's surface either in subterranean reservoirs— *batholites* (q.v.), *laccolites* (q.v.), or *bosses*—producing rock masses more or less equally developed as respects their several dimensions; or the consolidation may have occurred within a fissure forming a comparatively thin rock wall bounded by plane surfaces—*dike* (q.v.). In either of the above cases the rock formed is said to be of *intrusive origin*. If the molten mass reached the surface of the earth

before consolidation and was poured out either as a broad layer (sheet) or as a stream, the rock produced is described as of extrusive, effusive, or volcanic origin. See LUXURIOUS ROCKS.

The division of metamorphic rocks is composed of types developed from processes of alteration out of originally igneous or sedimentary rocks, but it includes not only those rocks which may be traced to the one class or the other, but also those the origin of which is in doubt. Together the several types of this division are described under the name crystalline schists, of which gneiss (q.v.), schist (q.v.), and phyllite are the most abundant members. See METAMORPHIC ROCKS.

Unaltered sedimentary rocks are further subdivided into those of mechanical, chemical, and organic origin. Of the first mentioned class are the greater number—the true sediments and the aeolian deposits. Sand and gravel, greensand, loess (q.v.), clay, breccia (q.v.), conglomerate (q.v.), graywacke (q.v.), and shale (q.v.) have this derivation. Of chemical origin are the siliceous sinters such as are to-day forming about the geysers in the Yellowstone National Park; the calcareous sinters of caverns in limestone, including stalactites, travertine (q.v.), veinstones, deposits of gypsum (q.v.), and limonite (q.v.), and the many rocks of concretionary structure known as oölite (q.v.). Of organic origin are chalk (q.v.), flint (q.v.), shell limestone, and chert (q.v.). Marl (q.v.), cement rock, lithographic stone (q.v.), and the several varieties of peat (q.v.) and coal (q.v.) have also an organic origin. The larger masses of compact limestone (q.v.) and magnesian limestone or dolomite (q.v.) are known to have an organic and generally also a marine origin, but the exact manner of their formation is a problem regarding which there are many opinions. The calcareous ooze which is now forming over the deep-sea bottoms is composed almost entirely of the tests of pelagic organisms, whereas such structures are found in the rocks only in chalk, a formation of comparatively rare occurrence. It has been suggested that the compact limestones which are so generally composed of crystals of calcite are produced from the resolution of the remains of these organisms now collecting upon the sea bottom, perhaps even at the bottom of the ocean in the layers beneath the deposit of ooze. It is certain that a deposit of compact limestone is forming directly from water in the Everglades of Florida; and it is inferred that this process is a more or less widely distributed one. Limestones may, however, form from the evaporation of an inclosed sea, as has happened in past geological ages within the area of the Western United States.

MECHANICAL SEDIMENTS CLASSIFIED ON BASIS OF COMPOSITION. The great class of mechanical sedimentary rocks are classified on the basis of their dominant constituent as arenaceous or siliceous rocks, argillaceous rocks, and calcareous rocks. The first mentioned rocks contain much quartz or silica; those of the second class abound in clayey material, the base of which is a silicate of alumina and hydrogen (kaolin or china clay) (q.v.), while the class of the calcareous rocks are essentially composed of carbonate of calcium, or of calcium and magnesium in the form of the minerals calcite, aragonite, or dolomite. Arkose, graywacke, sandstone, conglomer-

ate, sand, and gravel are the more abundant siliceous sedimentary rocks. Representatives of the argillaceous rocks are argillite or mud-tone, shale, clay, mud, and silt. Marl and calcareous shale are calcareous argillaceous sediments and form a transitional member connecting the argillaceous with the calcareous sedimentary rocks. Under the calcareous sediments are included limestone and dolomite, chert, etc. See ARGILLACEOUS ROCKS; ARGILLACEOUS ROCKS; CALCAREOUS ROCKS.

BIBLIOGRAPHY. Diller, "The Educational Series of Rock Specimens," *Bulletin* No. 170, *United States Geological Survey* (Washington, 1898); Kemp, *Hand-Book of Rocks for Use Without the Microscope* (New York, 1896); Harber, *Petrology for Students* (Cambridge, England, 1895).

ROCK BADGER, or ROCK RABBIT. See HYRAX.

ROCK BASS. A gamy and excellent bass (*Ambloplites rupestris*) of the Northern States and Mississippi Valley, called also 'red-eye' and 'goggle-eye.' It is a foot long, olive green, with a brassy tinge and much dark mottling, and a black spot on each scale, forming interrupted stripes, the young irregularly barred and blotched. These bass are found in clear streams and lakes, where they keep about rocks or smoken logs. See Plate of Bass.

ROCK BUTTER. A name given to a variety of the mineral halotrichite. It is a yellowish butter-like substance that is found as an efflorescence or exudation from some alum slates, notably those at Hurlet and Campsie, near Glasgow, Scotland, and at Rossville, Richmond County, N. Y. It is called also *mountain butter*. The name has likewise been applied to certain varieties of the mineral chrismanite.

ROCK-COCK. A South American bird, more usually called cock-of-the-rock (q.v.). It is a type of the genus *Ruficola*, but was formerly included among the related pipras.

ROCK-CRAB. An indefinite general name for a variety of crabs customarily living on rocky bottoms, as, along the New England coast, the Jonah crab. The name belongs rather to the family Cameridae, in which belong more common edible crabs than to any other group.

ROCK CRYSTAL. A colorless, transparent variety of crystallized quartz. The name is applied chiefly to the massive varieties, such as Brazilian pebble, which is used for lenses; but it also includes the small distinct crystals which are sold as imitations of the diamond and are called variously Bristol diamonds, Lake George diamonds, etc. The name is likewise sometimes extended to the violet variety of quartz or amethyst, to the red variety or Bohemian ruby or Silesian ruby, to the yellow variety or citrine or false topaz, and to the brown variety or smoky quartz. Specimens are sometimes found containing inclusions of hair-like or needle-like crystals of other minerals such as actinolite, asbestos, epidote, gähite, hornblende, rutile, tourmaline, etc., which are called variously by the names of *Cupid's arrows*, *Cupid's acts*, *Thetis's hair stone*, *Venus's hair-stone*, etc.

ROCK-DOVE. A wild dove of Western Europe (*Columba livia*). See PIGEON.

ROCKEFELLER, JOHN DAVISON (1839-). An American capitalist, born in Richford, Tioga

County, N. Y. When twelve years old he was taken by his parents to Cleveland, Ohio, where he was educated in the public schools, and at sixteen became a clerk in a commission house. In 1858 he embarked in the commission business himself with a partner named Clark. Both members of the firm were resourceful and clever at driving bargains, and their success was immediate. In 1862 they became associated with Samuel Andrews, an expert oil refiner, and, under the firm name of Andrews, Clark & Company, engaged extensively in the oil business. William Rockefeller, a brother, was admitted to partnership, and a new company, William Rockefeller & Co., was formed, which, in 1865, built, at Cleveland, a large refinery, known as the Standard Oil Refinery. The next extension was the formation of an eastern branch at New York, with Henry M. Flagler as an additional partner. In 1870 the several firms were combined under the name of the Standard Oil Company, with a capital of \$1,000,000. Of the combination John D. Rockefeller was the president and controlling spirit. From this time on all his energies were bent toward obtaining control of the oil business of the entire country. To accomplish this it was necessary to obtain control not only of the output of the oil fields, but of the means of transportation, and Rockefeller devised a systematic scheme of making arrangements with the railroads whereby the Standard Oil Company, by a system of rebates, should be given preferential shipping rates, that would, in time, render competition next to impossible. With this end in view a cooperative concern known as the South Improvement Company was organized, but so great was the opposition that it was soon dissolved, and less open methods to the same end were adopted. Gradually the Standard Oil Company absorbed or drove out of business most of its principal rivals, and its influence or alliance with the railroads became closer. In 1882 John D. Rockefeller organized the Standard Oil Trust, but after a ten years' existence it was dissolved. Since then the various companies have been operated separately, but all are under the management of Rockefeller, whose control of the oil business is as complete as though he had but one company to look after. In the intervals of a busy career Rockefeller found time to devote to religions, benevolent, and educational institutions, particularly those connected with the Baptist Church. In 1892 he founded and endowed the University of Chicago, the full title of which is "The University of Chicago, founded by John D. Rockefeller." To this institution in 1903 he had given in all more than \$6,500,000. He also gave largely to other institutions. His gifts for education, which aggregate a greater sum than has ever before been contributed by a single person to such purposes, have been mostly conditional upon the raising of a similar amount by the institution benefited.

ROCKET. See ARILLERY; PYROTECHNY; SIGNALING AND TELEGRAPHING, MILITARY; SIGNALS, MARINE.

ROCKET. See DAME'S VIOLET.

ROCKFISH. The name of a variety of fishes which haunt rocky places. In the Eastern States the term is applied to (1) the striped bass (*Roccus lineatus*), (2) the rock bass (q.v.), (3) the yellow-finned grouper (*Myctioperca ven-*

nosa) of Florida and southward, which is about three feet long and clear olive green, with light green and orange-brown markings, and (4) to a familiar killifish (*Fundulus majalis*).

On the Pacific Coast 'rockfish' is a general name for a large group of marine shore-fishes of the family Scorpenidae, of which about thirty genera and 250 species are known. Many bring forth their young alive, the fry at birth being about a quarter of an inch in length. The typical rockfishes of California are those of the genus *Sebastes*, of which 56 species are recognized by Jordan and Evermann, who monographed the group with much detail in their *Fishes of North and Middle America* (Washington, 1898). On the average they are about 15 inches long and weigh 2 or 3 pounds. Most of them are of brilliant hues, with striking markings. Nearly all of these fish are fair eating and furnish the principal part of the marine market supply of California. Consult: Goode, *Fishery Industries*, sec. i. (Washington, 1884); Eigenmann and Beeson, "Revision . . . of the Subfamily Sebastinae," in *Proceedings of the National Museum*, vol. xvii. (Washington, 1894); Jordan and Evermann, *American Game and Food Fishes* (New York, 1902). Compare ROSEFISH; GROUPEE.

ROCKFORD. A city and the county-seat of Winnebago County, Ill., 87 miles west by north of Chicago, on Rock River, here spanned by several bridges, and on the Chicago and Northwestern, the Illinois Central, the Chicago, Burlington and Quincy, and the Chicago, Milwaukee and Saint Paul railroads (Map: Illinois, C 1). It is divided by the Rock River and covers a total area of about eight square miles. In the eastern section are the handsome building and grounds of Rockford College for Women. A public library with more than 35,000 volumes occupies a fine structure, the gift of Andrew Carnegie. Memorial Hall and the City and Saint Anthony's hospitals are among other prominent features of the city. The Ransom Medical and Surgical Sanitarium is two miles distant to the north, and the Broughton Sanitarium is at the city limits on the south. Good water-power and excellent transportation facilities have contributed largely to Rockford's industrial and commercial importance. In the census year of 1900 there was invested in the various industries capital amounting to \$27,971,613. The total production was valued at \$48,871,596. Furniture, hosiery and knit goods, foundry and machine-shop products, agricultural implements, clothing, and harness constitute the leading manufactures. The government is vested in a mayor, chosen biennially, and a unicameral council. The city spends annually for maintenance and operation about \$378,000, the principal items being: Schools, \$105,000; streets, \$58,000; water-works, \$53,000; fire department, \$36,000; municipal lighting, \$22,000; interest on debt, \$20,000; police department, \$20,000. Rockford was settled in 1834, laid out in 1836, and chartered as a city in 1852. It was enlarged by the annexation of suburbs in 1890. Population, in 1890, 23,584; in 1900, 31,051.

ROCKFORD COLLEGE. An undenominational institution for the higher education of women at Rockford, Ill., founded in 1849. It had in 1902 property valued at \$173,000, with grounds and buildings worth \$135,000, an endow-

5. TREEFISH (*Sebastes serriceps*).
6. ROSEFISH (*Sebastes marinus*).

ment of \$123,976, and an income of \$21,324. Its library contained about 6000 volumes. The departments are collegiate, preparatory, music, and art, with a total attendance of 138 and a faculty of 20.

ROCKHAMPTON. A seaport town of Livingstone County, Queensland, Australia, on the Fitzroy River, 380 miles north of Brisbane by rail (Map: Australia, J 3). It is the outlet for a large portion of Central Queensland and the port of the Morgan gold field. It is a well-built town, with wide and shaded streets, fine government buildings, a town hall, botanical gardens, etc. A bridge 1160 feet long spans the river. Its harbor for ocean steamers is at Port Alma, 36 miles below, but vessels of 1500 tons ascend to the city. Population, in 1891, 11,629; in 1900, 15,461.

ROCK HILL. A city in York County, S. C., 80 miles north of Columbia, on the Southern and the Ohio River and Charleston railroads (Map: South Carolina, C 2). It is the seat of the Winthrop Normal and Industrial College of South Carolina, a State institution for women. Cotton, farm produce, and fruit are extensively cultivated in the surrounding district. Its industries include cotton mills, a large buggy factory, a flour mill, brick plants, sash, door, and blind manufactories, and foundries and machine shops. The city is the headquarters of the Catawba Power Company, which is electrically developing 8000 horse-power on the Catawba River, five miles distant. Population, in 1890, 2744; in 1900, 5485.

ROCKHILL, WILLIAM WOODVILLE (1854—). An American diplomat, traveler, and author, born in Philadelphia. In 1884 he was appointed second secretary of the American legation at Peking, the next year he was promoted to secretary, and in 1886 he was appointed chargé d'affaires in Korea. Between 1888 and 1892 he made two long journeys through China, Mongolia, and Tibet. In 1893-94 he was chief clerk in the United States Department of State, in 1894 he was appointed Third Assistant Secretary of State, and in 1896 was promoted to First Assistant Secretary. He was United States Minister to Greece, Rumania, and Servia from 1897 to 1899, when he became director of the Bureau of American Republics. His published works include: *Explorations in Mongolia and Tibet* (1893); *Diary of a Journey Through Mongolia and Tibet in 1891 and 1892* (1894); *The Land of the Lamas* (1891); *The Life of the Buddha and the Early History of His Order* (1884); *Notes on the Ethnology of Tibet* (1895); and *Report of W. W. Rockhill, Late Commissioner to China* (1901).

ROCK HIND. One of the groupers (*Epinephelus Adscensionis*), well known throughout the

ROCK HIND.

Western Atlantic and common in rocky places about all the West Indian coasts and islands, where it is known as 'abra mora,' and is re-

garded as the best market fish of its kind. It is about 18 inches long, clouded greenish gray, everywhere spotted with orange, and with five dark, roundish blotches along the back. See GLOBE.

ROCK-HOPPER. See PENGUIN.

ROCKINGHAM, CHARLES WATSON WENTWORTH, second Marquis of (1730-82). An English statesman. He was educated at Westminster School and Saint John's College, Cambridge. Belonging to an old Weng family, he received many honorary offices, and in 1750 succeeded his father in the peerage. In 1765 Rockingham was selected as Prime Minister, the chief men in his Cabinet being Conway, the Duke of Grantham, and the Duke of Newcastle. The Government was not a strong one, but it is famous on account of its repeal of the Stamp Act and the passing of other measures which conciliated the American Colonies. In 1766 the Ministry resigned and Rockingham for many years was an opponent of the King's policy and throughout showed friendship for America. On the resignation of Lord North in 1782 Lord Rockingham again became Prime Minister. The principal men this time in his Cabinet were Fox and Shelburne. Rockingham died on July 1st, within a little more than three months after his installation. Though not a man of great abilities, Rockingham was held in esteem by all, and his general acceptability was the cause of his selection on two occasions as Prime Minister. Consult: *Albemarle, Memoirs of Rockingham* (2 vols., London, 1852-53); *Lecky, History of England in the Eighteenth Century* (New York, 1878).

ROCKING STONES. Masses of rock so finely poised as to move backward and forward when pushed by the hand. They are generally formed of granite as being the stone that most easily resists general decomposition. The wearing away of the lower portions is usually the combined result of the sand-blast action of the wind and sand and the disintegrating action of frost or the effect of lichens which dis-integrate the felspar immediately below and contribute to the wasting of the rock. In ancient times rocking stones were used as a means of divination. Among the famous rocking stones is the Logan Rock, near the Land's End in Cornwall, whose weight is computed to be between 70 and 90 tons, and that at Island Magee, on Brown's Bay, County Antrim, Ireland, which is popularly believed to tremble or rock at the approach of sinners and malefactors. The largest rocking stone is that of Tandil, Argentine Republic.

ROCK ISLAND. A city and the county seat of Rock Island County, Ill., 180 miles west by south of Chicago, on the Mississippi River and the Hennepin Canal, and on the Chicago, Rock Island and Pacific and its Rock Island and Peoria branch, the Chicago, Burlington and Quincy, the Chicago, Milwaukee and Saint Paul, and other railroads. (Map: Illinois, B 2). It is the seat of Augustana College (Lutheran) opened in 1860, and has a public library with more than 11,000 volumes. On Government's Island, near the city, is the United States arsenal and armory, covering an area of nearly 1000 acres and costing about \$10,000,000. There are railroad and highway bridges from the city to the island, which in turn is connected with Downport, Iowa, by a fine highway and railway.

bridge south by the United States Government. A series of railroad bridge across the Mississippi connects the western parts of the two cities. An important railway centre, Rock Island also has large commercial and industrial interests. The dam in the Mississippi, constructed by the Federal Government, furnishes extensive water-power for manufacturing. The products of the various establishments include farm implements, stoves, brick, lumber, carriages, soap, beer, oilcloth, sashes, doors, and blinds. The government, under the revised charter of 1879, is vested in a mayor, elected every two years, and a unicameral council, and in administrative officials. Rock Island was settled in 1836, and was first incorporated in 1841. Population, in 1890, 13,634; in 1900, 19,493.

ROCKLAND. A city and the county-seat of Knox County, Maine, 60 miles south of Bangor, on an inlet of Penobscot Bay, and on the Maine Central Railroad and the Bangor and Boston steamboat line (Map: Maine, E 7). Among the features of the city are the public library of 6000 volumes, the United States Government building, and the county court-house. A large harbor and excellent shipping facilities contribute to Rockland's importance as a commercial centre. The city is noted for its extensive lime-burning works and shipbuilding yards, and has also manufactures of brick, carriages, and cigars. The granite quarries of the vicinity have furnished materials for United States Government buildings. Population, in 1890, 8174; in 1900, 8150. Originally a part of Thomaston and separately incorporated as East Thomaston in 1848, Rockland received its present name in 1850, and was chartered as a city in 1854. Consult Eaton, *History of Thomaston, Rockland, and South Thomaston* (Hallowell, 1865).

ROCKLAND. A town in Plymouth County, Mass., 18 miles south-southeast of Boston, on the New York, New Haven and Hartford Railroad (Map: Massachusetts, F 3). It has some manufactures, of which shoes, tacks, and nails are the most important. There is a public library with 10,000 volumes. Originally a part of the town of Abington of the old Plymouth Colony, Rockland was incorporated as a separate town in 1874. Population, in 1890, 5213; in 1900, 5327.

ROCK OF AGES. The title of a celebrated hymn written by Augustus Toplady in 1776.

ROCK PLANTS. Plants whose natural habitat is associated with areas of rock. With the exception of marine forms (see BENTHOS), rock plants may be classed generally under the head xerophytes (q.v.). Some authors hold that the calcareous elements of lime-stone determine one type of vegetation, and siliceous rocks another. Hence, rock plants have been divided into calcareous plants and siliceous plants. But most authors contend that the differences which arise are more closely connected with the physical structures and properties of the rocks than with their chemical features, since certain considerations indicate that neither the chemical nor physical properties directly determine all of the differences in distribution.

ROCKPORT. A town in Essex County, Mass., four miles northeast of Gloucester, on the Atlantic Ocean, and on the Boston and Maine Railroad (Map: Massachusetts, F 2). It has the Rockport and Pigeon Cove public libraries. The

village of Pigeon Cove, which comprises the northern part of the town, has some reputation as a summer resort. Rockport is engaged in agriculture and fishing, and is noted for its extensive quarries of granite. Isinglass is the leading manufactured product. The United States Government is constructing a breakwater which will greatly improve the harbor here. Population, in 1890, 4087; in 1900, 4502. First settled in 1697 and incorporated as a parish in 1754, Rockport formed part of Gloucester until 1840. It then became a separate town and received its present name in place of the former one, Sandy Bay. Consult Marshall, *History of the Town of Rockport* (Rockport, 1888).

ROCKPORT. A port and the county-seat of Aransas County, Texas, 159 miles southeast of San Antonio, on Aransas Bay, the terminus of the San Antonio and Aransas Pass Railroad (Map: Texas, F 6). Rockport has considerable trade in fish, oysters, game, and wool. Excellent bathing facilities give the town some reputation as a summer resort. Population, in 1890, 1069; in 1900, 1153.

ROCK PTARMIGAN. See PTARMIGAN.

ROCK RABBIT. See HYRAX.

ROCK SALT. See SALT.

ROCK SNIPE. An American gunner's name for the purple sandpiper (q.v.).

ROCK SOAP, or SAPONITE. A soft, clay-like, hydrated aluminium-magnesium silicate that is found massive, and is of a white or light gray color. It is greasy to the touch, adheres to the tongue, and is easily cut with a knife. It is used for crayons by painters.

ROCK SPRINGS. A city in Sweetwater County, Wyo., 258 miles west of Laramie, on the Union Pacific Railroad (Map: Wyoming, E 5). Coal is extensively mined in the vicinity. Population, in 1890, 3406; in 1900, 4363.

ROCK-STRO (properly, Rack-straw), WILLIAM SMYTH (1823-95). An English musical writer, born at North Cheam, Surrey. He studied at the Leipzig Conservatory under Mendelssohn, Plaidy, and Hauptmann. In London he taught piano and singing. After 1891 he lived in London, where he gave lectures at the Royal Academy of Music. He wrote a standard *Life of Handel*, and a biography of *Jenny Lind, the Artist*, in collaboration with Canon Scott-Holland, and composed a sacred cantata, *The Good Shepherd* (1886), a ballet, *Flora's Path* (1891), overtures, and songs. He was an authority on ecclesiastical music.

ROCK-SWALLOW. See CRAG-MARTIN.

ROCK TROUT. A family of carnivorous sea-fishes (Hexagrammidae) of the North Pacific. They are mostly of large size, live in kelp about rocks, and furnish good food, although their flesh and bones have a greenish tinge, whence they are sometimes called 'greenlings.' One species of great importance in the Aleutian Islands among several related Alaskan 'greenfish' is the so-called 'Atka mackerel,' which is about 18 inches long, is handsomely colored, exceedingly numerous, and of excellent food qualities. The best known of these fishes, however, is the bodieron (q.v.).

ROCKVILLE. A city in Tolland County, Conn., 15 miles northeast of Hartford, on the Hockanum River and on the New York, New

Haven and Hartford Railroad (Map: Connecticut, F 2). The Hockanum River makes a total descent of more than 250 feet through Rockville, affording excellent water-power. The industrial establishments include cotton and woolen mills, silk mills, knitting mills, envelope factories, etc. There are high school and public libraries. Settlers came to the vicinity of Rockville as early as 1721, but the village proper dates from about 1840. It was chartered as a city in 1889. Population, in 1890, 7772; in 1900, 7287.

ROCKWEED. See PHLEOPHYCÉE; SEAWEED.

ROCK WREN. A singular little wren (*Salpinctes obsoletus*) of the Southwestern United States, which lives among the loose rocks of the mountain sides, where it places its large globular nest upon a ledge or within some crevice. It creeps and skips about with the furtive activity of a wild mouse, and in spring utters a loud, sweet, and beautiful song, somewhat like that of the mocking wren. Consult Coes, *Birds of the Colorado Valley* (Washington, 1878).

ROCKY MOUNTAIN LOCUST. See LOCUST.

ROCKY MOUNTAINS. A name here used to indicate the assemblage of mountain ranges which form the 'backbone' of North America. They begin at the south in Central Mexico, and extend northward across the United States and Canada to near the coast of the Arctic Ocean. On the east they are bordered from near Vera Cruz, Mexico, to the valley of the Mackenzie, by the Great Plateaus, or Great Plains as more commonly termed; and on the west, within the United States, by the Great Basin region which reaches from the head of the Gulf of California northward into Canada, and separates them from the Sierra Nevada and Cascade Mountains. The west border in Canada is less well known and as seems probable less sharply defined than is the portion just referred to, but may be taken at least provisionally as coinciding with the west border of the Gold Mountains of Canada.

The unsatisfactory condition of the nomenclature at present applied to the larger physiographic features of North America is illustrated above by the rather vague limits it is necessary to assign to the Rocky Mountains. The same condition is also shown by the fact that in Canada the term Rocky Mountains is restricted to the east range of the series of uplifts to which it is applied in the United States. To the west of the range thus designated, in Canada, and separated from it by a broad valley some 700 miles long, trending north and south, are the Gold Mountains, consisting principally of the Selkirk, Purcell, Columbia, and Caribou ranges. The term 'Canadian Rockies' is in current use, however, and includes all of the mountains in Canada, which are a direct northward continuation of the Rocky Mountains of the United States.

To the south of the United States the Rocky Mountains include the tableland of North-central Mexico, with its numerous rugged mountain ranges and intervening valley, all of which trend in a generally north and south direction.

The length of the Rocky Mountain chain from north to south is some 4000 miles, and its width between 400 and 500 miles. Within its borders are several mountain systems, as will be shown below, and a large number of individual ranges,

together with several large plateaus, numerous valleys, 'parks,' canons, etc., as well as multitudes of peaks, ridges, mesas, and buttes. In fact, it contains typical representatives of nearly every known topographic form. Considered in reference to origin, the topographic forms mentioned include elevations produced by the upheaval, folding, and faulting of sedimentary and other rocks, and also mountains due to volcanic eruptions, and still others produced by igneous intrusions, and an endless array of secondary features resulting from erosion or earth sculpture. One of the most conspicuous features of the chain, and one which has been used as a basis for dividing it into two portions, is the presence in Wyoming of a broad plateau trending east and west, known as the Laramie Plains. This plateau, with a general elevation of about 7000 feet, reaches from the Grand Plateau in the east nearly to the Great Basin in the west and separates the northern from the southern Rockies. This great 'pass' was chosen for the route of the Union Pacific Railroad, the first of the several transcontinental railroads now in operation. The several ranges composing the southern Rockies are for the most part arranged with their larger axes in a generally north and south direction, while the trend of the northern Rockies, as well as of their component ranges, is in general northwest and southeast.

Within the United States the portion of the Rocky Mountains to the north of the Laramie Plains has been termed the Stony Mountains, a revival of the name applied to them by Lewis and Clark, during their historic explorations in 1804-06; and the portion of the southern Rockies, situated principally in Colorado, northern New Mexico, eastern Utah, etc., has been designated as the Park Mountains. These two systems of ranges are the best known portions of the chain of which they form a part, and together with the southern portion of the Canadian Rockies must of necessity be taken as representative of its entire extent.

The Stony Mountains contain among their leading topographic features many important mountain ranges. In Wyoming the representative uplifts are: The Big Horn range, which, extending from near the centre of the State about 150 miles northward, ends in Montana. It is due principally to a single great upward fold in the rocks; the east slope is precipitous and the west slope gently inclined. The crest line has an elevation of from 8000 to 13,000 feet, and Cloud Peak, the culminating point, rises 13,165 feet above the sea. The Wind River range, in the west-central part of the State, presents a fine series of rugged peaks along its crest, at least a dozen of which have elevations in excess of 11,000 feet, the highest being Fremont Peak, 13,790 feet. The Teton range, near the northwest border of the State, is the boldest and probably the finest of the series, and culminates in the Grand Teton, a spine-like peak, rising 13,691 feet above the sea and 7000 feet above Jackson Lake, from which it may be seen to the greatest advantage. The Wind River, Teton, and other neighboring ranges, situated principally in northwest Wyoming, rise from a region some 15,000 square miles in area, which has a general elevation in excess of 8000 feet and is only exceeded in extent among the regions of similar elevation in North America by the central part of the Park Mountains. From

this mountainous plateau of Wyoming, and supplied principally by the melting of the snow on the lofty ranges, the Yellowstone River flows eastward to join the Missouri, and the Snake River flows westward and unites with the Columbia; the many head-branches of these two important waterways adjoin along the continental divide. In central Idaho there is a great region of sharp, serrate peaks, the character of which is expressed by the name of the main or Sawtooth range, by estimate about 13,000 feet high. Topographically this rugged region extends northwest and is known in part as the Bitter Root and the Cœur d'Alène Mountains, which, although not remarkable for their height, are of great extent and important on account of their mines, forests, and fine scenery. In Montana there are also several distinct and important ranges, among which there are not less than 23 peaks that exceed 10,000 feet in height above the sea and rise from 6000 to 8000 feet above the neighboring valleys.

To the east of the Big Horn Mountains and separated from them by a portion of the Great Plateaus, 150 miles wide, are the Black Hills, which in a general view are included in the Rocky Mountains. These hills are due to a dome-like elevation of the generally horizontal rocks underlying the Great Plateaus, measuring about 80 by 160 miles, which if uneroded would have a height of some 7000 feet above the surrounding plain. Erosion has cut deeply into the uplift, however, and produced a rugged topography, especially in its central part, where granitic rocks are exposed. The culminating summit, Harney Peak, has an elevation of 7216 feet and rises about 2700 feet above the surrounding plain.

The Park Mountains, situated to the south of the Wyoming Plateau, are composed of many distinct ranges having a north and south trend, to which, however, a marked exception is furnished by the Uintah range in southwest Wyoming and northeast Utah, which consists of a deeply dissected east and west fold or broadly uplifted plateau. Intervening between several of the adjacent ranges, especially in Colorado, there are wide, nearly flat-bottomed valleys which owe their leading characteristics to the depth of the deposits of debris swept into them from the bordering uplands by streams and the wind. These valleys are known as 'parks' and suggested the name for the mountain system in which they occur. Typical examples are furnished by North, Middle, South, and San Luis parks in central Colorado, the broad generally level floors of which have elevations ranging from 7000 to 8000 feet.

Among the numerous ranges of the Park Mountains in Colorado are the Front or Colorado range, in view from Denver, the Saguache, Elk, San Juan ranges, etc. A conspicuous feature in the relief is the generally great elevation and the large number of lofty summits. The area above an elevation of 10,000 feet is much larger than any other region with a similar altitude in North America. Among the host of magnificent mountain peaks there are more than 30 which exceed 14,000 feet, but their height is seldom fully appreciated, owing to the elevation of the neighboring valleys, which reduces their *visual height* to about one-half of their total elevation above the sea. Of this multitude of magnificent individual mountains or peaks, as many of them are termed, the best known and perhaps most representative

are, with their elevations expressed in feet: Gray's Peak, 14,341; Mount Harvard, 14,325; Mountain of the Holy Cross, 14,006; Mount Lincoln, 14,297; Long's Peak, 14,271; Mount Princeton, 14,196; Pike's Peak, 14,108; Uncompahgre Peak, 14,289; and Mount Yale, 14,187. In the opinion of many observers the most magnificent mountain mass in the Park Mountains, largely on account of its isolation, is Sierra Blanca, in southeast Colorado, 14,465 feet.

The Park Mountains extend west into Utah and there include the bold Wasatch range, with a culminating summit nearly 12,000 feet above the sea. This range is in view from Ogden and Salt Lake City and presents a wonderfully bold escarpment to the west, which sharply defines the west border of the Rocky Mountains for a distance of some 200 miles.

To the southwest of the as yet indefinitely determined border of the Park Mountains is a series of high plateaus termed collectively the Colorado Plateaus, situated principally in Arizona, western New Mexico, and southern Utah, which have elevations ranging from 7000 to 8000 feet, and have been deeply dissected by the Colorado River and its tributaries. The explorations of J. S. Newberry, J. W. Powell, and C. E. Dutton in this land of remarkable cañons have made it one of the best known and to geologists and geographers most instructive portions of the Rocky Mountain region.

In New Mexico the mountains are lower than in Colorado, and the several ranges and numerous isolated volcanic mountains are separated by broad deeply filled valleys. These same characteristics of the relief extend southward into Mexico, where the Rocky Mountains terminate and are succeeded by a series of lofty volcanoes, and by the western portion of the Antillean cordillera, in which the major structural features are folds and faults, trending east and west.

Geologically the Rocky Mountains present a wide range in reference especially to the age of the rocks and to the structure of the numerous ranges. All of the larger divisions of geological history from the Archaean to recent times are represented. Granite, gneiss, schist, and related rocks usually referred to the Archaean occur especially in the axial portion of many of the ranges, as the Front or Colorado range, the Saguache, etc., in Colorado, the Black Hills, Big Horn, Teton, etc. The older recognized sedimentary rocks belong to the Algonkian period and consist largely of quartzites. In the Lewis and Livingston of Montana rocks of this age have yielded interesting remains of large crustaceans related to *Eurypterus*, which belong to the oldest known fauna of the earth. In sandstone of Ordovician (Lower Silurian) age near Cañon City, Colo., the oldest known fossil fishes have been found. Carboniferous rocks, principally marine limestone, occur widely throughout both the Stony and Park Mountains. At several localities in Colorado and Wyoming rocks of Jura-Trias age have yielded large quantities of bones belonging to gigantic extinct reptiles. Marine sediments of Cretaceous age, particularly in Montana, are frequently crowded with beautifully preserved shells, and particularly a great variety of cephalopods. Tertiary rocks, consisting principally of the sediments of lakes and occurring for the most part in the valley, contain the bones of many genera of extinct mammals, some of

them of large size and remarkable character. In beds of similar age, consisting largely of volcanic dust, at Florissant, Colo., immense numbers of fossil insects have been obtained, and near Green River in Wyoming soft shales are crowded with the remains of fishes. Fossil plants, particularly of Lower Cretaceous, Jurassic, and Tertiary times, are also abundant. Valuable coal seams of Cretaceous and Tertiary age occur at many localities.

One of the most remarkable facts concerning the geological structure of the Rocky Mountains is the presence of a series of abrupt folds along their eastern border in which the horizontal strata, several thousand feet thick, underlying the Great Plateaus, are bent upward. Remnants of these same beds spared by erosion occur in several of the ranges to the west of the Front range, at an elevation of 5000 or 6000 feet above the portions not affected by mountain-building forces. At many localities along the east base of the Front range, from New Mexico northward far into Canada, the abrupt folding of the rocks is shown by the nearly vertical position of the eroded border of the strata remaining. At times the folds were overturned eastward, so that the beds in their eroded basal portions dip westward. In northern Montana a still more intense movement resulted in the fracturing of the rocks in an overturned fold, producing a nearly horizontal fault or thrust plain, in connection with which, as reported by Bailey Willis, Algonkian rocks were carried seven miles eastward and rest on Cretaceous strata.

In general the various ranges composing the Rocky Mountain chain are due to upward folds or anticlinals in sedimentary and igneous rocks, and the elevation of plastic magmas now represented by granite, gneiss, schist, etc., in their central portions. In general, also, as shown by the north and south trend of the longer axes of the folds, the direction in which the force acted which caused the rocks to bend was east and west. The principal movements which upraised the mountains occurred at the close of the Mesozoic, as is shown by unconformities between Mesozoic and Tertiary beds.

The upheaval of the mountains was followed by erosion. Nearly all of the scenic features which now attract the eye are due to the work of streams and glaciers which have deeply sculptured the upheaved mountain blocks. The broad valleys, including the parks of Colorado, etc., are due to the upraising of their bordering mountains; but the cañons, such as the Yellowstone, Arkansas, Colorado, and other streams flow through, are the result of abrasion by the debris-charged rivers themselves. The infinitely varied secondary valleys and cañons and the multitude of gorges, gulches, amphitheatres, and other similar incised features of the relief are due to erosion, while the countless mesas, buttes, pinnacles, etc., which rise above the general level of the surrounding country are remnants of ancient uplands spared by the erosive agencies. Erosion or earth sculpture has also brought out the characteristic features of the Black Hills in which the more resistant rocks stand in relief and the weaker beds underlie valleys, and has given to the several regions of 'bad lands' their unique topography. In addition to the numerous ranges due to lateral pressure and consequent upward folding there are many elevations due to volcanic

agencies. Mountains built by volcanic eruptions are numerous in Arizona and New Mexico. Both classes belong San Francisco Mountain and Mount Taylor, situated farther east, in sight of which there are a large number of 'volcanic necks' exposed by the removal of the craters which once enclosed them. East of the Front range in New Mexico, and well out in the Great Plateaus, there are a number of conspicuous volcanic craters, of which the leading example is Mount Capulin, 2750 feet high above the surrounding plain, and with a crater on its summit nearly a mile in diameter. The Spanish Peaks, in southeastern Colorado, furnish admirable examples of the deep erosion of large volcanic craters. Colorado, Wyoming, and Montana are almost wholly without recent volcanic craters, but in Western Wyoming and extending across southeastern Idaho are the basaltic lavas of the Snake River Plains, one of the most wonderful exhibits of its kind in the world, associated with which there are numerous volcanic craters. In the region of Yellowstone Park there are great accumulations of rhyolite lava, of older date than the basalts of Idaho, but still retaining some of their volcanic heat, as is made manifest by the numerous hot springs and geysers. Associated with volcanic eruptions is the injection from below of molten or plastic magmas into the rigid rocks composing the outer portion or 'crust' of the earth. These intrusions in part occupy fissures and form dikes, but at times were forced between stratified beds and produced intruded sheets of igneous rocks, perhaps many scores of square miles in area, and under other conditions formed cistern-like intrusions termed laccoliths, which raised the rocks above into domes. In the Rocky Mountains there are numerous examples of each of these varieties of igneous intrusions, many of which have been laid bare by erosion. Of these the most remarkable are the laccoliths forming the Henry Mountains in southern Utah, where several intrusions in previously horizontal rocks elevated domes measuring three to five miles in diameter and from a few hundred to fully 7000 feet high. These mountains furnished the type of a class of uplifts not previously recognized. Other similar laccolithic mountains occur in southwest Colorado, and about the Black Hills in South Dakota, and have been recognized elsewhere.

Perennial snow banks and miniature glaciers occur in the mountains of Colorado and on the Teton range in Wyoming. In northern Montana small glaciers are frequent, and in the Canadian Rockies form a conspicuous feature in the magnificent scenery. The best known is perhaps M'Callister glacier, near Glacier House, on the line of the Canadian Pacific Railroad. Other glaciers occur in the higher portions of the mountains throughout Alberta. The glaciers are all of the Alpine type, and from Montana northward are remnants of great ice sheets which covered the mountains during the glacial epoch. Many of the more conspicuous features in the North Rockies, such as the deep steep-sided valleys, with rounded or U-shaped bottoms, numerous lakes and side elevations from which the streams descend in cascades, are due to the former glaciers which flowed away from the several ranges. The summit portions of the Big Horn, Teton, and other ranges in Wyoming are glaciated, as is also a large area in the region of great mountains in Colorado. Nearly all of the numerous and fre-

quently exceedingly beautiful lakes of the Rocky Mountain region are due to the work of glacial ice. Those near the crests of the higher ranges are, for the most part, rock-basins, while those at lower altitudes, and especially the long, narrow lakes in the larger valleys, are held by morainal dams.

The chief industry throughout the Rocky Mountains from Alaska to Mexico is mining, and silver, gold, copper, and coal are the leading products. Next in importance is stock-raising, and particularly cattle-raising, for which the nutritious bunch grass, growing mostly below the lower limit of the forests, furnishes abundant nourishment. In recent years, however, overgrazing has greatly injured the natural pasture lands south of Montana. Agriculture is of local importance, and with certain exceptions, mostly in western Idaho and adjacent portions of Washington, is dependent on irrigation. All through the region from the central part of British Columbia to Central Mexico there are ranches, mining camps, villages, and cities. At present seven railroads, six in the United States and one in Canada, cross the chain, and another to the north of the Canadian Pacific Railroad is projected. In Mexico the main avenues of traffic run north and south through the intermontane valleys, as is shown by the Mexican Central Railway, which connects Ciudad Juarez, opposite El Paso, Texas, with the City of Mexico, a distance of over 1000 miles. These several railroads and their numerous branches make accessible nearly all portions of the Rocky Mountain region, except the extreme north and the excessively rugged western portion of the tableland of Mexico. At the far north, however, a new centre of industry has developed in the Klondike region. The forests of the mountains are economically important, not only as a source of lumber, but also because they serve to regulate the flow of streams used for irrigation. For these reasons 21 forest reserves, with a total area of over 38,000 square miles, have been established in the portion of the Rocky Mountains belonging to the United States, and similar provisions have been made in Canada.

Among the economic assets of the Rocky Mountains should also be included their magnificent scenery and healthful and invigorating climate. Although thousands of people visit them each year in search of health and recreation, the great benefits to be reaped in these directions are as yet only partially appreciated. The portions most attractive to travelers are the Yellowstone National Park and the Grand Cañon of the Colorado, each of which is unrivaled in its class.

FLORA. The Rocky Mountains constitute one of the great floral regions of North America. With the exception of southern New Mexico and Arizona, which belong botanically to the Mexican Plateau, and the extreme northern portion, whose flora is still but little known and merges with that of the Pacific Coast, the flora of the whole Rocky Mountain region is essentially homogeneous at corresponding altitudes. On the other hand, the region is markedly different from the Eastern or Appalachian region. Scarcely 20 per cent. of the Rocky Mountain plants are found in the East, and of these most belong to the species common to both hemispheres. The Rocky Mountain flora, however, includes numerous species found in the contiguous regions, and is especially

allied to that of the California or Sierra Nevada region. Within certain altitudes forests occur throughout the Rocky Mountain region. The upper limit of tree growth, or cold timber line, rises toward the south, having an elevation of 9000 feet on the international boundary and 11,000 to 12,000 feet in Colorado. In the Stony and Park Mountains and thence southward there is also a lower limit of tree growth, determined mainly by lack of humidity. As far north as Idaho and southern Wyoming the larger valleys are below this dry timber line, but in Canada the forests are continuous across mountain and valley. The forests of the whole region are overwhelmingly coniferous, and with the exception of two alpine junipers none of the coniferous trees are common to the Appalachian region, though the latter has closely allied corresponding species, some of which have been erroneously identified with those of the Rockies. There are about 10 pines, and the most characteristic tree of the whole region is the Western yellow pine (*Pinus ponderosa*). The nut pine (*Pinus edulis*) and the *Pinus Chihuahuana* are the chief species confined to the southern portion, while the mountain pine (*Pinus monticola*) and the black pine (*Pinus Murrayana*) are found chiefly in the north. Of the spruces the *Picea Engelmanni* is the most common throughout the region, though generally seeking higher altitudes (nearly 9000 feet in the south). Other spruces, notably the *Picea Columbiana*, are more common in the north, and a northern habitat is also preferred by the firs (*Abies grandis* and *nobilis*), the Western Hemlock (*Tsuga Mertensiana*), and the tamarack (*Larix Americana*). Shrubby conifers, such as junipers, are found chiefly in the arid southwestern ranges and above the timber line. The deciduous forests of the Rocky Mountains are of small extent and poor in species. There are six species of oak, but all rather small and scrubby, and the other deciduous tree families are similarly ill represented. Sycamores, the New Mexican locust, and mulberries grow in the south, and the rivers throughout the region are lined with cottonwood, balsam poplar, and willows. On the level plateaus the predominating flora is of the sage-brush type, represented by the genera *Artemisia*, *Atriplex*, *Eurotina*, and *Pigelexia*, but in the southwest the plains are nearly desert, with the characteristic desert flora. Above the timber line the Alpine flora closely resembles the flora of the Arctic region. Among all the flowering plants of the Rocky Mountains the families best represented are in the order named, the Compositae, Gramineae, Papilionaceae, Cyperaceae, Ranunculaceae, Cichoriaceae, Polygonaceae, Onagraceae, and Umbelliferae. Of these the first two together include about 25 per cent. of all the species.

FAUNA. It was the opinion of the earlier students of animal life in North America that the Rocky Mountains were the central and essential part of a peculiar fauna representing the 'Central' zoögeographical region embracing the whole elevated territory between the Great Plains and the base of the Sierra Nevada. It appears, however, that such a distinction does not exist; that the Rocky Mountains are peculiar only in such features as depend upon altitude and are correlated with climate and vegetation as locally determined by height above the sea and consequent low temperature. The fauna of all North

America is remarkably diffuse and uniform, so that it is considered indivisible by any well-marked distinctions; nevertheless certain zones of life roughly bounded by summer isothermal lines have been recognized as Boreal, Hudsonian, Canadian, Alleghanian, Carolinian, etc., in succession from north to south. These are reproduced in the Rocky and other high ranges of the West. The height above the general base-level at which such life-zones will be found depends upon the latitude. Thus at the northern extremity of the range, near the mouth of the Mackenzie, not only the summits but the base of the range are within the 'Boreal zone'; but at the southern extremity in New Mexico, the base exhibits a Carolinian or even warmer type of fauna, and one must climb 13,000 or 14,000 feet to find upon the peaks Arctic weather, and Arctic plants and animals. It is in these restricted summit areas that one finds the animals peculiar to the region; in the valleys and parks there is little that is distinctive. It is only when one has risen considerably that local specialties begin to appear. Thus in a medium latitude (say Montana) at about 9000 feet, one rises above the sagebrush, the Douglas fir, and the black pine, with their host of valley and plain animals, and into forests of Alpine fir, white-bark and Engelmann's pines, which indicate a climate equivalent to that about Hudson Bay. Here are breeding snow-birds (Junco), the nut-cracker, Canada jay, kinglet, and other northerly birds. This zone extends to the timber line and forms the normal upward limit of the wapiti, moose, and mule deer; the grizzly and black bears; the wolverine, many mice, squirrels, and the smaller carnivores that prey upon them. At and near the timber line one begins to find among the stunted trees and plants animals which do not come lower down, but spend their lives altogether there and upon the treeless summits above it, and these are the really characteristic mountain animals; and yet with very few exceptions (the sewellel is most conspicuous) they are the same as those of sub-arctic America generally or of the high ranges of the Pacific Coast, or different only in specific details. Such among the larger animals are the bighorn, and the Rocky Mountain white goat (q.v.). The former is practically a circumpolar form, and the latter is numerous at sea-level in the far north, but is scarce in the United States. The bighorn is still to be found as far south as San Francisco Peak in Arizona. Along with these two game animals are several small ones peculiar to the heights. One of the most characteristic is the pika (*Lagomys princeps*); another is the lemming mouse (*Phenacomys orophilus*), an Arctic form that burrows in the moss of the Alpine meadows; and a third the whistler, a marmot (*Arctomys*), inhabiting these heights only toward the north. This, with a weasel, which descends in winter, when the small animals are hibernating or living upon their stores in underground burrows, and when the sheep have migrated below the snow line in order to find browse and pasturage, constitutes the list of peculiarly Rocky Mountain mammals. On the heights, however, breed certain birds, as species of ptarmigan, the rosy finches (*Leucosticte*), and an occasional golden eagle or great owl.

The general list of animals of the lower levels of the Rocky Mountain region is a very long one,

and includes many which are distinguished as local or geographic races or subspecies of more widely distributed forms. The bison, pronghorn, and the white-tailed deer range throughout the valleys and climb the heights to a considerable altitude in summer, and in the north caribou are common; but the bison is extinct, the wapiti remains only from north-western Wyoming northward, and the pronghorn is scarce. Among the carnivores, grizzly and black bears, the puma, wildcat, wolverine, otter, marten, fisher, long-tailed weasel, black-footed ferret, badger, striped and spotted skunks, red fox, kit fox, raccoon, and coon make a long list attractive in early days to trappers. An extensive catalogue of rodents includes a large number of local species of mice, woodrats and voles, the beaver (now greatly reduced), muskrat, and several hares, one or two of which are peculiar; and many species or races of burrowing 'gophers,' and of arboreal and terrestrial squirrels. The same principles apply to the birds, of which about 100 species and varieties have been recorded as occurring in the central Rocky Mountain region, of which about 250 are known to breed there. A goodly list of reptiles and batrachians and fishes may be compiled, the last group distinguished by the predominance of salmonoids. Several species of the Pacific coast salmon regularly reach the Rocky Mountains by ascending the Columbia, Fraser, and more northerly rivers. Insects abound and this region is the headquarters of the locust-tribe in America.

In general it may be said that what is most peculiar in the fauna of the Rocky Mountain region has been derived from the north, and leads back to the Glacial period, when the pre-glacial boreal fauna was pressed southward by the slow cooling and final refrigeration of Canada. When the ice slowly melted under the restoration of warmer conditions a large representation of this Arctic fauna found upon the summits a local continuance of the cool climate favorable to it, and has remained there, often in the south isolated upon peaks which it cannot leave, and where it has survived in limited colonies cut off from the north. This history (which was also that of the Coast ranges) and the barriers afforded by the breadth of high, dry plains to the eastward, account for the greater likeness of the Rocky Mountain fauna on the whole to the Pacific than to the Atlantic side of the continent.

ROCKY MOUNTAIN SHEEP. See BIGHORN.

ROCKY MOUNTAIN SUBREGION. A zoogeographical subdivision of the Nearctic region, embracing the mountainous country between the North American plains and the sum-

mits of the Sierra Nevada and northern Coast ranges.

ROCKY MOUNTAIN TROUT. See DOLLY VALDEN TROUT.

ROCKY MOUNTAIN WHITE GOAT. A goat-antelope (*Oreamnus montanus*) of the higher mountains of Western North America. The outer hair is long, especially about the fore quarters, and has beneath it a woolly underfur. It stands about three feet high at the shoulders, which are somewhat arched or humped, while the head is carried low. The nose is hairy, there is a beard, and the horns, present in both sexes, are slender, smooth, backward-curving, eight to ten inches long, and black, which is also the color of the small hoofs. The nearest relatives of this animal are the chamois and serow, but its appearance is very different from that of either. Its home is the summits of the mountains from the 'high sierras' of California and the central Rocky Mountains to Alaska, but it has become rare south of British Columbia. Its long silky coat, which the Indians were wont to weave into curious blankets, and its pure white and highly protective color, indicate a snowy habitat, and this animal is an inhabitant of the glacial peaks and the great snow-fields alone, rarely coming down even as low as the timber-line, but finding its foliage among the alpine pastures that border the glaciers. It climbs with astonishing agility, picks its way along cliffs and ledges where the gales blow the snow away as fast as it falls, or feeds upon the highest grassy slopes, so steep that they are last to hold the snowfall of winter and earliest to be swept clean by the spring avalanches. It moves in beaten trails, often the only means the hunter has of following it, and in some narrow places the treading of countless hoofs for countless generations has actually worn deep paths in the solid granite. Their flesh is good eating, and their hides command a large price when well made into robes or rugs. Two kids are usually produced in the spring and remain with the parents until the next spring, forming a family party which moves about in company, but no large flocks are ever found. Consult: Stone and Cram, *American Animals* (New York, 1902); Baillie-Grohman, *Fifteen Years' Sport . . . in the Hunting Grounds of Western America* (London, 1900). See Plate of GOAT-ANTELOPES.

ROCO'CO (Fr., apparently coined from *rocaille*, rockwork, from *roche*, ML. *roca*, rock). The name given to a late and fantastic branch of the Renaissance which prevailed in France, Germany, and other parts of Central Europe during the latter half of the seventeenth and the first half of the succeeding century. It was really a sub-species of the Barocco style of architecture and decoration, which took but slight hold in Italy. It played extravagant tricks with design, showing no restraint in its caprice; fond of rustic work and outdoor effects, it revelled in rockwork, fountains, gardens, pavilions, and villas. It broke all the rules of proportion, design, and composition drawn up by the purists of the Renaissance, and aimed at broken and curved lines and surfaces, irrational details, and incongruous masses.

ROCROI, rô'krwâ'. The capital of an arrondissement in the Department of Ardennes, France, 15 miles northwest of Mézières, situated on an

extensive plateau 1300 feet above the sea, surrounded by the Forest of Ardennes (Map: France, 1, 2). Population, in 1901, 2176. It is memorable for the victory gained by the Duke of Enghien (the Great Condé) over the Spaniards, May 19, 1643, in which battle a century's reputation for invincibility enjoyed by the Spanish infantry was destroyed.

ROD (AS. *rôd*, OHG. *ruota*, Ger. *Rute*; possibly connected with Lat. *radius*, staff, *radius*, rod, staff, spoke, semidiometer. Skt. *radh*, to grow). A measure of length equivalent to 5½ yards, also called a pole. In surveying (q.v.), an instrument used in taking levels. See ENGINEERING INSTRUMENTS.

ROD, rôd, EDUARD (1857—). A French author, born at Nyon, Switzerland. He studied philology at Bonn and Berlin, went to Paris and became (1884) editor of *La Revue Contemporaine*. In 1887 he was chosen professor of comparative literature at Geneva, but he soon resigned, returning to Paris and literature. In 1899 he visited the United States on a lecture tour. His first novels are naturalistic, *Côte-à-côte* (1882), *La femme de Henri Vaucaux* (1884). With *La sacrifiée* (1892) Rod passed under the influence of Tolstoy, though affected somewhat by Renan and Bourget. This appears most clearly in *Michel Tessier* (1893-94), but also in *Les rochers blancs* (1895), *Père et fils* (1897), *Pastor Naudic's Young Wife* (trans. 1899), and *An milieu du chemin* (1900). His critical work is represented by such books as *Dante et Stendhal* (1889), *Les Allemands à Paris* (1880), and *Etudes et nouvelles études sur le XIXème siècle* (1888 et seq.).

RODAS, rô'dás. A town of the Province of Santa Clara, Cuba, 55 miles west of the city of that name. Its chief productions are sugar and fruits. Population, in 1899, 3390.

RODBERTUS, rôd-bêr'tus, JOHANN KARL (1805-75). A German economist, founder of the scientific or conservative school of socialism. He was born August 12, 1805, in Greifswald, where his father was a professor of Roman law. He studied law at Göttingen and Berlin, and served from 1827 to 1832 in the Prussian judiciary. By 1837 he had formulated his social platform, and in that year published *Die Forderungen der arbeitenden Klassen*. Elected to the National Assembly in 1848, he was Minister of Education in the Auerwald-Hanseemann Ministry for a fortnight, and in 1849 was a leader of the Left Centre. The last twenty years of his life were spent in retirement. Socialism, as defined by Rodbertus, was to be a gradual evolution, hence his acquiescence in a monarchy, and his break with the Democrats as a political party. He regarded the social question as a purely economic one. His principal doctrines are these: The workman's share of the nation's industrial income tends constantly to decline; land rent and interest are the result of the exploitation of the working classes; the present shares in the distribution of wealth—rent, profits, interest, and wages—are not entirely the result of permanent, universal economic forces, but the result of historical evolution and the prevailing legal system; financial and commercial crises are due to a non-adjustment of production and consumption; the laborer's purchasing power is

small and the capitalist and landlord classes, instead of increasing their consumption of luxuries, invest their savings in new factories, and in otherwise increasing the means of production, with the inevitable result that commodities of common consumption are produced in excess - the great cause of crises. Rodbertus died in 1875. His works include: *Zur Erkenntnis unserer staatswirtschaftlichen Zustände* (1842); *Soziale Briefe*, addressed to Julius von Kirchmann (1850-51); *Der Normalarbeitstag* (1871); and *Beleuchtung der sozialen Frage* (1875). His statement of his theory of crises, contained in his *Soziale Briefe*, has appeared in an English translation under the title of *Overproduction and Crises* (New York, 1898). Consult the sketch in Stegmann and Hugo, *Handbuch des Sozialismus* (1897); Jantsch, *Rodbertus* (Stuttgart, 1899).

RODD, SIR JAMES RENNEL (1858-). An English diplomatist and verse writer. He was educated at Balliol College, Oxford, where he won the Newdigate prize with a poem on Sir Walter Raleigh (1880). Entering the diplomatic service (1883), he held various appointments at Berlin, Athens, Rome, and Paris. In 1893 he was placed in charge of the British agency at Zanzibar and was present at the skirmishes at Pumwani and Jongeni. In 1894 he was transferred to Cairo, as principal secretary to the British agency in Egypt. In 1897 he was sent on the important mission to King Menelik of Abyssinia. For his distinguished services he received a C.B. on his return and was knighted in 1899. His volumes of verse comprise *Songs of the South* (1881), *Poems in Many Lands* (1883), *Feda and Other Poems* (1886), *The Unknown Madonna* (1888), *The Violet Crown and Songs of England* (1891), and *Ballads of the Fleet* (1897). These books form a body of fluent verse often very beautiful. We may cite "The Daisy," "Good Bye," and the various domestic pieces in the *Songs of England*. In prose, Rodd has published *Frederick, Crown Prince and Emperor*, a biography (1888), and *Customs and Lore of Modern Greece* (1892).

RODE, rôd, JACQUES PIERRE JOSEPH (1774-1830). A French violinist, born at Bordeaux. He studied under Fauvel in his native place, and, later, under Viotti at Paris. At the opening of the Conservatoire, in 1794, he was appointed professor of the violin. In 1800 he was appointed solo violinist to Napoleon. In 1803 he went with Boieldieu to Russia, where he remained for five years as solo violinist to Alexander I. Afterwards, at Vienna, Beethoven wrote for him the *Romance*, Op. 50. He went back to Paris in 1828, but was unfavorably received and made his final withdrawal to Bordeaux. He wrote 13 violin-concertos; the important and much-used "24 caprices en forme d'études, dans les 24 tons de la gamme"; études; and 3 books of violin duos. His compositions are still highly regarded by violinists. He died at Bordeaux.

RODENBERG, rôden-bêrk, JULIUS (1831-). A German author, born of a Jewish family named Levy, at Rodenberg, in Hesse. He studied law at Heidelberg, Göttingen, Marburg, and Berlin, but devoted himself to literature and to travel, and edited, at Berlin, first the *Bazar* and then the *Salon*, until, in 1874, he founded the important *Deutsche Rundschau*, of which he re-

mained editor. He published in verse, *Sonnette für Schleswig-Holstein* (1831), *König Haralds Totenfeier* (1853; 3d ed. 1856), and *Leider und Gedichte* (1863; 5th ed. 1880); sketches of life and travel; several romances, *Die neue Sozialität* (1865), *Von Gottes Garden* (1870), *Die Gemüthlichen* (2d ed. 1881), *Der Schellhoopius Wanderver* (1890); and a biography of Franz Dingeldey (1891). Consult the memoirs, *Erinnerungen aus Jugendzeit* (1892).

RODENBOUGH, THOMAS FRANCIS (1838-). An American soldier and author, born in Eastern, Pa., and educated in private schools and at Lafayette College. He was appointed second lieutenant of the Second United States Dragoons in 1861; was on duty in the Cavalry School of Practice, and served in the campaigns of the Army of the Potomac. He lost his right arm at Winchester. He served after the war as inspector-general in Kansas and as major of the Forty-second Infantry. He was retired in 1870 as colonel of cavalry, because of wounds received in line of duty. In 1871 he became deputy governor of the Soldiers' Home, Washington, D. C.; was assistant inspector-general of New York State (1888-90), and from 1890 to 1901 chief of the Bureau of Elections, New York City. He wrote *From Everglade to Cañon with the Second Dragoons* (1875), *Aggravation and the Anglo-Russian Dispute* (1885), *Uncle Sam's Medal of Honor* (1886), *Autumn Leaves from Family Trees* (1892), and *Sabre and Bayonet* (1897). He contributed articles on military science to *The New International Encyclopedia*.

RODENTIA, rô-dên-hi-á (Neo-Lat., from Lat. *rodentia*, nom. pl., sc. *animalia*, animals, from pres. part. of *rodere*, to gnaw; connected with Skt. *roda*, tooth). The largest known order of mammals, the rodents, or gnawers, containing 20 or more families comprising several thousand species, distributed throughout the world, possibly excepting Australia and New Zealand. The largest, the capybara, is not as large as a hog, while some, as the mice, are very small. The order is distinctly characterized by its dentition, especially by the total absence of canines and the paramount importance of the front teeth or incisors. These are usually two in each jaw, separated by a considerable vacant interval from the molars. They are very large, reach far back into the skull, and continue to grow from persistent pulps as fast as their tips, or cutting edges, are worn away. They are coated on the front with hard enamel, and as the softer dentine of the remainder of the tooth wears away more rapidly, the cusp of each tooth takes a chisel-like edge, and its sharpness is maintained. In some groups the molar teeth are also perennial, and grow from persistent pulps. Another interesting fact is that in many groups, such as that of the rats and mice, there are no mill teeth. The molar teeth, of which there are usually three on each side, one in each jaw, have flat crowns with ridges of enamel, which make them highly effective as grinders. The stomach is simple; the intestines are very long; the caecum is often large, sometimes larger than the stomach itself. The brain is not large, and that of some rodents is nearly smooth, but in many families exhibits a considerable degree of convolution. The rodents are not generally distinguished for sagacity, although some of them,

as the beaver, exhibit remarkable instincts. They bear important relationships to mankind, chiefly as pests highly injurious to agriculture or obnoxious to the house-keeper; but some yield valuable furs, or are useful in other ways. The living rodents are grouped in two suborders, according to the arrangement of the incisor teeth. In the suborder *Duplicidentata*, which includes only hares, rabbits, and pikas, there are a pair of small accessory incisors in the upper jaw back of the functional pair. In the other suborder, *Simplicidentata*, there are only two incisors in each jaw. This suborder includes three sections: (1) *Hystriomorpha*, containing rodents with tibia and fibula distinct, a hairy muzzle, and 20 teeth; (2) *Myomorpha*, rodents with tibia and fibula united, a naked muzzle, and 16 teeth; (3) *Sciuromorpha*, rodents with tibia and fibula distinct, a naked muzzle, and 20 or 22 teeth. See HARE; PIKA; PORCUPINE; RAT; SQUIRREL.

Fossil Rodents. The rodent order probably arose some time during the earlier Eocene in North America, as typical rodents are found in the Middle Eocene, and by the end of the Eocene period all the great groups of the order were differentiated. The probability is that the rodents arose from the early Insectivora. It is noteworthy that as yet no intermediate forms have been found to connect the two great rodent groups, the *Simplicidentata* and the *Duplicidentata*, and a diphyletic origin is possible.

The rodents very early underwent a remarkably wide geographical distribution and by the end of the Eocene they were represented in North and South America, Europe, Asia, and Africa, and some existing groups seem to have been much more widely distributed than at present. The *Duplicidentata* are represented at the base of the Miocene in both Europe and North America by the existing families Lagomyidae and Leporidae, and no extinct families are known. Of the *Simplicidentata* the squirrels occur first in the Upper Eocene of Europe, and later in the White River beds of the Lower Miocene of North America. The earliest of the beavers (*Stenociber*) occurs in the White River formation and in the Miocene of Europe. The porcupine-like forms attained their greatest development in South America. The rats and mice first appear in the Upper Eocene of Europe in the genus *Cricetodon*, and in North America *Eumys* of the Lower Miocene is an early representative. Although nearly all the rodents have been quite small, there are notable exceptions in *Megomys* of the South American Pampean formation, a form "nearly as large as an ox," and in *Castoroides Ohoticus*, a North American rodent which must have equaled the black bear in size. This animal has been erroneously described as a giant beaver, but its relationship to the porcupines is now known to be closer. Consult: Flower, *Mammals Living and Extinct* (London, 1891); Beddard, *Mammalia* (ib., 1902); Waterhouse, *Mammalia*, vol. ii. (ib., 1818); Coles and Allen, *Monographs of North American Rodentia* (Washington, 1877).

ROD'ERIC (?c.711). King of the Visigoths in Spain from 708 or 709 to 711. He became King after the overthrow and death of Witiza, and according to one account the sons of Witiza joined with some malecontent Visigothic nobles—among whom was a Count Julian—and summoned to their aid the Arab chief who had just finished the conquest of Mauretania. Others as-

sert that the country groaned under the tyrannical government of Roderic, that his licentious behavior had disgusted many of his nobles, and that the people were ripe for a revolution when the Moslem invasion took place. Both are agreed as to the time and mode of the invasion; but the Arab historians brand Count Julian with treachery, as not only voluntarily surrendering Ceuta, the key to the country, but actually guiding the Berbers and Arabs under Tarik into Spain. A landing was effected at Algeciras in 711; and in spite of vigorous opposition from the Governor of Andalusia, Tarik marched on, routing Roderic's chosen cavalry, which had been sent to oppose him. Roderic hastened at the head of an army to oppose the invaders, who had been reinforced from Africa and by rebels. The two armies met near Jerez de la Frontera, and in July the decisive battle was fought. It is probable that the Christians would have been victorious but for the treachery of the King's Gothic enemies. The Saracens won a complete victory, which opened the way to the speedy conquest of Spain. Roderic's fate is unknown, and many legends have been current about his end. Consult Saavedra, *Estudio sobre la invasión de los Arabes* (Madrid, 1895).

RODERICK DHU, *dhū*. In Scott's *Lady of the Lake*, an outlaw chieftain, overcome and made prisoner by Fitz-James.

RODERICK RANDOM. A novel by Tobias Smollett (1748). The hero, a selfish bully, has adventures in many lands, during his hard life in the navy and on shore, some of which is autobiographical. Tom Bowling and Jack Rattlin are amusing naval characters, and the story, though coarse, is spirited and entertaining.

RODERIGO, *rod'ō-re'gō*. In Shakespeare's *Othello*, a Venetian, in love with Desdemona, and used by Iago to further his own purposes.

RODEZ, *rod'ēs' or rōw'*. The capital of the Department of Aveyron, France, situated on the crest and slope of a hill, on the north bank of the Aveyron, 148 miles northwest of Montpellier by rail (Map: France, J 7). Its streets are steep, narrow, winding, and dirty; but the promenades around the town are pleasant. The cathedral, with a lofty clock-tower, is a Gothic structure, dating from the thirteenth century. Other noteworthy buildings are the restored Romanesque Church of Saint Amans, the modern Church of the Sacred Heart, the bishop's palace, several mediæval houses, and the Renaissance Hotel d'Armagnac. There are ruins of a Roman amphitheatre and a restored Roman aqueduct supplies the city with water. A variety of woolen cloths are manufactured, cheese of a highly esteemed quality is made, and there is a large trade in cattle and mules. Rodez is the ancient Segodunum, the capital of a Gallic Arvernian tribe, the Rutheni, whence the mediæval Latin name, Rutena, and the modern name. It was the capital of the old County of Rouergue. Population, in 1901, 16,105.

RODGERS, *rodj'ez*. CHRISTOPHER RAYMOND PERRY (1819-92). An American naval officer. He was born in Brooklyn, and in 1833 entered the navy as a midshipman. He saw active service against the Seminole Indians in 1839-41, and in the Mexican War. From 1859 to 1861 he was commandant of midshipmen in the Naval Academy. At the beginning of the

Civil War he was placed in command of the frigate *Wabash* and rendered his first important service at Port Royal (November, 1861). In March, 1862, he commanded an expedition to Saint Augustine and Saint Mary's River, and at the capture of Fort Pulaski had charge of the naval forces operating in the trenches. In the attack on Charleston (1863) he was fleet captain. He afterwards commanded the steam sloop *Tequiquis* and the *Franklin*, and was on special service in Europe until 1872, when he was made chief of the Bureau of Docks and Yards. He was superintendent of the Naval Academy from 1874 to 1878, and held the same office for some time in 1881. During his naval service he rose to the grade of rear-admiral (1874). In 1881 he was retired.

RODGERS, JOHN (1771-1838). An American naval officer, born in Harford County, Md. He entered the naval service in 1798 as a lieutenant, and was executive officer of the frigate *Constellation* under Captain Truxton at the time the French frigate *L'Insurgente* was captured off Nevis, February 9, 1799. For his conduct in this action he was promoted to a captaincy. In May, 1803, he commanded the *John Adams* in the Mediterranean. In 1804 he commanded the *Congress* at Tripoli, in the squadron under Captain Barron, whom he succeeded in 1805. After peace was declared, he sailed to Tunis, where he dictated terms of peace to the Bey. His action while on the *President*, with the British man-of-war, *Little Belt* (May 17, 1811), as the result of an attempt on his part to effect the rescue of an impressed American seaman, widened the breach then existing between Great Britain and the United States. In 1812, war having been declared by the United States, Commander Rodgers was placed in command of a squadron consisting of the *President*, *United States*, *Congress*, *Hornet*, and *Argus*, and meeting the British ship *Belvidera*, chased her, and a running fight followed—the first battle of the war—in which Rodgers was wounded by the bursting of a gun in his vessel, the *President*. On a cruise soon afterwards, he captured a number of British merchantmen, and also the packet *Swallow*, which carried \$200,000 in specie. In 1814 he was ordered to the command of the new frigate *Guerriere*, and rendered valuable aid in the defense of Baltimore. From 1815 to 1824 he was president of the Board of Naval Commissioners, and in 1823 was acting Secretary of the Navy. From 1824 to 1827 he had command of the squadron in the Mediterranean. After his return he again served as Navy Commissioner until 1837.

RODGERS, JOHN (1812-82). An American naval officer, son of John Rodgers (1771-1838), born in Harford County, Md. He entered the navy as a midshipman in 1828, and saw active service in the Seminole War. During the years 1852-55 he commanded Government exploring expeditions in the North Pacific and Arctic oceans. At the outbreak of the Civil War he was ordered to the West, where for a time he superintended the building of ironclads. He then joined the Port Royal expedition and on May 15, 1862, commanded the *Galena* in the bombardment of Fort Darling. A few months later he was promoted to be captain and on June 17, 1863, while commanding the monitor *Wechauckon*, he fought and captured the Confederate ironclad *Atlanta*, thus

earning the rank of commodore. In 1870 Rodgers was given command of the Asiatic squadron, and, while on the coast of Korea, was fired upon by two forts, which he promptly bombarded and captured. From 1877 until his death he was superintendent of the United States Naval Observatory at Washington, and in 1863 he was chosen one of the fifty active members of the National Academy of Science.

RODIN, AUGUSTE (1819-?). A French sculptor, the chief master of the modern Naturalistic School. He was born near the Pantheon in Paris of a poor family. His only general education was at a school in Beauvais, kept by an uncle. When fourteen years old he entered the famous Petite Ecole in Paris, where many of the most eminent French artists have begun their special training. He failed to gain admission to the Ecole des Beaux Arts, and studied, without much advantage, at the school of Barre in the Jardin des Plantes, supporting himself by assisting plaster and paper-mache workers. At the age of twenty-two he modeled an extraordinary head, called the "Broken Nose," which is still one of the most powerful and characteristic of his works. In 1863 Rodin entered the service of Carrier-Bellense, art director of the Sevres manufactory, and remained with him until the beginning of the Franco-German War. During the Siege of Paris he served in the National Guard, and after the war he went to Brussels, where he was extensively employed in architectural decoration, his most important works there being two large groups for the Exchange.

Returning to Brussels after a short visit to Italy in 1875, where he was profoundly impressed by the works of Donatello and Michelangelo, he made an extraordinary statue, the "Age of Bronze," which he took with him to Paris in 1877, and exhibited in the Salon of that year. It was received most enthusiastically by the younger sculptors, but condemned by the more conservative on account of its radical qualities. Before the exhibition of 1878 Rodin modeled some superb decorative heads for the Trocadero Palace. This work and a bust of "Saint John," which Rodin exhibited in 1879, won for him the patronage and warm friendship of Turquet, Under-Secretary of Fine Arts, through whose instrumentality the "Age of Bronze" was bought for the State, and was cast in bronze and placed in the Luxembourg gardens. Some of the vases which Rodin had designed for Carrier-Bellense were placed in the Sevres Museum. In 1880 Rodin completed his statue of "Saint John Preaching," perhaps the most powerfully realistic work of modern times, which was bought for the Luxembourg gallery.

In the same year Turquet secured for him a commission for a bronze door for the Musee des Arts Decoratifs. This great work, which was exhibited in 1884 (in 1902 still unfinished), is eighteen feet high and twelve feet wide and is covered with figures suggested by Dante's *Inferno*, whence its name, "La porte de Enfer." Next in importance among his works is the monument to the six "Bourgeois de Calais," who, in 1347, offered themselves as a sacrifice to appease the wrath of Edward III of England, a work for which he received the commission in 1883. In its intense naturalism and dramatic energy, the

work is the culmination of the genius of Rodin, it not of modern sculpture. He also executed a number of admirable busts of great power, among which are those of Legros, Dalou, Victor Hugo, and Rochefort. In recent years he has produced some works of great interest, as "The Kiss" and the monument to Claude Lorraine. Others, however, as the statues of Victor Hugo and Balzac, have shown great eccentricity, if not actual deterioration. There was a comprehensive exhibition of all his works at the Paris Exhibition of 1900.

Consult: Bartlett, "Auguste Rodin, Sculptor," an excellent series of articles in *American Architect*, vol. xxv. (1889); also Maillard, *Auguste Rodin, statuaire* (Paris, 1899); "Rodin et son œuvre," in *La Plume* (ib., 1900); Brownell, *Modern French Art* (New York, 1901).

RODIYAS, rō-dē'yáz. A degraded and out-cast race in Ceylon, regarded by some as a branch of the Veddās (q.v.).

ROD'MAN, THOMAS JEFFERSON (1815-71). An American soldier, born at Salem, Ind. He graduated at West Point in 1841, and from that time until his death was continuously employed at various Government arsenals or on ordnance boards, rising to the rank of lieutenant-colonel of ordnance and brevet brigadier-general in the Regular Army. He invented the method of cooling gun-castings from the inside and the prismatic powder for use in large cannon. He published *Reports of Experiments on the Properties of Metal for Cannon and on Cannon Powder* (1861).

RODMAN GUN. See ARTILLERY; ORDNANCE.

ROD'NEY, CESAR (1728-84). An American patriot, born at Dover, Del. From 1775 to 1758 he was high sheriff of Kent County, and then became justice of the peace and judge of the lower courts. He was a delegate to the Stamp Act Congress in 1765, was Speaker of the Delaware Assembly from 1769 to 1774, and was chairman of the Delaware Committee of Safety and of the State Convention in 1774. In 1774-76 he was one of Delaware's representatives in the Continental Congress, where he was a strong advocate of independence, and was one of the signers of the Declaration. Having, in 1775, been made a colonel and later a brigadier-general of the State militia, he served under Washington in 1777, becoming a major-general of militia in September. From 1778 to 1782 he was President of Delaware.

RODNEY, GEORGE BRYDGES, first Baron Rodney (1719-92). An English admiral. Entering the English navy in 1732 as King's letter-boy, he became lieutenant in 1739 and post captain in 1742, and won his first honors through his brilliant participation in Hawke's victory of October 14, 1747, over the French fleet under L'Étendère. Having rendered valuable services in the English West Indies in 1761-62, he was in the latter year advanced to the vice-admiralty, and in 1764 made a baronet. In 1779, at the time of the alliance of Spain with France against England, Rodney, now admiral, received command of the fleet at the Leeward Islands station, with instructions also to relieve Gibraltar, besieged by the Spanish. After capturing seven Spanish ships of war bound for Cadiz, he fell in, January 16, 1780, with the Spanish admiral Langara, off Cape St. Vincent.

Of the Spanish fleet five vessels were captured and two destroyed. Having accomplished the relief of Gibraltar and Minorca, he quitted the Mediterranean, crossed the Atlantic to the station of his new command, and won an indifferent victory, near Martinique, over the French fleet under the Count de Guichen. The victory upon which his fame mainly rests was that won over the French fleet under De Grasse, off Dominica, April 12, 1782. The battle was more obstinately contested than any other engagement of the war, being kept up without intermission for nearly twelve hours. De Grasse was totally defeated, and made prisoner. Rodney's victory saved Jamaica and ruined the naval power of France and Spain. Meanwhile in England the North Ministry had fallen, and the Rockingham Ministry had sent Admiral Pigot to supersede Rodney for political reasons, before news of his great victory had reached London. As a reward for his services he was raised to the peerage as Baron Rodney, and given a pension of £2000 per annum for himself and his successors. He lived in retirement for the rest of his life and died May 23, 1792. Consult: Mundy, *Life and Correspondence of Admiral Lord Rodney* (London, 1830); Hamay, *Rodney* (ib., 1891).

RODOSTO, rō-dōs'tō. A town in the Vilayet of Adrianople, European Turkey, situated on the north shore of the Sea of Marmora, 78 miles west of Constantinople (Map: Turkey in Europe, P 4). It is surrounded by beautiful gardens, and has many mosques, several Christian churches, and a Greek school. Population, about 20,000, nearly half of them Greeks.

RODRIGUEZ, rō-drō'gēs. A small volcanic island in the Indian Ocean, about 370 miles east of the British island of Mauritius (q.v.), of which it is an administrative dependency (Map: World, Eastern Hemisphere, L 27). It covers an area of about 40 square miles, and has a good climate and a rich flora. There is a safe harbor on the northern coast. Population, in 1901, 3163, chiefly settlers from Mauritius.

ROD'WELL, JOHN MEDOWS (1808-1900). An English Orientalist, born at Barham Hall, Suffolk, and educated at Bury Saint Edmunds and at Gonville and Caius College, Cambridge. He took holy orders and for fifty-seven years was rector of Saint Ethelburga's, Bishopsgate. Rodwell was an accomplished Hebrew and Arabic scholar and translated the Koran (1861; 2d ed. 1876—the best English version), the Book of Job (1864; 2d ed. 1868), and Isaiah (1881; 2d ed. 1886), as well as liturgies from the Coptic (1866) and from Ethiopic manuscripts (1864).

ROE, EDWARD PAYSON (1838-88). An American clergyman and novelist, born in Moodna, Orange County, N. Y. Illness caused him to leave Williams College before graduation, but he afterwards received a bachelor's degree, studied at Auburn and Union Seminaries, and in 1862-65 was a chaplain in the volunteer service. He was from then until 1874 pastor of the Presbyterian Church at Highland Falls, N. Y., after which he gave himself up to lecturing, writing, and fruit culture. His first novel, *Barriers Burned Away* (1872), a story suggested by the Chicago fire, was followed by *Play and Profit in My Garden* (1872) and many novels, all

very popular in the United States, many of them reprinted in England, and some translated into German. Of these the chief are *What Can She Do?* (1873), *Opening of a Chestnut Burr* (1874), *From Jest to Earnest* (1875), *Near to Nature's Heart* (1876), *A Knight of the Nineteenth Century* (1877), *A Face Illumined* (1878), *A Day of Fate* (1880), *His Somber Rivals* (1883), *A Young Girl's Wooing* (1884), *An Original Belle* (1885), *Diveca Back to Eden* (1885), *He Fell in Love with His Wife* (1886), *The Earth Trembled* (1887). He wrote also *Success with Small Fruits* (1880) and *Nature's Social Story* (1884). Consult *E. P. Roe, Reminiscences of His Life*, by his sister, Mary A. Roe (New York, 1899).

ROE, FRANCIS ASBURY (1823-1901). An American naval officer, born in New York City. He graduated at the Naval Academy in 1848, in 1849 was dismissed from the service for disobedience, but was reinstated in 1850, and saw his first active service in 1854 against Chinese pirates. As executive officer he was on the *Peasecola* in its run down the Potomac in 1861, and he was with Farragut in 1862 and 1863. In 1864, commanding the *Sassacus*, Roe fought a sharp duel with the *Albatross* and forced its retreat. Toward the close of the war he was on duty in the Great Lakes. He was sent on a special mission to Mexico in 1867, received the surrender of Vera Cruz, and showed himself an able diplomat. He was promoted to the rank of rear-admiral in 1884, and retired in 1885.

ROE, RICHARD. See DOE, JOHN.

ROE, Sir THOMAS (c.1568-1644). An English diplomat, born at Low Leyton, Essex, and educated at Magdalen College, Oxford. He studied in France besides, and lived at Court in Elizabeth's last years. In 1610, five years after he was knighted, Prince Henry fitted him out for a voyage of discovery. Roe sailed up the Amazon and along the coast to the Orinoco, and made two more voyages in the 'Indies,' searching for gold. The East India Company sent him as ambassador to the Mogul in 1615. His successful negotiations are described in his *Journal*, published in 1625. In 1621 he was sent to Constantinople, and then described the Ottoman Empire as 'irrecoverably sick.' His mission was successful, as was one undertaken in 1629 to mediate between Sweden and Poland, and another in 1638-41 at the Diet of Ratibon. The Alexandrian manuscript of the Greek Bible, now in the British Museum, and an Oriental collection presented to the Bodleian Library, were brought to England by him.

ROEBER, rœber, FRIEDRICH (1819-1901). A German author, born in Elberfeld. He was a member of the Wuppertal group of poets in his youth. His *Lyrische und epische Gedichte* (1878) met with great success, but he is better known as a dramatist, the author of *Tristan und Isolde* (1854; revised 1885), *Sophonisbe* (1884), *Bürseninge* (1891), and *Antike Lustspiele* (1892). His further works include *Marionetten*, a romance (2d ed. 1885), and *Litteratur und Kunst im Wuppertal* (1886).

ROEBLING, rœbling, JOHN AUGUSTUS (1806-69). An American engineer. He was born at Mühlhausen, Prussia, and studied civil engineering at the Polytechnic School of Berlin. In 1831

he came to America and settled near Pittsburg, Pa. He was made assistant engineer on the slack-water navigation of the Beaver River. After similar engagements in other places, he was appointed to survey the route across the Alleghenies adopted by the Pennsylvania Railroad. He then began the manufacture of wire rope, and in 1841 he replaced the wooden aqueduct of the Pennsylvania Canal across the Allegheny River by a suspension aqueduct. Afterwards he constructed the Monongahela suspension bridge at Pittsburg, and from 1848-50 four suspension aqueducts on the Delaware and Hudson Canal. He established his works at Trenton, N. J., and in 1851 began the great suspension bridge over the Niagara River. In 1867 he began the Cincinnati suspension bridge, which has a clear span of 1067 feet. His last enterprise was the bridge across the East River, connecting Brooklyn and New York. The designs were completed and work had begun on the bridge when Mr. Roebling died from the result of an injury he had received while directing the construction. He published *Long and Short Span Bridges* (1869). See BRIDGE.

ROEBLING, WASHINGTON AUGUSTUS (1847—). An American civil engineer, son of John A. Roebling. He was born at Saxtonburg, near Pittsburg, Pa., graduated at Rensselaer Polytechnic Institute, Troy, in 1857, worked under his father on the Allegheny suspension bridge, and at the beginning of the Civil War entered the Federal army as a private in the Sixth New York Artillery. Save for the first year of his enlistment, he was on staff duty. After the evacuation of Yorktown he built a 1200 foot suspension bridge across the Rappahannock. In the second Bull Run campaign he built a bridge at Harper's Ferry across the Shenandoah River. While reconnoitring from a balloon, he is said to have first discovered Lee's movement from Fredericksburg toward Pennsylvania. On retiring from the army he undertook the completion of the Cincinnati and Covington bridge. Having spent some time in Europe studying pneumatic foundations, in 1869 he succeeded to the complete charge of the construction of the great New York and Brooklyn bridge. He considerably changed his father's plans, especially by increasing the size of the anchor plates. His devotion to the work and especially his almost continuous stay in the compressed air caissons proved too much for an already weakened constitution, and from 1873 to the completion of the bridge in 1883 he had to direct the work from his sick room. After 1883 he settled in Trenton, as head of the wire business established by his father.

ROEBUCK, JOHN ARTHUR (1802-79). A British politician. He was born at Madras, India, and passed his youth in Canada, where he was educated. In 1821 he went to England, studied law, and was called to the bar at the Inner Temple in 1831. Twice member of Parliament for Bath, in 1849 he was returned for Sheffield, which he represented till 1868, and again from 1874 until his death. In 1835, when the executive Government of Canada and the House of Assembly of Lower Canada were at variance, the latter body appointed Roebuck their paid agent in England, a position which involved him in a serious quarrel with the press. He warmly supported the Earl of Beaconsfield's

policy during the Eastern crisis in 1877-78, and in 1878 was made a member of the Privy Council. He was an active pamphleteer and the author of a work on the *Colonies of England* (1849), and of the *History of the Whig Ministry of 1830* (2 vols., 1832).

ROE DEER (AS. *rāhdēor*, from *rāh*, OHG. *rāh*, Ger. *Rh.*, Eng. *roe* + AS. *deor*, Eng. *deer*; connected with Skt. *rekha*, *lākha*, line, *rikh*, *likh*, to write, scratch). A European deer (*Capreolus caprea*), once plentiful throughout wooded regions as far east as Persia, and still to be found wild in thinly settled countries. The buck stands about 26 inches high, weighs about 60 pounds, and is tawny brown in summer, more dull and grizzled in winter, the lower parts and around the tail white; the tail is very short. The antlers of the buck are 8 or 9 inches long, erect, round, very rough, and have two sharp times (but no brow tine). The roe is not gregarious, and pairs are said to remain attached during life. The voice resembles that of

ROE DEER.

sheep, but is shorter and more barking. Another species of roe (*Capreolus pygargus*), rather larger than the common roe, is found in Tataria, and a third in Manchuria. Consult: Lydekker, *Deer of All Lands* (London, 1898); Adala, *Sport in Europe* (ib., 1901).

ROEDERER, *rô-de-râr'*, PIERRE LOUIS, Count (1754-1835). A French administrator and historian, born at Metz. He was elected to the Third Estate in 1789, and soon became well known as an administrative reformer. He became professor of economics in 1796, enjoyed Napoleon's favor, and in 1806 was appointed Minister of Finance in the Kingdom of Naples. Further advance was hindered by his opposition to the Continental blockade. Roederer sided with Napoleon in the Hundred Days and took no prominent part in politics after the Second Restoration, although he sat in the House of Peers in 1815 and after the Revolution of July, 1830. He wrote: *Mémoires pour servir à l'histoire de Louis XII. et François I.* (1825) and *Esprit de la révolution de 1789* (1831). His complete works were edited by his son (Paris, 1853-59).

ROEDIGER, *rô'di-gôr*, EMIL (1801-74). A German Orientalist. He was born at Sangerhausen, studied philology and theology at Halle, 1821-26 and became there privat-docent in 1828. He was appointed successively professor extraordinary (1830) and full professor (1835) of Oriental languages, and in 1860 accepted a similar position at Berlin, where he spent the rest of his life. Besides numerous papers on paleography and various Oriental topics published mainly in the *Zeitschrift für die Kunde des Morgenlandes* and the *Zeitschrift der deutschen morgenländischen Gesellschaft*, of which his *Litteraturberichte* in volumes v., viii., ix. and x. of the latter deserve

special mention, his main works were: *De Origine et Indole Arabicæ Librorum Veteris Testamenti Historicorum Interpretationis Libri Duo* (1829); an edition of Lokman's Fables (*Loemani Fabula*, 1830; 2d ed. 1839); *Chrestomathia Syriaca* (1838; 3d ed. by his son, 1892); *Versuch über die himjaritischen Schriftmonumente* (1841); *Wellstedts Reisen in Arabien, Deutsche Bearbeitung* (1842). He finished Gesenius's *Thesaurus Linguae Hebraicae*, which its author's death had left incomplete, and edited editions (14-21) of Gesenius's grammar (1845-72). He also assisted in the preparation of Payne Smith's *Thesaurus Syriacus*.

ROELAS, *rô-â-lâs*, JUAN DE LAS (called EL LICENCIADO, also EL CLÉRIGO ROELAS) (1560-1625). A Spanish religious painter, born at Seville, of a noble family. He studied painting probably in Venice, where he was much influenced by the works of Titian and of Tintoretto, of whose style his own is suggestive. Although he was one of the chief masters of Andalusia, his works were little known out of Spain until the nineteenth century, the finest of them being at Seville, notably his masterpiece, "The Transit of Saint Isidore," in the Church of San Isidoro; "Saint James in the Battle of Clavigo" (1609), in the Cathedral; and "The Martyrdom of St. Andrew," in the Museum. The Madrid Museum contains his "Moses Striking the Rock," the Berlin Museum a "Madonna Worshipped by a Jesuit," and the Hermitage, Saint Petersburg, the "Communion of Saint Theresa."

ROELOFS, *rô-ô-lôs*, WILLEM (1822-97). A Dutch painter, etcher, and naturalist, born at Amsterdam. Having begun his studies at Utrecht, he continued them at The Hague under Hendrik van de Sande-Bakhuyzen (1795-1860). In France he was much influenced by the painters of the "paysage intime," and he also roamed all over Holland, choosing the subjects for his paintings, in both oil and water colors, most frequently from the less known regions of his country. The Amsterdam Museum contains a "View near Abconde" and "View near The Hague"; the Rotterdam Museum a "Landscape with Cattle"; and the Liège Museum a "Forest in Autumn." Roelofs was also favorably known for his researches in entomology.

ROEMER, *rô-môr*, FRIEDRICH ADOLF (1809-69). A German geologist, born in Hildesheim and educated at Göttingen and Berlin. In 1845 he became instructor in mineralogy and geology at the Klausthal School of Mines, of which he was superintendent from 1862 to 1867. He was a pioneer in pointing the relation between Jurassic and Cretaceous formations in Germany with those in the mountains of Northern Germany. His works include: *Die Versteinerungen des norddeutschen Oolithengebirges* (1835-39); *Versteinerungen des norddeutschen Kreidegebirges* (1840-49); and *Beiträge zur geologischen Kenntniss des nordwestlichen Harzgebirges* (1850-66).

ROEMER, OLAUS, or OLE (1644-1710). A Danish astronomer, born at Aarhus, Jutland. He was educated at the Copenhagen University, and afterwards accompanied Picard to France, and was appointed tutor to the Dauphin by Louis XIV. He became eminent in astronomy and mathematics and was made a member of the Academy of Sciences in 1672. He was an asso-

ciate of Picard and Cassini in many investigations and discoveries. Roemer was the first to notice that light does not move through space instantaneously, but requires an appreciable interval of time for its transmission. (See ANNIHILATION OF LIGHT.) This far-reaching discovery is his principal claim to fame. (See SATELLITES.) In 1681 he returned to Denmark as professor of astronomy at Copenhagen, held several public positions, and finally became Chancellor of the Exchequer.

ROENTGEN, rönt'gen, WILHELM KONRAD (1845—). A German physicist, born at Lempe, in Rhenish Prussia. He received his doctor's degree in 1869 at the University of Zurich, where he studied under Kundt. He was afterwards professor at Hohenheim, Strassburg, and Giessen, and in 1885 he became professor at the University of Würzburg. In 1899 he was appointed professor of experimental physics at the University of Munich, a position which he now holds. In November, 1895, he read before the Physico-Medical Society of Würzburg a paper upon his discovery of the rays which bear his name. For this discovery he received many honors, including the Rumford Medal of the Royal Society of London and the Barnard Medal of Columbia University, awarded in 1900 for the greatest discovery in science during the preceding five years. (See X-RAYS.) He published, chiefly in the *Annalen der Physik und Chemie*, many articles on various physical subjects, including the properties of crystals, specific heat of gases, absorption of heat ray in vapors and gases, electrostriction, piezo electricity, various other electric and magnetic phenomena, and telephony.

ROERMOND, rōer'mōnt. A town in the Province of Limburg, in the Netherlands, situated at the confluence of the Roer with the Meuse, 28 miles northeast of Maastricht (Map: Netherlands, E 3). It contains a thirteenth-century Romanesque cathedral, a seminary, and a fine palace of justice. The manufactures of the town consist of woollens, cotton goods, paper, stone and wood carvings. Population, in 1900, 12,348.

ROESKILDE, rōs'kil'de, or **ROSKILDE**. A town on the island of Zealand, Denmark, situated at the head of the Roeskilde Fjord, 16 miles west of Copenhagen, at the converging point of the three principal railroad lines of Zealand (Map: Denmark, F 3). It contains a magnificent cathedral, erected 1074-84, rebuilt in the twelfth century, and containing the tombs of Danish kings. Population, in 1901, 8,368. Roeskilde is one of the oldest towns of Denmark. Previous to 1443 it was the capital of the kingdom and the residence of the royal family, but its decline was consequent on the rapid growth of Copenhagen, and fire and the ravages of the plague destroyed its prosperity. A treaty was concluded here in 1658 between Denmark and Sweden, in which the former relinquished her possessions beyond the Sound.

ROGATION DAYS (Lat. *rogatio*, supplication, from *rogare*, to ask). The Monday, Tuesday, and Wednesday before Ascension Day, so called because on these days the litanies (q.v.) are appointed to be sung or recited by the clergy and people in public procession. The practice of public supplications on occasions of public danger or calamity is traceable very early in Christian use; but the fixing of the days before Ascension

for the purpose is ascribed to Mamertus, Bishop of Vercen, in the middle of the fifth century, who, on occasion of a threatened earthquake or other public peril in his city, ordered a public procession and prayer, for the purpose of averting the danger. The usage in the Roman Catholic Church became general and permanent. The form of prayer employed is that known as the *Litanies of the Saints*. In England, after the Reformation, the recitation of the litanies upon these days was discontinued, but the days remain as days of fasting and prayer to obtain God's blessing upon the fruits of the earth; they form also a brief preparation, somewhat analogous to Advent and Lent, before the great festival of the Ascension.

ROGER (rōj'er) I. (Roger Guiscard) (c.1031-1101). Grand Count of Sicily, founder of Norman rule in that island. He was the youngest of the sons of the Norman noble Tancred de Hauteville (q.v.). In 1158, in answer to the summons of his brother, Robert Guiscard (q.v.), he went to Italy. On his arrival he was deputed by Robert to conquer Calabria, an achievement which was speedily executed. In 1060 he set out on an expedition against Sicily, then ruled by a number of Saracen chiefs, and by 1090 he had taken the most important towns, and ousted the Saracens from the control of the island. In 1092 he was invested by his brother with Sicily and part of Calabria under the title of Count. Roger divided the country into fiefs, which he distributed among his chief barons, whose relations to their subjects were regulated by him with justice and moderation. Moreover, he extended his own rule in Calabria. About 1096 he took the title of 'grand count,' to distinguish him from his vassals. Roger was courted by the most powerful princes of Europe. He fostered learning and was very tolerant in religious matters, protecting the Saracens within his dominions. He supported Rome against the Greek Church, and in 1098 Pope Urban II, in recompense for his fidelity to the Holy See, conferred the title of Papal legate upon him and his heirs forever. He died at Mileto, in Calabria, in July, 1101. Consult Schaek, *Geschichte der Normannen in Sicilien* (Stuttgart, 1889).

ROGER II. (c.1097-1154). Grand Count of Sicily from 1101 to 1130 and King of Sicily from 1130 to 1154. He was a son of Roger I. (q.v.). Upon the death of his brother Simon, he became the heir to Sicily, and during his minority the government was administered by his mother, a princess of Montferrat. When Roger had taken the supreme authority into his own hands, his first care was to extend his dominions. He compelled his cousin William to yield up the portion of Calabria and of the town of Palermo which Robert Guiscard had withheld from his father; and after the death of William (1127) he took possession of Apulia itself. Ambitions of the title of king, he supported the anti-pope Anacletus, his chief's uncle, and received from him the title of King of Sicily, with rights of suzerainty over the duchies of Naples and Calabria. In return, Roger established Anacletus on the pontifical throne in 1130. His bitter enemy, Innocent II, fell into his hands in 1139, and was compelled to withdraw the excommunications he had pronounced against Roger, and to consent to his retaining the territories he had acquired, obtaining by these means not only his own lit-

erty, and his recognition as lawful Pope, but also the firm attachment of Roger to the Holy See. In 1144 Roger received from Pope Lucius II, the right of using the various symbols of ecclesiastical dignity and power. In 1147 he began war on the Byzantine Emperor, Manuel Comnenus, who had been in the league with the Pope and the Emperor against him. Corfu was captured and Cephalonia, Negropont, Corinth, and Athens were pillaged. He followed up these successes by the capture of Tripoli and other places on the African coast, and afterwards attacked the Zeirides, leaving at his death an African dependency which stretched from Morocco to Kairwan. He died at Palermo, February 26, 1154. His daughter Constantia married in 1186 the Emperor Henry VI., whereby the Hohenstaufen succeeded in 1194 to the rule of the Two Sicilies. Consult Schack, *Geschichte der Normannen in Sicilien* (Stuttgart, 1889).

ROGER OF WENDOVER (c.1237). An English chronicler, monk of Saint Albans and for a time prior to Belyvoir. He transcribed the *Flores Historiarum*, a work supposed to have been compiled by John de Cella, and added to it an original chronicle from 1189 to 1235. The whole was revised and extended to 1259 by Matthew Paris. The work was edited by Coxe for the English Historical Society (1841-42), and by Hewlett in the Rolls Series (1886-89).

ROGERS, RÖJÖRZ, FAIRMAN (1833-1900). An American civil engineer, born in Philadelphia. He graduated at the University of Pennsylvania in 1853, and from 1855 to 1871 was professor of civil engineering in the University of Pennsylvania, of which he was long a trustee. Rogers served in the Civil War, in the Philadelphia City Cavalry, and as engineer on the staffs of General Reynolds and Gen. W. F. Smith. He was one of the charter members of the National Academy of Sciences. He wrote *Terrrestrial Magnetism and the Magnetism of Iron Ships* (1877; revised, 1883).

ROGERS, HENRY DARWIN (1806-66). An American scientist, born in Philadelphia. He studied at William and Mary College, and in 1830-31 was professor of chemistry and natural philosophy at Dickinson College, and then studied for two years in Europe. After his return he lectured at Franklin Institute in Philadelphia, and in 1835 became professor of geology at the University of Pennsylvania. The same year he made for the Government of New Jersey a geological and mineralogical survey of that State, publishing a full report in 1840. From 1836 to 1842, and again from 1851 to 1854, he was State geologist of Pennsylvania. In 1855 he removed to Edinburgh, Scotland, where the final report of his geological works was published under the title *The Geology of Pennsylvania, a Government Survey* (2 vols., 1858). From 1857 until his death he was regius professor of natural history in the University of Glasgow. Consult *Popular Science Monthly*, vol. I. (New York, 1897).

ROGERS, HENRY WADE (1853-). An American jurist, born in Holland Patent, N. Y. He graduated at the University of Michigan in 1874, and was appointed professor of law in its law school in 1883. After five years as dean of the same school he was elected president of Northwestern University (1890) and in 1901 became a

member of the Yale faculty of law. Rogers was chairman of the World's Congress of Jurisprudence and Law Reform at Chicago in 1893. He published *Illinois Citations* (1881) and *Expert Testimony* (1883).

ROGERS, JAMES EDWIN THOROLD (1823-90). An English political economist, born at West Meon, Hamp-shire. He was educated at King's College, London, and at Magdalen Hall, Oxford, where he graduated in 1846. He was ordained soon after his graduation, and took part in the High Church movement. In 1859 he was elected Tooke professor of statistics and economic science at King's College, and in 1862 was chosen Drummond professor of political economy at Oxford, but failed of reelection to that position in 1868. He then entered politics, and represented Southwark in Parliament from 1880 to 1885. In 1888 he was reelected professor at Oxford. Rogers was one of the pioneers in the study of English economic history. His researches were profound, and have furnished a vast amount of material for later writers, although his conclusions suffer from a tendency toward extreme partisanship. In his theoretical work he was a close follower of the *laissez-faire* school of classical economists, although he rejected some of the more important principles of that school, such as the Ricardian theory of rent. His principal works are: *Six Centuries of Work and Wages* (1885); *History of Agriculture and Prices in England* (1866, 1887); *First Nine Years of the Bank of England* (1887); *The Economic Interpretation of History* (1888); and *The Industrial and Commercial History of England* (published posthumously, 1892).

ROGERS, JOHN (c.1500-55). An English martyr, born at Deritend, near Birmingham, and educated at Cambridge. After being ordained he was a London rector, 1532-34, and chaplain to the English merchants at Antwerp, 1534-36, where he met William Tyndale, and renounced the Roman Catholic faith. In 1537 he became pastor of a Protestant church at Wittenberg. On the accession of Edward VI, he returned to England by invitation of Bishop Ridley, and became rector of Saint Margaret Moyses and Saint Sepulchre, in London, in 1550; in 1551 he was made prebendary of Saint Pancras, Saint Paul's, and rector of Chigwell, and in 1553 divinity reader. On the Sunday after the entrance of Queen Mary into London in 1553 he preached at Saint Paul's Cross, denounced Popery, and urged upon the people a steadfast adherence to the doctrines taught in King Edward's time. Summoned before the Privy Council, he ably defended himself, and was released; but on August 16th he was ordered to remain a prisoner in his own house, and deprived of all his emoluments. On January 27, 1554, he was removed to Newgate and treated with great severity. In January, 1555, he was tried before Gardiner, Bishop of Winchester, and on January 29 was condemned to be burned at Smithfield, London, which sentence was carried out on Monday, February 4th. He compiled the first authorized English Bible, prepared from Tyndale's manuscript and Coverdale's translation, which was published under the name of Thomas Matthew. It was printed at Antwerp by Jacob van Meteren. Copies of it in sheets were imported by Richard Grafton and sold in London 1537 (latest edition 1551). In Fox's *Martyr-*

ology are found an account of his examinations written while in prison, and other papers. Consult the *Life* by Chester (London, 1861).

ROGERS, JOHN (c.1572-1636). A Puritan divine. He was educated at Cambridge University, became vicar of Honingham, Norfolk, in 1592; vicar of Haverhill, Suffolk, in 1603, and from 1605 until his death was vicar of Dedham, Essex. He was a forcible preacher and his publications, which were valued highly by English Puritans, include *Sixty Memorials of a Godly Life* (n.d.); *The Doctrine of Faith* (1627); *Treatise of Love* (1629); *A Godly and Fruitful Exposition Upon All the First Epistle of Peter* (1650). His second son, NATHANIEL (1598-1655), was educated at Cambridge, where he graduated M.A.; became curate at Bocking, Essex, and rector of Assington, Suffolk, for five years, and in 1636 emigrated to New England, where he settled at Ipswich, Mass. He published a *Letter Discovering the Cause of God's Wrath Against the Nation* (1644).

ROGERS, JOHN (1829-1904). An American sculptor, born in Salem, Mass. He received his artistic training at Rome and Paris (1857-59). Upon his return to the United States he exhibited the "Slave Auction" (1860), which first brought him into prominence, and in 1860-65 he executed a series of war statuette groups in gray clay, among which were the "Picket Guard," "One More Shot," and "Union Refugees." His statuettes in green clay representing genre subjects, though very popular, cannot be classed as serious works of art. Among his works of this class are "Coming to the Parson" (1870), the "Charity Patient," and "Going for the Cows" (1873). Other statuette groups illustrate passages from Shakespeare, Irving's *Rip Van Winkle*, and Longfellow's *Miles Standish* ("John Alden and Priscilla"). His more ambitious efforts include the equestrian statue in bronze of General Reynolds (1881-83) in front of the City Hall, Philadelphia, and a bronze group of "Ichabod Crane and the Headless Horseman" (1887).

ROGERS, RANDOLPH (1825-92). An American sculptor, born at Waterloo, New York. When twenty-one years old he went to Rome, and studied with the sculptor Lorenzo Bartolini until 1850, when he returned to New York. In 1855 he went back to Italy and remained there the rest of his life. During his visit to New York he exhibited some statues which attracted attention, among them "Nydia, the Blind Girl of Pompeii," and a "Boy with a Dog." Among his notable works may be mentioned a statue of "John Adams" in the cemetery at Mount Auburn, near Boston; the bronze doors of the new Capitol extension in Washington, the bas-reliefs of which represent the principal events of the career of Columbus; the "Angel of the Resurrection" for the tomb of Col. Coll. at Hartford, Conn. (1861); and figures of Marshall, Mason, and Nelson for the Washington monument at Richmond, Va., which was left unfinished by Crawford at his death. Rogers was extensively employed on a series of colossal memorial monuments for various American cities, as at Providence, R. I. (1871); Detroit, Mich. (1873); and Worcester, Mass. (1874). His other works include a colossal bronze statue of Lincoln for Philadelphia (1871); the "Genius of Connecticut" for the State Cap-

itol in Hartford; and a statue of W. H. Seward in New York (1876). Rogers presented a complete collection of casts of his works to the University of Michigan.

ROGERS, ROBERT (1727-84). An American soldier, one of the best known figures in the history of American frontier warfare. He was born, of Scotch-Irish parentage, at Londonderry, N. H. In 1755, at the outbreak of the French and Indian War, he was commissioned captain of a company of rangers, which, under the name Rogers's Rangers, soon became widely known. During the year 1756, with Fort William Henry as his base of operations, Rogers made thirteen daring raids into the country about Ticonderoga. In a scouting expedition to the north of Ticonderoga in January, 1757, his hand was almost annihilated by a greatly superior force of Indians and Canadians. Later Rogers accompanied Lord Loudon on his abortive Louisburg expedition, and in March, 1758, he defeated a much larger force of the enemy near Ticonderoga. In August he repulsed an attack of the French under Marin near old Fort Anne. He took part in Wyeth's Quebec expedition, and later destroyed the village of the Abenakis, or Saint Francis Indians, who had long been the scourge of the New England frontier, though his own force was almost annihilated before he got back to the English outposts. In 1760 he was with Amherst at the capture of Montreal, and late in the year was sent to Detroit, which capitulated to him. For some time thereafter he lived quietly in New Hampshire, but in 1765 was in England, where he published his *Journal*, and also his more popular *Account of North America*. In 1766 he was made commander of the post of Michilimackinac, but two years later was sent in irons to Montreal on a charge of conspiring to turn the fort over to the French. He was acquitted by court martial, however, and in 1772-73 was in the Algerine service. At the outbreak of the Revolutionary War he was suspected of being a Tory, was arrested in Philadelphia in 1775, and was turned over on parole to the New Hampshire authorities by order of Congress, but escaped to New York, where he was given a colonel's commission by Lord Howe, and recruited the Loyalist regiment known as the "Queen's Rangers." He resigned, however, and went to England in the winter of 1776-77, but returned to America toward the end of the war, and for a time commanded a second Loyalist regiment, which he recruited in Canada. Although he is generally said to have died in London in 1800, according to a family tradition his death took place in 1781. His *Journal* (1765) contains valuable details of the French and Indian War. *A Concise Account of North America* (1765), intended to be a popular account of frontier life, particularly of the Indians, is a curious compound of fact and fiction. Rogers is also credited with the authorship of a tragedy entitled *Paribach; or the Savages of North America* (1776).

ROGERS, ROBERT WILLIAM (1864-). An American Orientalist, born in Philadelphia. He studied at the University of Pennsylvania, at Johns Hopkins, where he graduated in 1887, and at Leipzig and Berlin. After three years as professor of English Bible and Semitic history at Dickinson College, he was appointed to a chair of Hebrew and exegesis in Drew Theologi-

Summary. His chief publications are: *Two Treats of Esurhaddon* (1889); *Inscriptions of Sennacherib* (1893); *Outlines of the History of Early Babylonia* (1895); and *History of Babylonia and Assyria* (1900).

ROGERS, SAMUEL (1763-1855). An English poet, born at Stoke Newington, near London. His taste for literature and the company of literary men awoke at an early period, when he familiarized himself with Johnson, Goldsmith, and Gray. In 1786 he published his first book, entitled *An Ode to Superstition, and Some Other Poems*, followed in 1792 by *Pleasures of Memory*—the work on which his fame most securely rests. In 1803 he retired from active business on an income of £5000 a year, and built and adorned a house in Saint James's Place overlooking the Green Park, where he entertained many of the literary men of the time. His breakfasts became famous. After settling here, he published *Columbus* (1810; privately, 1808), a theme too large for him. In 1814 *Jacqueline* appeared in the same volume with Byron's *Lara*. In 1819 he issued *Human Life*, one of his best poems; and, in 1822, *Italy*. To this last poem a second part was added (1828). After this date Rogers wrote little, his time being mainly devoted to dining, epigram, and anecdote. In 1850 the laureateship was offered to him, but declined. He died December 18, 1855. No name occurs oftener than his in the literary annals of the time. Possessed of a large fortune, he befriended his poorer brethren; he obtained a pension for Cary and a position for Wordsworth, and healed the quarrel between Moore and Byron. The high place given him as a poet by his contemporaries he has not been able to maintain. Consult: Dyce, *Recollections of the Table-Talk of Rogers* (London, 1860); Clayden, *The Early Life of Rogers* (Boston, 1888); id., *Rogers and His Contemporaries* (London, 1889).

ROGERS, WILLIAM AUGUSTUS (1832-98). An American astronomer and physicist, born in Waterford, Conn. He graduated at Brown University in 1857, immediately became instructor, and in 1859 professor of mathematics at Alfred University, where, from 1866 to 1870, he was head of the department of industrial mechanics, and then became assistant in the Harvard Observatory. There he mapped a part of the skies north of the zenith and contributed to the *Annals* of the observatory. In 1886 he became professor of physics and chemistry at Colby University. Rogers's most important work was in metrology, and included the construction of a dividing engine of high precision, and standards of length, which were compared with the British and International prototypes, as well as with the United States standards.

ROGERS, WILLIAM BARTON (1804-82). An American scientist and educator, first president of the Massachusetts Institute of Technology. He was born in Philadelphia, a son of Patrick Kerr Rogers (1776-1828), then tutor in the University of Pennsylvania, and from 1819 to his death professor in William and Mary College, where his son graduated in 1822 and in 1828 succeeded him in the chair of natural philosophy and mathematics. During the seven years that he held this post he began with his brother Henry a minute study of the geology of Virginia. From 1835 to 1853 as professor of natural philosophy in the University of Virginia he extended this work

and became head of the State Geological Survey; the *Papers on the Geology of Virginia* (1884) give the results of this period, in which he was assisted by his three brothers, Robert Empie Rogers having become professor of chemistry and materia medica at the university, in 1842, and Henry Rogers being State geologist of Pennsylvania. As a geologist his work was remarkable for its conscientious foundation on observed facts. Rogers removed to Boston in 1853; as inspector of gas and gas meters reformed the system of inspection (1861); and in 1859 began to urge the establishment of a technical school. For this institution he drew up a scheme in 1860, repeating the outline he had made in 1846, and in 1862 received a charter. In 1865, after a year in Europe to study apparatus, he saw the actual establishment of the Massachusetts Institute of Technology (q.v.) and was appointed its president and professor of physics and geology. He introduced laboratory instruction in physics, chemistry, mechanics, and mining. In 1878, after a forced retirement of several years, he returned to his work, and in the following year succeeded Joseph Henry in the presidency of the National Academy of Sciences. From the presidency of the Institute of Technology he resigned in 1881; in the next year he fell dead on the platform while making an address to the graduating class. Rogers wrote *Strength of Materials* (1838), and *Elements of Mechanical Philosophy* (1852), as well as many papers for scientific associations. Consult his *Life and Letters*, edited by his wife and William T. Sidgwick (Boston, 1897).

ROGET, rō'zhá', PETER MARK (1779-1869). An English physician and scholar, born in London. He studied medicine at the University of Edinburgh, and removed to Manchester, where he became physician to the lunatic asylum, the fever hospital, and the infirmary. He settled in London in 1808 and was long the secretary of the Royal Society. Among his works are *Animal and Vegetable Physiology* (1834), and a *Thesaurus of English Words and Phrases* (1852), which passed through twenty-eight editions in the author's lifetime, and, as edited by his son in 1879, is still in use.

ROGIER, rō'zhyá', CHARLES (1800-85). A Belgian statesman, born at Saint-Quentin, France. He studied law at Liège and was admitted to the bar, devoting himself, however, with greater zeal to journalistic campaigns against the Dutch rule in Belgium. Upon the outbreak of the insurrection at Brussels in August, 1830, Rogier raised a band of 300 men and entered the capital, where he gained note as one of the most active among the patriot leaders. He became a member of the provisional Government established in October, and after the election of Leopold of Saxe-Coburg as King, in June, 1831, was made Governor of Antwerp. He left this post in October, 1832, to assume the portfolio of the Interior in the Goblet-Devaux Cabinet, and signaled his term of office by bringing into existence the Belgian railway system. He left the Cabinet in 1834 for his old position of Governor of Antwerp, but reentered the Ministry in 1840 as head of the Department of Public Works and Education. The Ministry fell in 1841 and Rogier was the leader of the Liberal Opposition in the Chamber of Deputies till 1847, when he was called upon to form a Ministry, in which he held

the portfolio of the Interior. French influence forced his retirement in October, 1852, but he returned to power in November, 1857, and remained in office for eleven years, acting as Minister of the Interior till 1861, and after that as Minister for Foreign Affairs. As Foreign Minister he conferred an inestimable advantage on his country by obtaining the consent of the great powers to the opening of the Scheldt to navigation. Consult Descailles, *Charles Rogier, 1800-85* (Brussels, 1896).

ROHAN, rô'ân'. A celebrated French family (named from the little town of Rohan, in Brittany), dating from the twelfth century, and tracing its descent to the royal and ducal line of Brittany. Its two most noted members are given below.

ROHAN, HENRI, Duke de (1579-1638). A French Huguenot general, son of Duke René II. and of Catherine de Parthenay, noted as the heroine of La Rochelle, heiress of the House of Soubise (q.v.). He was born at the Château de Blain in Brittany. About 1595 he was sent to the Court of Henry IV., and in 1597 distinguished himself at Amiens in the King's presence. Then he spent more than two years in travel through Germany, Italy, Holland, England, and Scotland. In 1603, soon after his return to France, he was made duke; two years afterwards he married the daughter of the King's great minister Sully; but he did not come into prominence until the death of Henry IV., when the leadership of the Protestant party fell to him. At Saumur in 1611 he effected a union of all the Huguenot factions; and in the same year he decided openly for Condé against Maria de' Medici, with whom he came to an understanding in 1616. But his efforts for union were unavailing, and, upon the rising of the Gascons and Béarnois against the reestablishment of the Catholic Church among them, he took the field openly, raised the siege of Montauban and forced the signature of the Peace of Montpellier and the confirmation of the Edict of Nantes (1622). He was made Marshal of France by Louis XIII., but Richelieu's policy was heedless of the treaty, and the Protestants rose again in 1625 under the lead of Rohan and his brother, the Prince de Soubise. Peace was made in 1626, but the struggle was soon renewed, ending in the triumph of the royal cause (1629). Rohan was named generalissimo of the Venetian troops in 1631; then returned to France and after a brilliant campaign drove the Austrians and Spanish from the Valtelline (1635); and, after a brief retirement in Geneva, joined Bernhard of Weimar in 1638. In that year he was mortally wounded at Rheinfelden. Rohan wrote *Mémoires* (1644), describing his three campaigns in France; an account of his travels in 1598-1600 (printed 1646); *Les intérêts des princes* (1666); *Traité du gouvernement des treize cantons* (1644); *Discours politiques* (1693); and a fourth book of *Mémoires* on the war in the Valtelline (1785). Consult Laugel, *Henri de Rohan* (Paris, 1889).

ROHAN, LOUIS RENÉ EDOUARD, Prince de (1734-1803). A French cardinal, born in Paris. He was bred to the Church, and was made Ambassador to Austria in 1772. He was recalled in 1774, having made himself offensive to Maria Theresa by his meddling spirit

and scandalous mode of life. He became grand almoner of France, cardinal in 1778, and Bishop of Strassburg the next year. He was imprisoned (1785) for his participation in the affair of the diamond necklace (q.v.), and on his release was dismissed from Court in disgrace. He was a Deputy to the States General in 1789, but retired on account of accusations of dishonesty. He resigned the Bishopric of Strassburg in 1801.

ROHDE, rô'dé, ERWIN (1845-98). A German classical scholar, born in Hamburg, and educated at Bonn, Leipzig, and Kiel. In the last named of these universities he became docent in 1870 and professor in 1872, and from 1876 to 1886 held chairs at Tübingen, Leipzig, and Heidelberg. He was an authority on the Greek novel and on the Greek cult of ghosts, and to these two subjects his great works, *Die griechische Roman* (1876), *Psyche* (1890-94), and the posthumous *Kleine Schriften* (1904), are devoted. Rohde wrote *Friedrich Creuzer und Karlom von Teublerode* (1896).

ROHILKHUND, or **ROHILKHAND**, rô'hil-künd'. A division of the United Provinces of Agra and Oudh (q.v.), British India, occupying, together with the native State of Rampur, an area of 11,824 square miles. Population, in 1901, 6,010,527. The principal town is Bareilly.

ROHLFS, rô'f's, ANNA KATHERINE (GREEN) (1846-). An American novelist, daughter of J. Wilson Green, a lawyer of Brooklyn, N. Y. She married Charles Rohlf's in 1884. She was educated at Ripley College, Poughkeepsie, N. Y., and gained immediate popularity by her first novel, *The Leavenworth Case* (1878), in which she combined remarkable ability in the construction of plot with considerable knowledge of criminal law. Of many later stories, all in the same vein, the best are: *A Strange Disappearance* (1879); *The Sword of Damocles* (1881); *Hand and Ring* (1883); *The Mill Mystery* (1886); *Behind Closed Doors* (1888); *The Forsaken Inn* (1890); and *The Filigree Ball* (1903). Other books are: *Rosini's Daughter*, a drama in blank verse (1880); *The Defense of the Bride*, a dramatic poem, together with other verses; and a dramatization of *The Leavenworth Case* (1892).

ROHLFS, GERHARD (1831-96). A German explorer, born April 14, 1831, at Vegesack, near Bremen. After serving in the Schleswig-Holstein War in 1849 he took up the study of medicine and from 1855 to 1860 participated in the French wars in Algeria as a surgeon in the Foreign Legion. In 1861-62 he explored Morocco in the disguise of a Mohammedan, and penetrated the desert hinterland to the oasis of Falfel. Setting out from Tangier in 1863, he was the first European to reach and describe the oasis of Tawat. Shortly after his return to Germany in 1865 he set out again for Africa, this time planning a journey through the heart of the Sahara and the Sudan. He traversed the desert from Tripoli to Lake Chad, visited the Central African States of Bornu and Sokoto, and, entering the Niger by way of the Benue, sailed down that stream to Kribba, whence he forced his way through the forests to the Guinea coast. In 1868 he accompanied the British expedition to Abyssinia and after 1869 explored Cyrenaica and the oasis of Jupiter Ammon, traversing the Libyan desert whither in 1873-74 he led a second expedition.

equipped by the Khedive of Egypt. In 1878 he set out from Tripoli on a semi-official mission to the Sultan of Wadai, but, owing to the hostile attitude of the desert tribes, was compelled to turn back at Kutra. The long list of his works comprises: *Reise durch Marokko* (1869); *Land und Volk in Afrika* (1870); *Von Tripolis nach Alexandria* (1871); *Über durch Afrika* (1874-75); *Beiträge zur Entdeckung und Erforschung Afrikas* (1876); *Reise von Tripolis nach der Oase Kufra* (1881); *Quid Nari et Africa* (1886).

ROI D'YVETOT, LE (Fr., the King of Yvetot). The title of a poem by Biranger (1813), telling of the contented King of the insignificant little medieval principality of Yvetot, near Rouen. The King of Yvetot's happy though inglorious life was intended to satirize Napoleon's insatiable love of glory for which the nation paid so heavily. The name has since been used of petty princes with great pretensions.

ROI S'AMUSE, rwä sä'muz', LE (Fr., the King amuses himself). A drama by Victor Hugo produced in 1832. The King, Francis I., is ruled in his excesses by his buffoon Triboulet, whose daughter Blanche he seduces. In revenge Triboulet plans the murder of Francis at a low tavern he frequents, but when he plunges his victim in a sack, he finds it is Blanche who had followed her lover and met her death. The story was used by Verdi as the basis for the libretto of his opera *Rigoletto* (1851), Francis appearing as the Duke of Mantua.

ROIS EN EXIL, rwä zän nög'zél', LES (Fr., Kings in Exile). A story by Alphonse Daudet (1879), dealing with the misfortunes of crowned heads, and notable in its close study of character and motive.

ROJAS, rō'hās, FERNANDO DE. A Spanish writer, who flourished about 1500; the author of the greater part if not the whole of the famous dramatic novel entitled the *Tragicomedia de Calisto y Melibea*, also known as the *Celestina*, a work produced first in 1499. Nothing is known of the life of Rojas beyond the fact that he was a bachelor of laws. According to a statement made in the preface of the work by Rojas himself, he was only continuing the work of another man, who had written the first act of the *Celestina*. Despite its title, the *Celestina* is not a drama; it is properly a novel in dialogue, and as such it had a very great influence upon the later novel and drama of Spain. Consult the edition of the *Celestina* in the *Biblioteca de autores españoles*, vol. iii. and M. Menendez y Pelayo's essay on Rojas in his *Estudios de crítica literaria* (Madrid, 1895).

ROJAS ZORRILLA, thō-rō'lyä, FRANCISCO DE (1607-c.1660). A Spanish dramatist. He belongs to the second half of the *siglo de oro*, the age of Calderon, and produced plays in collaboration with that illustrious poet, with Velez de Guevara, and with Mira de Amescua, as well as notable original comedies. He also cultivated the sacred play or *auto*. The best known of his pieces is that entitled *Del rey abajo ninguno*, still interesting on the stage. Other noteworthy comedies of Rojas are *Lo que son mujeres* and *Entre bobos anda el juego*. He himself published two volumes of his works, comprising some twenty-four plays, in 1640 and 1645. Some of

his more important plays are to be found in the *Biblioteca de autores españoles*, vol. xxxix. (Madrid, 1866).

ROKITANSKY, rō'kē-tän'skē, KARL, Baron (1804-78). An Austrian pathologist, born in Königgrätz, Bohemia. He studied medicine in Prague and Vienna; was appointed assistant to the chair of pathological anatomy in the University of Vienna in 1828, and professor in 1834, retiring in 1875. He occupied several municipal medical positions. In 1869 he was elected president of the Austrian Academy of Sciences. Rokitansky, more than any other one man, deserves the credit of establishing the scientific study of medicine upon the basis of pathological anatomy. He published *Handbuch der pathologischen Anatomie* (3d ed. 1851-61; Eng. trans. 1849-52), which embodied his teachings. Consult anonymous biography (1874).

RO'LAND, Fr. pron. rō'län', THE SONG OF. An old French epic poem or *chanson de geste* of the end of the eleventh century, pronounced by competent critics one of the masterpieces of French literature. The work, consisting of 4002 assonant verses in decasyllabic form, arranged in *laissez* or stanzas of varying length, takes its name from its chief character, Roland, prefect of Brittany, and, according to tradition, nephew of Charles the Great. Nothing definite is known concerning its author, though some commentators identify him with a certain *Turoldus* mentioned in the last verse. The narrative of the poem runs briefly as follows: Charles, King of the French, has for seven years successfully fought the 'Saracens' of Spain. News of his victories reaches Marsile, commander of the infidels, who, fearing for his own sceptre, sends messengers to the French to sue for peace. After deliberation, Charles appoints Ganelon, the personal foe of Roland (here represented as Roland's stepfather), to arrange terms with Marsile. Incited by his bitter hatred of Roland, Ganelon seizes the opportunity to gratify his desire for vengeance. Having reached the 'pagan' court, he artfully proposes to Marsile to betray the French rearguard under Roland into Marsile's hands, when the main army of Charles shall be fairly on its way home. The plan is accepted; Ganelon returns to Charles, and the French army crosses the Pyrenees into France, while Roland remains behind in the mountains with a guard of twenty thousand men. At Roncevaux, or as the text says Ronecvaux (the plain of Ros), he and his valiant band are overwhelmed by a 'pagan' army of twenty times their number. The details of this disaster, which Europe regarded during centuries as the representative struggle of Christian against Moslem, constitute the kernel and real beauty of the poem. The effect of the drama is heightened by making the heroic but reckless Roland in part responsible for the catastrophe. His boon companion Oliver, whose courage is second only to his prudence, in three beautiful *laissez* (each on a different assonance) beseeches Roland to wind his horn and bring Charles to the rescue. Only when his doom is complete, when his companions, the twelve peers of France, including the warlike Bishop Turpin, lie slain about him, will Roland raise the horn to his lips and summon his liege with his dying breath. The poem then draws rapidly to a close. Charles, at whose prayer the Almighty arrests

the sun in its course, reënters Spain on the same day, utterly routs the 'pagans,' and returns to France, sorrowful but triumphant. At the tidings of Roland's death, Aude, his betrothed (Oliver's sister), falls lifeless at the Emperor's feet. Ganelon is finally found guilty by the 'judgment of Heaven' and is condemned to be torn limb from limb by infuriated stallions.

In this form the *Chanson de Roland* was carried to almost every nation in Europe. It was put into German verse by a certain Conrad about 1130, later into Norse prose and into English verse; the story early penetrated to Italy; it was known to Dante, and after several recastings it was adapted to the national character by the poets Pulci (*Morgante maggiore*), Boiardo (*Orlando innamorato*), Ariosto (*Orlando furioso*), and Berni (*Orlando amoroso*). In Spain national jealousy displaced religious zeal. Roncevaux became a Spanish victory, and the dawn of Spain's national glory. Finally the legend cast abroad the names of its heroes, some of which became localized in foreign parts, notably 'Roland' in Northern Germany about Bremen. The legend is also the theme of several operas.

The historical facts underlying the story are told by Einhard, the biographer of Charles the Great. He relates that on August 15, 778, while passing through a defile of the Pyrenees, part of the French army was attacked by the mountaineers, the Basques, who, owing to their light armor, gained an easy victory. In this battle perished "Eggihard, provost of the royal table; Anselm, count of the palace; and Roland (*Hruotlandus*), prefect of the March of Brittany." This is the sole dictum of history on the hero's character. But two Latin works, a chronicle of the twelfth century attributed to Turpin, and a poem *De Proditione Guenonis* of the same date, reveal two versions of the legend preceding that represented by the French poem. From evidence in these works it is held that the legend of Roland was first fashioned in Brittany, recast in Anjou, and given its present form in the country surrounding Paris or the *Ile de France*. The best manuscript of the French poem is the famous "Digby 23" of the Bodleian Library, Oxford; it is apparently in the writing of a scribe of the middle of the twelfth century.

As a literary production, the *Chanson de Roland* is worthy to be classed with the two other great mediæval epics, the *Beowulf* and the *Nibelungenlied*. Doubtless they are both its superiors on the æsthetic and human sides; each of them is a more or less complete expression of a past stage of civilization, whereas the *Roland* represents only a part of the French nation, the feudal *barons*. Yet, in its rough grace, it excels them both in directness, and, above all, in the expression of a national spirit.

BIBLIOGRAPHY. Consult: Seelmann, *Bibliographie des altfranzösischen Rolandliedes* (Heilbronn, 1888). The best editions of the text are by Gautier (Tours, 1899); by Müller (Göttingen, 1878); by Stengel (Leipzig, 1900). For criticism consult especially G. Paris, *Poèmes et légendes du moyen âge* (Paris, 1900). Translations: J. O'Hagan (London, 1880) in the metre of "Christabel"; Rabillon (New York, 1888) in blank verse; an excellent German translation is that of William Hertz (Stuttgart, 1861); and by far the best in modern French is the blank verse translation of Joseph Fabre (Paris, 1902).

ROLAND DE LA PLATIÈRE, de la plâtière, JEAN MARIE (1734-93). A French politician, born at Uzay, near Villefranche (Yonne). He was early forced to shut for himself, but succeeded in becoming an authority in matters pertaining to industry and commerce and received an appointment as inspector-ordinary of manufactures at Amiens. In 1775 he met Marie-Jeanne Philipon, a young woman twenty years his junior, of brilliant talents and fascinating beauty, and they were married February 4, 1780. When the Revolution broke out in 1789, Roland, who was then living at Lyons, became a decided partisan of the movement. In 1791 he was sent to Paris by the municipality to present to the Constituent Assembly the deplorable condition of the Lyonnese weavers. After the dissolution of the Constituent Assembly, he founded at Lyons the Club Central, the members of which, marked by their attachment to constitutional liberty, received the name of Rolandins. To end the close of 1791 he settled in Paris, and soon became one of the recognized leaders of the Girondists. In March, 1792, he was appointed Minister of the Interior, a post which, with the exception of the period between June 10 and August 10, 1792, he held till January, 1793, when he resigned in despair of seeing moderate counsels adopted. Upon the fall and proscription of the Girondists, he fled and concealed himself in Rouen. When news reached him of the execution of his wife, he committed suicide at a small village in the environs of Rouen, November 15, 1793. Roland wrote and published several memoirs and disquisitions on branches of industry, the most important work being the *Dictionnaire des manufactures et des arts* (Paris, 1785-90). His letters to his wife before they were married have also been published in part.

ROLAND DE LA PLATIÈRE, MARIE or MANON JEANNE PHILIPON, Madame (1734-93). A leader of society at the time of the French Revolution. She was the daughter of Pierre Gratien Philipon, an engraver, and was born in Paris, March 17, 1734. At an early age she showed great precocity, being especially attracted by the works of great poets and moralists. When eleven years of age she entered a convent school in Paris, but soon returned to her parents and gave herself up to fresh reading and study. She was speedily attracted by the philosophical ideas of Rousseau and the Encyclopedists. In 1780, after a friendship extending over five years, she married Jean Marie Roland de la Platière, and her subsequent career is closely identified with his political life. During the Revolution she became prominent in Parisian literary and political life, and her *salon* was frequented by Brissot, Buzot, Pétion, and other Girondist leaders. After the fall of the Girondists and Roland's flight from Paris, his wife continued to support the lost cause. She was arrested June 4, 1793, and lodged in prison, where she spent her time in writing her *Memoires* (4 vols., edited by Dauban, Paris, 1861). She also composed four letters to Buzot, who alone of her admirers had awakened deeper sentiments than those of friendship. Their mutual love had been, however, a blameless one. After a summary trial before the Revolutionary Tribunal, Madame Roland was led to the guillotine and bravely met death, November 8, 1793. Consult: Dauban, *Étude sur Madame Roland*

(Paris, 1864); Blind, *Madame Roland* (ib., 1886); Lamy, *Deux femmes celebres* (ib., 1886); Sainte-Beuve, *Portraits de femmes*; Dobson, *Four Elizabethan Women* (London, 1890). Madame Roland's *Letters* have also been published (Paris, 1867).

ROLFE, rôlf, JONX (1585-1622). An English colonist in America, born in Norfolk, England. He became interested in the colonization of Virginia, and in June, 1609, started for the colony, but was wrecked on the way, was detained for some months on the Bermuda Islands, and did not reach Jamestown until May, 1610. He is credited with having been the first Englishman, in 1612, to introduce the cultivation of tobacco in Virginia. He had married an English woman in 1608, but his wife had died soon after her arrival at Jamestown, and in April, 1613, he married the famous Indian 'princess' Pocahontas, whom he took to England in 1616. After the death of Pocahontas, in 1617, Rolfe returned to Virginia, where he again married, and in 1619 was a member of the Council. See POCAHONTAS.

ROLFE, JOHN CAREW (1859—). An American classical philologist, born at Lawrence, Mass. He received his bachelor's degree from Harvard University in 1881, and attained the doctorate in philosophy at Cornell in 1885. In 1888-89 he was a member of the American School at Athens and assisted in important excavations during that year. He taught at Cornell University from 1882-85 and at Harvard University in 1889-90. In the latter year he was appointed assistant professor at the University of Michigan, and four years later was made professor of Latin. This office he continued to hold until 1902, when he was appointed to a similar position at the University of Pennsylvania. He became co-editor with Prof. Charles E. Bennett of Cornell of the *College Latin Series*, and edited various Latin texts for schools and colleges.

ROLFE, ROBERT MONSEY, Baron Cranworth. See CRANWORTH.

ROLFE, WILLIAM JAMES (1827—). An American Shakespearean scholar and educator, born in Newburyport, Mass. Rolfe graduated B.A. at Amherst in 1849. He taught in Maryland, then at Wrentham, Dorchester, Lawrence, and Salem, and from 1862 to 1868 in Cambridge, Mass. Having resigned this post, he became editor of the *Popular Science News* and afterwards of the Shakespearean department of *The Literary World* and *The Critic*. Early in his career he edited selections from Ovid and Vergil, and, in collaboration, *The Cambridge Course of Physics* (6 vols., 1867-68). Many contributions by him are scattered through the *North American Review*, *Harpur's Magazine*, and other periodicals. His Shakespearean work began with an edition of George L. Craik's *English of Shakespeare* (1867). This led to the preparation of a complete edition of Shakespeare (40 vols., 1870-83), a revision of which began to appear in 1903. He also edited the *Select Poems of Goldsmith* (1875), of *Gray* (1876), and of *Tennyson* (1884); *The Princess* (1884); *Mrs. Browning's Sonnets from the Portuguese* (1887); *Enoch Arden and Other Poems* (1887); *Scott's Complete Poems* (1887); *A Blot in the 'Scutcheon and Other Dramas of Browning* (1887); *Byron's Child Harold* (1887); *Minor Poems of Milton* (1887); *Macauley's Lays of Ancient Rome*

(1888); *Wordsworth* (1888); *In Memoriam* (1895); *Idylls of the King* (1896); and a complete edition of *Tennyson* (10 vols., 1898). Other books are: *Shakespeare the Boy* (1896); *The Elementary Study of English* (1896); *Life of Shakespeare* (1901); and *A Satchel Guide to Europe*, published anonymously for twenty-seven years.

ROLL, rôl, ALFRED PHILIPPE (1847—). A French genre and portrait painter of the Naturalistic School, born in Paris. He was the pupil of Harpignies, Gérôme, and Bonnat. Many of his subjects are taken from the life of the peasant. These include "The Strike" (1880), in the Museum of Valenciennes and "Work" (1885). "The Centenary of the 5th of May, 1779, at Versailles," "War" (1887), and "The National Fête of the 14th of July, 1880," are other notable canvases, which show his power of depicting several figures in action. He was influenced by the Impressionists to the extent that he rarely painted any figure except out of doors. His "In Normandy" (1883); "Manda Lamétrie, fermière" (1888), in the Luxembourg; "The Exodus"; and the superb "Woman with a Bull" (1889) are examples of his delicate handling of light. His skill as a draughtsman is best exhibited in "The Joys of Life" (1892-96), a decorative painting in the Hôtel de Ville, Paris. He also painted portraits. Consult *Foureaud, L'auteur de Alfred Philippe Roll* (Paris, 1896).

ROLLE, rôl, RICHARD, OF HAMPOLE (c.1290-1349). An English recluse and author, born at Thornton, in Yorkshire. He studied theology at Oxford, but he left the university at the age of nineteen, and became a hermit. He moved about in the north, settling eventually in a cell at Hampole, near Doncaster. He was famed for his learning, preaching, and holy life. Rolle composed many treatises both in Latin and in English, some of which yet remain in manuscript. His English works, written in the Northumbrian dialect, were widely read. Most popular was *The Pricke of Conscience* (ed. R. Morris for the Philological Society, 1863), a poem of 9624 lines rhyming in pairs. It gives a complete view of human life from the extreme ascetic standpoint. Other English works by Rolle are a paraphrase of the *Psalms and Canticles* (ed. by Bramley, Oxford, 1884); *English Prose Treatises*, ten in number (edited by Perry for the Early English Text Society, London, 1866); and the *Miscellanies* edited by Horstmann, under the title *Richard Rolle of Hampole and His Followers* (2 vols., London, 1895-96). Two of the Latin treatises—*De Emendatione Vita* and *De Incendio Amoris*, translated into English by Richard Misyng in the fifteenth century, were edited by R. Hardy for the Early English Text Society (London, 1896). Rolle's English works are of great philological interest as specimens of the English written in the North.

ROLLER. A bird of the family Coraciidae, related to the broadmouths, todies, and motmots. All the many rollers are inhabitants of the warm and forested parts of the Old World, and are noted for gorgeous coloring. They take their name from a habit of tumbling in the air like a tumbler-pigeon, and have a curious habit of tossing their food, which consists of insects and parts of plants, into the air, and catching it in their mouths. One only is found in Europe, the

common roller (*Coracias garrula*), a bird nearly equal in size to a jay. Besides the genus *Coracias*, there are the broad-billed rollers of the genus *Eurystomus*, found in Africa and tropical Asia, and at least four genera of remarkable rollers confined to Madagascar.

ROLLERS. See ROAD AND STREET MACHINERY.

ROLL WORM, or ROLLWORM. The larva of a hesperid butterfly (*Ludanus proteus*), which rolls the leaves of beans and peas in the Southern Atlantic States. The large eggs are laid upon the leaves in clusters of from four to six. The larva, which is yellow-green and has a slender neck and large head, cuts a slit in the leaf from the edge, rolls the flap around its body, and works from the inside of this roll with its soft parts perfectly protected. When fully grown it is 1.5 inches long, and transforms to a chrysalis within the leaf-roll. The adult butterfly is dark brown, the front wings having several silvery white spots. In a small garden it may be kept in check by hand-picking, but the use of an arsenical spray is necessary in large fields.

ROLLETT, HERMANN (1819-1904). An Austrian poet and art critic, born in Baden, near Vienna. Because of the radical tone of his political poetry, *Frühlingsboten aus Oesterreich* (1845), published while he was in Germany, he was forbidden to return to Austria, and was later expelled from several German States. His principal works are: *Frische Lieder* (1848, 2d ed. 1855); *Republikanisches Liederbuch* (1848); *Die Kirmes*, a series of songs, with music by Abt (1854); *Offenbarungen* (2d ed. 1870); and *Marchengeschichten aus dem Leben* (1894). Rollett wrote some dramas and also two valuable works on art, *Die drei Meister der Gemmogenyptik* (1874), and *Die Goethe-Bildnisse* (1882).

ROLLIN, ROLAND, CHARLES (1661-1741). A French historian, born in Paris. He studied at the Collège du Plessis, where, in 1683, he became assistant to the professor of rhetoric, and five years later he was made professor of eloquence in the Collège de France. In 1694 he was chosen rector of the University of Paris, a dignity which he held for two years, distinguishing himself by many useful reforms. In 1696 he was appointed coadjutor to the principal of the Collège de Beauvais; but being an ardent Jansenist, he was removed in 1712, through the influence of his opponents. In 1715 he published an edition of Quintilian, and in 1726 the *Traité des études*, his best literary performances. After a long life of retirement devoted to writing and study, Rollin died in Paris, September 14, 1741. His most famous work is the compilation, formerly of great popularity, known as the *Histoire ancienne* (13 vols., Paris, 1830-38), which has frequently been reprinted and reedited both in French and in English, but is of little historical value. He also began a *Histoire romaine*, which was completed by Crevier and other historians after Rollin's death, and was published in 9 volumes (Paris, 1738-48).

ROLLIN, LEDRU. See LEDRU-ROLLIN.

ROLLING MILL. An establishment provided with machinery for working metal ingots into rails, bars, plates, rods, and structural shapes by repeatedly passing them when intensely hot between cylindrical rolls. The three principal

methods of working metals are founding, forging, and rolling, and of these three methods that of rolling has been chiefly instrumental in extending the use of metal for structural purposes to its present enormous dimensions. The rolling mill was invented by Henry Cort an Englishman, in 1783, and although wonderfully developed in its essential principle, the *three-high mill* has undergone but little change since its invention. Rolling mills may be classified as two-high mills, three-high mills, and four-high mills, with their modifications. The accompanying diagrams show the principle of operation of each of these mills. Fig. 1 indicates a *two-high mill*, in which the metal passes between

the two rolls in the direction indicated by the lower arrow and has work done on it, and then is returned over the rolls as indicated by the upper arrow for the second pass. In the *three-high mill*, indicated by Fig. 2,

FIG. 2

the metal passes forward between the bottom and middle rolls and is returned between the middle and top rolls and has work done on it in both the forward and return passes. The *four-high mill*, as shown by Fig. 3, consists essentially of two two-high mills placed one above the other nearly, and working in opposite directions so that the metal is acted upon during both the forward and return

passes. In actual practice the four-high mill is seldom used. The original mill invented by Cort was a two-high mill operating as indicated by Fig. 1. As will be seen, the metal after each forward pass had to be returned over the top of the mill, without any work being done on it, to get it into position for the next forward pass. This operation, it will be readily understood, necessitated a material loss of time and heat while the metal was being returned for each succeeding pass through the rolls. The first great improvement of the two-high mill was designed to avoid these losses and consisted in operating

FIG. 3

the rolls by a reversing engine, which, as soon as the metal had completed the forward pass, reversed the direction of the rotation of the rolls and permitted the metal to be returned between them. The chief disadvantages of reversing were that more expensive engines were required, the whole machinery had to be heavier and more costly in construction, and the expense of repairs was greater. The three-high mill, as will be seen from Fig. 2, has the great advantage over the two-high mill that the rolls operate all the time in one direction. On the other hand, the metal has to be lifted for each return pass. In modern rolling mill practice, the lifting is done by hand when light material such as rods, bars, hoops, etc., is being rolled and by machinery when the material is heavy.

The construction of a set or stand of rolling-mill rolls is quite simple. The rolls are made of chilled cast iron turned to cylindrical form and are journaled at their ends in a strong frame or housing of cast iron. It is essential above all things that this housing shall be strong and rigid and so constructed that the rolls can be taken out and repaired or changed quickly and easily. Sometimes the rolls are so fixed and adjusted in the housing that their distance apart can be quickly increased or decreased while they are in place, and at other times they are placed in the housing in a definite fixed position which cannot be changed during operation. The housing is founded on a structure of masonry set below the mill floor. In finishing mills for light work the engine is sometimes connected only to one roll, the other roll being turned by the friction of the metal as it passes between the two. For heavier work both rolls are positively operated direct from the engine. The simplest form of roll is a plain cylindrical one for rolling plates. For rolling nearly all other forms of rolled shapes the metal has to be confined laterally, and to accomplish this the rolls are provided with grooves varying in shape according to the finished form it is desired to secure. Generally each set of rolls has two or more grooves, each set of which approaches closer to the form of the finished section than the set of grooves preceding it, and the metal is passed through these grooves in order. Commonly also several sets of rolls are employed, each set of which brings the piece closer to its final form than the set preceding. In certain kinds of work the several stands of rolls are so arranged that the rolling process is continuous. For example, in rolling round rods for wire-drawing, the billet from the blooming mill passes through one groove, then is looped and returned through another, and so on until the final groove of the final stand of rolls produces the finished rod of small diameter. In the universal mill largely used in rolling plates the metal is compressed laterally by means of a pair of vertical rolls set close behind the horizontal rolls. There are also special forms of mills for rolling wheel tires, hoops, and other special shapes.

The mills of the Pencoyd Iron Works, at Pencoyd, Pa., may be described as typical of modern practice. The steel ingots as produced by the steel plant (see IRON AND STEEL) are delivered by electric traveling cranes and cars to the pit furnaces of the blooming mill, where they are subjected to the first rolling process to reduce them to blooms and billets. The blooming mill is a two-high reversing mill, and the ingots are delivered to it and manipulated between the different passes by 'tables' operated by hydraulic power from a central station. These tables raise, turn, and shift the piece transversely or longitudinally as desired. This mill is fed with hot ingots by four vertical pit furnaces of the regenerative type fired with producer gas, and in turn it supplies three finishing mills and an axle forge. The principal part of the product goes to the beam mill, which is supplied with hot blooms. The beam mill is placed in the line of the delivery of the blooming mill and is served with three regenerative heating furnaces for restoring full working temperature to the blooms on their passage from the blooming mill. The billets are charged into and withdrawn from these furnaces by machinery. The beam mill

consists of two distinct mills, one a roughing mill for roughly forming the beam and the other a finishing mill. The roughing mill is a two-high reversing mill and the finishing mill is of the three-high type. The roughing mill is served with reversing tables and hydraulic manipulators, while the finishing mill has traveling tables which also have a lifting movement. The product of the finishing mill is delivered by live rollers to saws and shears, thence to cooling beds, straightening machines and shears, and finally to the storage yards. From the time the ingot leaves the steel mill until the finished beam is in the storage yard it is handled wholly by machinery. The foregoing is a typical example of the perfection of modern rolling-mill practice in producing structural iron and steel. In rolling rails the billet from the blooming mill passes directly to a three-high rail mill.

STEEL SHAPES. The shapes turned out by the modern rolling mill are limited only by the fact that they must in each case be of uniform section throughout the length of the piece, and the fact that the roller grooves cannot be wider at the bottom than the top. The more common standard shapes are plates, flats, squares, rounds, half-rounds, angles, channels, I beams, Z bars, T iron,

STRUCTURAL STEEL SHAPES.

trough shapes, rails, and bulb angles. In structural work these direct shapes are riveted together to form the various compound shapes used for columns for buildings, bridge members, etc. The literature on rolling-mill construction, equipment, and practice exists almost wholly in the shape of special articles in the *Proceedings* of the various engineering societies and in the columns of the engineering papers.

ROLLO. HROLF, ROLF, or ROT (real name HROLFE, known as the Ganger, or Walker). A Norse chieftain of whose early history nothing definite is known. He seems to have effected extensive conquests in Northwestern France, and by the Peace of Clair-en-Epte, about 912, he was granted by King Charles the Simple of France the possession of Rouen and the adjacent territory which he already held. This was the origin of the Duchy of Normandy. Rollo was baptized with many of his companions. He divided his lands among his followers, framed laws for his people, and made great donations to the Church. He was a faithful ally of Charles the Simple. By successful wars he gradually extended his possessions. About 927 he associated his son William Longsword with himself as ruler. He

died about 931. Consult Freeman, *The Norman Conquest*, vol. i. (Oxford, 1867). See NORMANS.

ROLLS. The records of the ancient English courts. The term originated at a time when bookbinding was not common, and it was the custom to write the records of court proceedings upon sheets of parchment, which were tacked or fastened together and rolled up. See RECORDS, PUBLIC.

ROLLS, MASTER OF THE. See MASTER OF THE ROLLS.

ROM, or ROMANY. See GYPSIES.

ROMAGNA, rô-mă'nyă. A territorial division of Italy which formed part of the Papal States (q.v.). It embraces the provinces of Bologna, Ferrara, Forlì, and Ravenna.

ROMAGNOSI, rô-mă-nyô'zê, GIOVANNI DO MEXICO (1761-1835). An Italian jurist, born at Salsomaggiore. He was educated at Piacenza, and became instructor in law at Parma (1803), and in 1806 professor of law at Padua. The downfall of Napoleon caused him to leave the last place and he became professor of law at the University of Corfu in 1824. Romagnosi in his teaching extolled society as the natural condition of man, upheld the State against the individual, and repudiated the contract theory of the origin of society. His two most important works are the *Genesi del diritto penale* (1786) and *Introduzione allo studio del diritto pubblico universale* (1805). His *Opere* were published at Florence in 1832-35. While imprisoned by the Austrians in 1800, Romagnosi is said to have anticipated Oersted in the discovery of the magnetic needle.

ROMAIC (ML. *Romaicus*, from Gk. Ῥωμαϊκός, *Rhōmaïkós*, Roman, Latin, Byzantine, from *Rōma*, *Rhōmē*, Lat. *Roma*, Rome, later also Byzantium). The vernacular language of modern Greece. See the section on *Modern Greek* in the article GREEK LANGUAGE.

ROMAIC LITERATURE. The modern Greek literature. It is commonly regarded as belonging to the period that begins after the overthrow by the Turks of the Byzantine Empire in A.D. 1453. But the beginnings of Romaic literature considered as the written expression of Romaic speech must be sought at least three centuries earlier. Theodoros Prodromos (Ptochoprodromos), who flourished in the first half of the twelfth century, has been considered the first modern Greek writer. His begging poems, written in the so-called political verse and in the vulgar language, are a most interesting literary and linguistic monument. But Prodromos is by no means the first Romaic writer. The popular epic material out of which the metrical romance of Diogenes Akritas was afterwards constructed appears to belong to an earlier period, and Romaic prose documents composed in Lower Italy carry us back to the tenth century. The metrical *Chronicle of the Conquest of the Morea*, which deals with the foundation of the feudal principalities in Greece after the Fourth Crusade, was composed before 1326. In the earlier period, as it may be called, of Romaic literature, Constantinople, Cyprus, and Crete appear to have been the chief centres of production. Didactic, erotic, and allegorical poetry, legal and historical writings in prose, are among the forms of literature represented. To a Cretan poet of

Venetian origin, Amencio Cornaro, who flourished apparently about 1550, belongs with some right the title of the modern Homer. His long roman, the poem *Leucippe*, in which, in the medieval manner, the loves of Leucippe, the son of an Athenian councillor, and Antus, the daughter of Hercules, King of Athens, are narrated, is still a great favourite with the Greek populace. Greek prose writing in the fall of Constantinople to the hands of the eighteenth century represents substantial, but far from brilliant, and in paganism of a low level, in the literature and scholarship. But during the period of Turkish rule, particularly in Northern Greece, a mass of most striking and interesting popular poetry, composed and transmitted in written, was accumulating. In this popular poetry the life, the emotions, the superstitions of the Greek people are reflected. In the so-called Klepotic songs, in which is vividly portrayed the spirit of the wild mountaineers of Thessaly and Epirus, who are sometimes a sort of local police and tax-gatherers, sometimes brigands, we find expressed that love of liberty and hatred of the oppressor which were to culminate in the Revolution of 1821. Noteworthy among these poems is the *General of Olympus and Kissavos* (1851), which was translated, together with other popular Romaic poems, by Goethe. Of others of the poems "love and love's pain" is the burden; of yet others, death and Charos, the modern Greek death-god, are the theme. The prophet of the spirit of liberty, which was gaining greater power under the influence of the French Revolution, was Rhegas of Velestinos (Pheræ) (1754-98). Rhegas, who lived in the service of the Greek Hospodar of Wallachia and who paid the price of his patriotism with his life, is the author of the rousing war-song, "Oh, sons of the Hellenes!" The stirring poem, "How long, palliards?" is also commonly ascribed to him. Of a different type was the man who has been often regarded as the modern Greek Anacreon, Athanasios Christophos (1770-1847), who spent what would seem to have been an epicurean existence at Bucharest, imitating the *Anacrentica* in Romaic and troubling himself little about the regeneration of Greece. Noteworthy also is the satiric fabulist Ioannes Velaras of Epirus (1773-1823), who was physician to Veli Pasha, son of the intamous Ali Pasha of Janina. Among the cultivators and developers of Romaic prose style, a very prominent place should be given to the first great modern Greek scholar, Adamantios Korais (Oray) (1748-1833), who left his mark upon classical as well as modern Greek philology. He took a middle position in the strife that arose at the beginning of the revival of national life between the purists and the vulgarists in Romaic speech and writing. The current Greek style of to-day occupies in general this vague middle ground, but the most vital and original literature of the Greeks is still, in poetry at least, in the vulgar tongue.

It was in this tongue, and in that form of it which was current in the Ionian Islands, that the great poet of the Greek Revolution, Dionysios Solomos, wrote. Solomos is a writer of real and eminent genius. He was born in Zante, in 1798, was educated in Italy, where he studied law at Venice, Cremona, and Padua, and developed his literary knowledge and poetic talent by association with the poets of the day, particularly Monti, and by reading the Italian

classics. On his return to Zante in 1818 he began to study popular Romaic poetry with the practical help, it is said, of an old blind minstrel. The Klephtic lays were a new inspiration to him. Perhaps the greatest production of Solomos's genius is his *Hymn to Freedom*, the composition of which was prompted by the first triumphs of the Greek Revolution. Not the least striking passage in this great poem is that in which the innumerable company of the ghosts of those that had been "slain by Turkish wrath" inspire by their unfelt touch the sleeping Greek army before Tripolitza. The *Hymn to Freedom* has been set to fit music and is now the national hymn of Greece. The poem *On the Death of Byron* is also a noble work, though written in a difficult and involved style. Among the shorter poems of Solomos may be mentioned *The Poisoned Girl*, weirdly pathetic; *The Blood Girl*; and the six lines—a true *multum in parvo*—on the island of Psara after its devastation by the Turks. Solomos died in 1857, in Corfu, where he had spent the latter part of his life. To what may be called the school of Solomos belong Julius Tzypaldos of Cephalonia (1814-83) and G. Markoras of Corfu (1826—). A poet of distinct merit, who belongs to the western islands, but drew his inspiration as well as his blood from the hardy Epirotes, is Aristoteles Valaorites of Santa Maura (Leucas) (1824-79). Another poet, able but too much influenced by the puristic style, is George Zalakostas (1805-58). Of merit, too, as a lyric poet, is Achilles Paraskhos (1833-95). Among the numerous Greek poetical writers of lesser merit since the Revolution may be mentioned the widely learned and over-classical Alexander Rizos Rangabes (Rangabé) (1810-92), who devoted himself to various fields of literature, and Alexander Soutsos (1808-63), who contributed by his satiric verse to the unpopularity of the unfortunate President Capodistria. Demetrios Bikelas, of whom more must be said presently, is better known as a prose writer than as a poet, although he has written graceful verse and made poetical translations of a number of Shakespeare's plays. Another writer of verse holds a unique place in modern Greek literature. This is George Sourès, who for many years published weekly a small, four-page, satirical paper, the *Ψωμάς*, roughly illustrated by himself and written in clever doggerel. His very personal, slashing satire, combined with poetic talent, caused Sourès to be called by some the modern Aristophanes. In dramatic writing, as in fiction, the modern Greek writers have for the most part owed far too much to French models; but the comedy *Βαβυλωνία*, published in 1836 by D. K. Byzantios (a painter by profession), in which a comical entanglement is caused by the failure of the several characters rightly to understand one another's dialect and which contains a good deal of clever satire on the confused state of the modern tongue, should not be passed over. Worthy of mention, too, are the comedies of Angelos Vlakhos (published 1871). A very prominent place in modern Greek fiction is held by Demetrios Bikelas, who was born at Hermopolis, in Syra, in 1835. His *Διηγήματα* (Stories) give us vivid glimpses of the life of the Ægean Islands. They have been gracefully translated in-

to English (from the French edition) by Opdycke, under the title *Tales from the Ægean* (Chicago, 1894). A brief but vivid picture of Western Greece is presented in Bikelas's letters to a friend, entitled *Ἀπὸ Νικοπόλεως εἰς Ὀλυμπίαν* (*From Nicopolis to Olympia*), which have also appeared in a French version. Here may be mentioned as other important modern Greek historical works the elder Tricoupi's *History of the Greek Revolution* and Paparrhegopoulou's *History of the Greek People*. An historical novelist, as well as a literary critic of keen taste and sound judgment, is Emmanuel D. Rhoides, author of *Ἡπίσσια Ἰωάννα* (*Pope Joan*), a Rabelaisian historical satire published in 1867. Ordinary Greek journalism, generally of a very inferior sort, hardly falls, for the most part, within the scope of a survey of modern Greek literature; but mention should be made of the *Ἔσρα*, an excellent literary journal published at Athens. In the domain of scholarship the Greeks have accomplished much, notably in archaeology and philology. The National University, founded under Otto, the first King of the Greeks, has in its faculties men of international fame. Among these is the greatest living native scholar in later Greek, Hatzidakis. Constantine Kontos, who taught for many years at the university, was closely associated with the Dutch philologists, especially Cobet. The *Δόσιος Ἐπιμής*, in the composition of which he was assisted by Cobet and Badham, the *Ἔωστικά Παρρηρήσεις* (aiming at the purification of the modern written language), and numerous contributions to the learned periodical *Ἄθηνά* are monuments of Kontos's great scholarship.

BIBLIOGRAPHY. Krumbacher, *Geschichte der byzantinischen Litteratur* (2d ed., Munich, 1897; excellent, with very full bibliography); Nicolai, *Geschichte der neugriechischen Litteratur* (Leipzig, 1876; valuable for bibliography); Rangabé, *Précis d'une histoire de la littérature néo-hellénique* (Berlin, 1877); Dieterich, *Geschichte der byzantinischen und neugriechischen Litteratur* (Leipzig, 1902). The first and most extensive collections of Romaic popular poetry are those of Fauriel, *Chants populaires de la Grèce moderne* (Paris, 1825; with French translations, and an excellent *Discours préliminaire*), and Passow, *Popularia Carmina Græcæ Recentioris* (Leipzig, 1860). For modern Greek folk-poetry, besides these two collections, should be consulted: Stuart-Glennie, *Greek Folk Poetry* (Guildford, 1896; contains a large number of verse translations), and Abbott, *Songs of Modern Greece* (Cambridge, 1900).

ROMAINE, rô-mân', WILLIAM (1714-95). An English clergyman noted for his 'evangelical' and Calvinistic preaching. He was born at Heathpool, the son of a French Protestant refugee. He was educated at the grammar school of Houghton, graduated at Christ Church, Oxford, 1734; was ordained in 1738, and immediately obtained a curacy near Epsom. In 1748 he published the first volume of a new edition of Calasio's *Hebrew Concordance and Lexicon*, the fruit of seven years' labor. The same year he was chosen lecturer of Saint Botolph's, in London, and in 1749 lecturer of Saint Dunstan's-in-the-West. In 1750 he was appointed assistant morning preacher at Saint George's, but was afterwards deprived of the situation by the

rector, Dr. Trebeck, who was jealous of his popularity and averse to the 'plainness' of his preaching. His 'evangelicalism' grew with his years and at length, in 1757, in a sermon on *The Lord Our Righteousness*, it became so offensive to the dons of Oxford that the university pulpit was in future closed against him. In 1756 he became curate and morning preacher at Saint Olave's, Southwark, in 1759 at Saint Bartholomew the Great, near West Smithfield. In 1766 he was chosen by the parishioners rector of Saint Andrew of the Wardrobe, and Saint Anne, Blackfriars, both in London, an office which he held till his death. His works were republished in a collected form, in 8 vols., in 1796, by Cadogan, with a life of their author.

ROMAN, rō'män, or **ROMANU**. A town of Rumania, capital of the district of the same name, 35 miles west by south of Jassy, near the confluence of the Moldava and Sereth rivers (Map: Balkan Peninsula, F 1). The bishopric of Roman dates from the early fifth century. Population, in 1899, 14,019.

ROMAN, rō'män', *Fr. pron. rō'män'*, ANDRÉ BIENVENU (1795-1866). An American political leader. He was born in Opelousas Parish, La., and was the son of a French Creole sugar planter. He graduated at Saint Mary's College, Baltimore, in 1815, and soon afterwards settled on a sugar plantation in Saint James Parish, La. From 1831 to 1835 he was Governor of the State, and while holding that office he brought about the formation of a State agricultural society, the building of a penitentiary at Baton Rouge, the granting of \$20,000 to Jefferson College, and other important public measures. He was again Governor from 1839 to 1843, and did much to prevent the repudiation of the State debt. In 1845, and again in 1852, he helped to draw up new State constitutions. In politics he was a Whig, and he was strongly opposed to secession, but as a delegate to the Convention of 1861 he acquiesced in the withdrawal of the State from the Union. Later in the same year he was one of the three commissioners sent to Washington by the Confederate provisional Government to negotiate peaceful separation. He was too infirm to take an active part in the conflict that followed, but was a strong supporter of the Confederacy.

ROMAN ART. Although the Romans affected to despise the practice of the arts and displayed little artistic taste in their earlier history, they developed, nevertheless, a distinctly national art under the late Republic and the Empire, largely by the hand of artists of Greek race, and produced in architecture types which have been in use for nearly twenty centuries. The history of Etruscan art dates from the period previous to the campaigns against the Greek cities, the conquest of which opened up the sphere of Greek art and ushered in the Hellenic period, which continued until the time of Augustus. It was during and after the reign of Augustus that the colossal undertakings of the Imperial period reached the unity of a national style throughout the Empire. The century and a half that followed was the golden age. The decay set in before the time of Septimius Severus and was complete in the time of Constantine except in point of practical constructive ability.

ARCHITECTURE.

PRE-ROMAN. Central and Southern Italy abound in ruins of elaborately fortified cities antedating B.C. 500, often more imposing and complete than the ruins of Mycena or Troy, e.g. Norba, Minturn, and Segunt. The earliest temples (seventh century) remotely resembled the Greek in having a cella and portico, and in the use of a primitive and clumsy quasi-Doric order, the Tuscan, but they were built chiefly of wood, with terra cotta ornaments, fragments of which have been found on many sites, as at Saturnia, Minturn, and Falerne. In Etruria and parts of Umbria peopled by the Etruscan race architecture and decoration were further advanced, though the temples were mainly of the type just described, with terra cotta sculptures, even in Rome almost to the time of the Empire (Temple of Jupiter Capitolinus). Underground domes and vaults abound. Especially noticeable are the tombs at Tarquinii, Cerveterium (Clusium), Perugia, and other sites, of elaborate design and sumptuous interior decoration, often representing the manners and customs of daily life. It is to the Etruscans that Roman architecture owes its arches and vaults.

ROMAN ARCHITECTURE. When, under the Republic, pure Greek influence became firmly established in Rome through the conquest of Southern Italy, Greece, and Asia, the Romans employed Greeks and their pupils to put up their first stone and marble temples of Tuscan, Doric, Ionic, and Corinthian orders in place of the earlier Etruscan temples of wood and terra cotta. But wood continued in use for theatres, circuses, and amphitheatres almost until the Empire. The aqueducts that dotted the Roman Campagna were the most impressive of the works of Republican Rome. The old Tabularium on the Capitol, the only remaining civil building of the Republic, shows how the Romans had already learned to combine their native style of arcades with the Greek orders. In three stories of arched openings, each arch is flanked by engaged half-columns supporting an entablature at each story-level. This combination became classic and was followed throughout the Empire. The theatre of Marcellus, the Colosseum, the Basilica, and many other buildings were erected after this plan, using the Greek orders as a decorative adjunct to the Roman arched and vaulted constructions. The use of concrete (opus caementicium), which became general in the reign of Augustus, enabled architects to raise domes and vaults far larger than would have been possible with stone, and to produce a kind of architectural grandeur never dreamed of in earlier ages. Internal spaciousness and loftiness constituted a new artistic resource, which the world owes to the Romans.

The temples were no longer the paramount monuments. They were built on various plans, the most common having a high basement or podium and short cella with deep porch; they were often barrel-vaulted and without a peristyle, the flanks and porch being adorned with engaged columns (Maison Carrée at Nîmes; temples of Fortuna Virilis and of Faustina at Rome). Some were round (temple of Vesta, with enclosing colonnade; Pantheon with rectangular porch). Later temples were of colossal size, like the double temple of Venus at Rome, and the temples at Baalbek and Palmyra. Open

these temples the Romans carried purely ornamental decoration to a far higher degree of magnificence than the Greeks, as in the temples of Baalbek, and those of Castor and of Faustina in Rome. They used the Corinthian and Composite in place of the plainer Doric and Ionic orders, and adorned the interiors of their basilicas, baths, and palaces with incrustations of marble and mosaics in a great variety of colors.

But although the Pantheon (q.v.) is one of the grandest structures extant, it was in their civic buildings that the Romans especially excelled; in their basilicas, vast halls, sometimes open, sometimes roofed or vaulted, for all sorts of public assemblies; in their fora, their miles of colonnades affording sheltered passage through the streets, and in their colossal public baths (e.g. of Caracalla or of Diocletian), which could accommodate many thousands of bathers, and whose courts, exedras, and halls—the latter of colossal size—were adorned internally in the most sumptuous manner with marble pavements and incrustations, mosaic, and delicate stucco relief in color. The Forum of Trajan, with its colossal memorial column, arch of triumph, basilica, and temple, was a stupendous aggregation of architectural splendor. The Roman triumphal arches (see ARCH, TRIUMPHAL) and columns have set the type for all subsequent works of this kind, and Roman sepulchral art was also remarkably successful, especially in tombs of moderate size. Monumental splendor, grandeur of scale, sumptuousness of decoration, the Romans achieved in architecture to a degree which has made their work the study and inspiration of later ages.

This Greco-Roman style spread rapidly over the whole Empire. In remote provinces the Roman army was employed in the erection of buildings and even entire cities, skilled designers being attached to each legion. New cities arose in Syria and Africa, with their amphitheatres, theatres, baths, and arches. The cities of Asia Minor were so thoroughly reconstructed that the remains of their earlier Greek architecture have disappeared under a mass of ruins of the Roman period, full of Hellenic spirit. Southern France became a great centre of Roman culture. The Pont du Gard, the amphitheatre and theatre at Arles, the arch and monument at Saint-Remy, the theatre at Orange, the gates, temple, baths, and amphitheatre at Nîmes, are impressive works of the golden age, and are better preserved than the monuments of Rome itself. In Spain and in Rhenish Germany are important remains, like the Alcántara bridge and the Porta Nigra at Trier.

In Italy itself, notwithstanding the wholesale destruction of the Renaissance, many works of first-class importance remain outside of Rome, too numerous to catalogue here. In Northern and Central Italy we may mention only the amphitheatre at Verona, the temple of Minerva at Assisi, the stupendous ruins of the Villa of Hadrian at Tivoli. The south of Italy, especially the region about Naples, has the most interesting monuments outside of Rome, such as the great amphitheatres at Capua, Puteoli, and Casinum (Cassino), the noble Arch of Trajan at Benevento, and finally the unrivaled ruins at Herculaneum and Pompeii. For both public and

domestic Roman architecture of the best period, Pompeii is the great storehouse, because it presents a complete provincial city. See POMPEII.

In North Africa the French have unearthed a series of ruined Roman cities of great architectural interest. The cities of Thysdrus, Sufetula, Lambessa, and Tingad, nearly all built between about A.D. 150 and 250, abound in materials for study—basilicas, arches, temples, gates, fora, and tombs. The Roman remains in Syria may be divided into two classes: the reign of old Syro-Hellenic culture from the coast to the cities of Damascus, Antioch, and Edessa, and the inland region along the desert line, where the Romans were first to establish cities. (See PALMYRA.) It is the desert cities that have kept their ruins most intact—Petra, Palmyra, Baalbek (Heliopolis), Jerash (Gerasa), and many smaller towns. The colonnades and temples at Palmyra of late date are among the most colossal of Roman ruins. In Asia Minor the largest temple was that of Hadrian at Cyzius; all the theatres (except that of Priene) are Roman, and that at Aspendus is the best preserved anywhere. Roman work is often interwoven with Greek, as at Pergamum, Magnesia, Aizani, Ephesus.

The buildings of Rome itself are too well known to require enumeration. Nearly all the types of temples are well represented. The theatre of Marcellus, the mausoleum of Hadrian, the Colosseum, the Roman Forum, and the later more formal and regular Forum of Trajan; the triumphal arches of Titus, Septimius Severus, and Constantine; the sculptured memorial columns of Trajan and Marcus Aurelius; scanty remains of basilicas, that of Maxentius being the most important; the Imperial palaces, on the Palatine; the Tabularium, the Senate House (S. Adriano), the Admiralty (Neptunium); the camp of the Praetorians; the Imperial baths of Titus, Trajan, Caracalla, and Diocletian; the unrivaled tombs of the Via Appia and the Via Latina are the most conspicuous examples of their several types. Constantinople was the field where the latest stage of Roman architecture was best displayed, while Rome itself was in decadence. Its memorial columns of Arcadius and Theodosius, its hippodrome, forum, basilicas, theatres, aqueducts, walls, were the greatest products of the fourth century, beginning with Constantine. Their inferiority in style as well as construction is marked.

Roman architecture remained by no means stationary during the four centuries of the Empire. In constructive skill, composition, and the union of sculpture with architecture there was almost continuous progress from Augustus to Trajan, when Roman art reached its perfection. Then began, with Hadrian, a decline in taste and in constructive refinement. But in bold, effective composition and daring construction there was, if anything, an advance; witness the baths of Diocletian and the basilica of Constantine. Reviewing Roman architecture as a whole, the world is more indebted to it than even to Greece for fertility and variety of invention. We have been ever since living on this technical and ideal inheritance.

SCULPTURE AND PAINTING.

The development of sculpture in Rome was relatively late. The chief incentive of Greek

sculpture, the decoration of temples, was originally absent at Rome, and sculpture for a long time found its principal channel in portrait statues, required by the ancestor worship and self-glorification of Roman citizens. This tendency was fostered by the custom of keeping the images of ancestors in the houses and bearing them in funeral processions, and the practice early arose of erecting honorary statues to distinguished citizens. Mythological subjects were not much represented until the reign of Augustus, but here Greek originals were merely copied. At first bronze was the favorite material, and sculpture in the round the only form practiced, but with the advent of Greek influences marble became more common. The great architectural works of the Imperial period, the amphitheatres, baths, basilicas, bridges, etc., called for the decoration with innumerable statues. Specially Roman are those fine combinations of architecture, the triumphal arches, commemorative columns, and the like, in which the sculpture relief received a development which made it, next to portraiture, the most characteristic form of Roman art.

ETRUSCAN EPOCH. As in the architecture, the first influences in Roman sculpture and painting were Etruscan. (See ETRURIA, paragraph on *Archæology and Art*.) Recent discoveries under the *Lapis Niger* in the Roman Forum (1899-1900) show that as early as the sixth century B.C. statuary and other objects of art were imported from Etruria. There are hazy traditions also of Greek artists in Rome, as Damophilus and Gorgasus, who decorated the Temple of Ceres in B.C. 493, but until the end of the third century the chief influence remained Etruscan. The innumerable bronze statues with which the Forum was adorned were practically all of Etruscan origin.

THE GREEK EPOCH. The conquest of the Hellenic world, beginning with the capture of Tarentum in B.C. 275, opened the eyes of the Romans to the charm of Greek sculpture and painting, and Rome soon became a veritable museum of masterpieces torn from Greek temples and palaces. Every general brought back ship-loads of art works as a part of his booty. The decorations of the Temple of Honor and Virtue (B.C. 207) were carried off from Syracuse by Marcellus; those of the Temple of Fortune (B.C. 173) were seized from that of Juno Lacinia on a promontory between Crotona and Sybaris. Fulvius Nobilior built a temple to Hercules and the muses as a resting place for their statues captured in the Ætolian War, and when the rude Mummius took Corinth (B.C. 146), he gave his soldiers a free hand to sack the city of its art treasures. The crude Etruscan art was eclipsed and forgotten, but the Romans could only admire—not imitate—the Greek works that met them on every side. Greek artists of the later school flocked to Rome—Pasiteles, Stephanus, Menelaus, Arcesilaus—and their works found admirers as readily as those of Myron and Praxiteles. In fact, the popular taste called rather for the vigorous and the sensual than the ideal, and loved the Pergamene School, the ‘Medici’ Venus, and the Tortured Marsyas, which the *ateliers* of the day turned out in great numbers. The very large majority of ancient statues that fill our museums are works of this and the following periods.

GRECO-ROMAN EPOCH. The first two centuries of the Empire continued without limit the repre-

sentation of Greek artistic types, but from the end of the Republic there grew up, almost unperceived, a new spirit, which may be called distinctly Roman, and which showed itself especially in realistic portraiture and in historical sculptured reliefs. The Greek conception of a portrait statue or bust was largely ideal, as in the Alexander, sons of Lycurgus. Roman portraiture was a development of Etruscan art, and under the Republic was represented by the *unicuique maneræ* or wax masks, which hung in the atria of noble houses. The “Young Augustus” and the armored statue of the same Emperor from Prima Porta represent Roman portraiture in its most perfect form, still influenced by Greek idealism. In the “Casilius Inculcus” from Pompeii and in the busts of Nero and Caligula, we have the Roman realism, which never hesitated to reproduce personal peculiarities, however revolting. The realistic tendency shows itself also in reliefs—at first feebly, as in the noble sculptures from the “Ara Pacis” of Augustus; then more boldly in the Arch of Titus and the columns of Trajan and Marcus Aurelius. Hadrian’s travels in Greece and Egypt caused a momentary idealizing and archaizing reaction, shown in the noble melancholy of the Antinous busts and in the copies of old Egyptian motives. With the fall of the Antonine dynasty real creative art began to deteriorate.

The course of development in painting was similar to that of sculpture. It is impossible to say whether Gorgasos and Damophilus had any influence on contemporary painters. We indeed know from literature that temples were decorated with frescoes and that pictures of the victories of the Roman generals were borne in their triumphal processions; as, for example, of the siege of Carthage. Even the names of painters of Roman birth have been transmitted, the most celebrated being Fabius Pictor (c.300 B.C.), and the decorative painter Ludius (Ladus, Studius), a contemporary of Augustus. All were essentially Greek in technique and methods, as is evident from the few surviving works, which follow the forms of the Hellenistic period. Only mural decorations survive, but we know that panel painting was also largely practiced. The principal of these works is noticed in the appropriate place in the history of Greek painting (see PAINTING), but in many of the surviving examples there is a trend toward realism which can only be attributed to Roman influence. Such is the case with the famous “Adebrandin Marriage,” and in the delicate garden scenes, with birds and flowers, in Livia’s villa *ad Gallinas*, while Pompeian frescoes show the same tendencies under Alexandrian influence.

THE DECLINE. There is little to be said of this period. Previous tendencies continued, but the technique suffered a gradual decadence which seems almost incredible. Colored marbles, and even materials most difficult to work, such as granite and porphyry, were used for sculptures, the handiwork involved in the workmanship seeming to compensate for the crudity of the art. When Constantine built his arch, he did not hesitate to cover it with sculptures, tripped from the earlier arch of Trajan, fine specimens of Roman realistic art which stand out in strong contrast with the later reliefs, puerile in conception and execution, that were set among them. A few examples of early Christian art are con-

sponsons in this period of æsthetic decay, such as the charming "Good Shepherds" of the Lateran Museum. The same poverty of invention and decline of technique is evident in the paintings of the epoch, from which the Christian paintings of the Catacombs do not essentially differ. And with the barbarian conquest of Italy, all classical art comes to a sudden end. (See CHRISTIAN ART; BYZANTINE ART.) The Romans attained a considerable degree of excellence in certain of the minor arts, especially in objects of luxury. See JEWELRY; GEMS; RING; MANUSCRIPTS, ILLUMINATION OF.

BIBLIOGRAPHY. For a theory of Roman art in its narrower sense, see Wickhoff, *Roman Art* (London and New York, 1900). Consult also: Gentile, *Storia dell'Arte Romana* (2d ed., Milan, 1892); Goodyear, *Roman and Medieval Art* (Chautauqua series, 1897); von Sybel, *Weltgeschichte der Kunst* (Marburg, 1888); Von Falke, *Greece and Rome, Their Life and Art* (trans. by Browne, New York, 1882); Reber, *History of Ancient Art* (trans. by Clark, New York, 1882); Burn, *Roman Literature in Relation to Roman Art* (London, 1888).

The best authorities for a technical and systematic study of architecture are: Choisy, *L'art de bâtir chez les Romains* (Paris, 1873); and Durm, *Die Baukunst der Etrusker und Römer* (Darmstadt, 1885). Superb restorations of the principal buildings of Rome have been published by the architects of the *Académie de France* at Rome; that by Camina, *Ricerche sull'architettura dei tempi cristiani* (Rome, 1846), must be used with caution. Friedländer, in *Darstellung aus der Stilgeschichte Roms* (Leipzig, 1888-90), and Gûhl and Kôner, *Das Leben der Griechen und Römer* (Berlin, 1882), give good descriptions of the main classes of buildings in Roman architecture. Lanciani's works, *Ruins and Excavations of Ancient Rome* (New York, 1897), *Ancient Rome in the Light of Recent Discoveries* (ib., 1889, et seq.), are the most available in English for a history and description of ancient Rome, for which Middleton, *The Remains of Ancient Rome* (Rome, 1885), is also useful.

For pre-Roman art, consult: Dennis, *Cities and Cemeteries of Etruria* (London, 1878-83); Fontaine, *Archi ciclopici nella provincia di Roma* (Rome, 1887); Martha, *L'art étrusque* (Paris, 1889).

ROMAN CANDLE. See PYROTECHNY.

ROMAN CATHOLIC CHURCH. That portion of Christendom which is in communion with the Pope. Considering such adherence to a definite and visible centre of unity absolutely essential, it regards itself as the only legitimate Church of Christ in the world, the only inheritor by unbroken tradition of the commission and powers given by Him to His Apostles. By those outside its pale, widely differing views are taken of it, ranging from the 'Branch Theory' of High Church Anglicans (who hold that it constitutes with their own and the Eastern communions, though outwardly divided, one fundamentally interred Catholic Church), to the views of some extreme Protestants, who believe it to be an utterly corrupt organization which has, by its departures from primitive teaching and practice, almost forfeited the right to the Christian name. To the historical student, whatever his views,

the study of its doctrines and acts, so intimately connected with the story of Western civilization, must always be of great interest. Numerous articles throughout the Encyclopædia give abundant details as to the doctrine and discipline of this Church, in its relation to the historic development of Christianity. Its organization will be found treated, for example, under BISHOP; ARCHBISHOP; CARDINAL; ORDERS, HOLY. Its sacramental teaching is given under SACRAMENT; MASS; TRANSUBSTANTIATION; and in the articles on each of the sacraments. Special doctrines, such as Infallibility, Immaculate Conception, Purgatory, come under their own titles; and the biographies of numerous popes and saints will throw much light on the progressive development of the Church's history throughout the centuries.

The article PAPAcy has already traced, in as much detail as space would allow, the history of the Apostolic See of Rome down to the Council of Trent. The subsequent historical survey may best be divided into two periods. The first of these really begins before Trent, with the assembly by the Emperor Sigismund of the Council of Basel, which initiated a fresh attack on the Pope's authority, and may thus be taken to extend from 1431 to 1789, while the second reaches from the French Revolution to the present day. The first period thus embraces the break-up of the European family of nations, like-minded in religious belief, by the outburst of the Protestant revolt to counteract which the Council of Trent was assembled. It includes the extension of the faith to India, to Japan, and to the New World recently discovered, and ends with the great overthrow of the European comity of nations at the outbreak of the French Revolution. After the healing of the Great Schism (see SCHISM, WESTERN) the Church had to enter upon a contest if possible yet more momentous. She had passed out of the period of ancient and mediæval into the light of modern history, with modern appliances of printing, modern literature and art, improved connections, and fresh fields wherein to exercise her activity. Many things contributed to make the beginning of the sixteenth century a favorable time for a general assault upon her doctrine and discipline. On the one hand, the ranks of the clergy had hardly yet recovered from the distressing effects of the Black Death. Men's minds were still shaken by the seventy years' exile of the Papacy to Avignon and the succeeding schism. They were accustomed to the interference of princes with the bishops, and the curtailment of their liberty of intercourse with Rome. Lastly, all the countries of Europe were largely infected with teaching subversive of ecclesiastical authority, and were witnesses to the relaxation of discipline, neglect of the sacraments, deadness of religious life, and the luxury caused by the adoption (under the influence of the Renaissance) of heathen models among so many of the leading clergy and teachers. The details of the great revolt will be found under REFORMATION; while in the article COUNTER-REFORMATION some account will be found of the results which followed the vigorous putting into effect of the decrees of the Council of Trent. (See TRENT, COUNCIL OF.) Shortly before the time when the religious troubles in Germany caused the loss of so many members of the Catholic Church in Europe, the discoveries of the Portuguese in India and of the Spaniards in America had opened up

fruitful missionary fields from which a host of new Christians were recruited. The work of the missionaries of the first half of the sixteenth century, typically represented at its sublimest in the lives of such men as Saint Francis Xavier and Bartolomé de las Casas, breathe the true apostolic spirit. After the missions the most important work of the Church during the sixteenth century was the revival of education. This, like much of the missionary work, was due mainly to the Jesuits, who established colleges in all the countries which remained untouched by the Reformation, and also in parts of Germany. Other teaching Orders, especially of women, took their rise or were revived in spirit at the end of this century, and for the next two hundred years practically monopolized such feminine education as there was.

New elements were of necessity introduced into the political relations of the Church after the Reformation. The final loss of England, Scotland, and Scandinavia; the consolidation of the non-Catholic powers; the mercantile predominance acquired by Holland, while the power of Venice and Genoa was waning; the colonial enterprise of Protestant England, at the expense of the interests of Spain and Portugal; the growth of a mighty empire in the East under the Czars, which was ultimately to involve the destruction of the Catholic Kingdom of Poland—all these causes tended to restrict the influence of the See which had a century earlier been acknowledged as the spiritual head of all Christendom. Austria and Spain assumed the rôle of defenders of the Catholic Church. France, after the crisis of the religious wars and the submission of Henry IV., became alternately the principal support of the Catholic cause and the greatest menace to the Pope's claims of jurisdiction. A succession of sagacious pontiffs were aided in their work by a large number of saintly individuals, whose lives drew men into the Church and confirmed the wavering—Saint Ignatius, Saint Francis Borgia, Duke of Gandia, Saint Charles Borromeo, Saint Francis de Sales, and others.

During the seventeenth century the same forces were at work within the Church. The number of students in Jesuit colleges increased before 1700 to nearly 200,000. Foreign missions prospered wonderfully in China (under Father Matthew Ricci, S.J.), India, and Japan. The Reductions of Paraguay offered a shining example of the successful organization of a Christian community among recent converts from heathen barbarism.

In Europe, however, the stubborn spirit of Jansenism (q.v.) for almost a hundred years threatened the peace of the Church. Though it was ultimately suppressed, it left its mark upon the Church of France in the spirit of Gallicanism, which implies nationalism in ecclesiastical organization and discipline, as opposed to the system of unification of all Christian peoples round the one centre. (See GALICIAN CHURCH.) At the same time in Central Europe the nations who had separated themselves from this unity were daily growing in material prosperity, and during the seventeenth and eighteenth centuries the Spanish and Portuguese missions in America, Africa, and Asia were in a great measure replaced by Dutch Calvinists and English Protestants. Prussia rose to be a great Protestant

State by the side of Catholic Austria. The long minority of Louis XV. of France, under the regency of the infidel Duke of Orleans, opened the doors to the spread of a literature which, under the general name of the Encyclopædic School, treated the most vital doctrines of Christianity as open questions. The dissolute reign of that King and the immoral tone of his Court, which set the fashion for the rest of Europe, to mention a general discontent among the masses in France, when the relaxed discipline among the clergy was unable to counteract and which rapidly spread throughout the rest of the Continent. With the distinct object of eradicated Christian doctrines, the secret societies which had obtained increasing power in all the courts of Europe began by singling out for attack the Society of Jesus, in which they recognized the foremost champions of the liberties of the Holy See and of the old faith. The war, which began by the expulsion of the Jesuits from Portugal and Brazil by Pombal, was carried on by the Bourbon kings of France, Spain, and Naples, who brought such pressure to bear on Pope Clement XIV., as to force him in 1773 to decree the suppression of the Order. The removal of the most prominent exponents of religious education had a marked effect on the rising generation; and the attack on the other religious Orders, and eventually on the person of the Pope himself, could not be long delayed. The hostility to definite and dogmatic religious organizations which was shown in many quarters during the last half of the eighteenth century found expression especially in the hostile attitude of the Emperor Joseph II., and reached its culmination in the decrees of the French Revolutionary Assembly. Since then, even in nominally Catholic States, the action of European governments has generally been characterized by complete disregard of the traditional principles which had for many centuries influenced their conduct. Personal violence was offered to the Pope by Napoleon; and the nineteenth century was marked by the loss of the territory which had been subjected to Papal temporal jurisdiction, until in 1870 the last vestige of it, outside of the walls of the Vatican, disappeared.

Yet in spite of all these changes the inherent vitality of the Church has enabled it, in the concluding period, to gain in one direction what it lost in another. At the close of the eighteenth century, when Pius VI. died in captivity, those outside the Church spoke of the end of the Papacy. It was not until after the fall of Napoleon that Pius VII. was able to carry on his sacred duties in freedom. One of his acts was the restoration of the Jesuits, and, as before, they spread rapidly throughout the world, until again the principal Catholic schools came under their charge. In France the end of the first quarter of the century saw a reaction against the rationalism of the eighteenth, and, under the teachings of many zealous missionaries, the mass of the people returned to the faith of which many of them had grown up in practical ignorance.

In England the famous Oxford Movement (q.v.) called the attention of the English-speaking world to the Church's claims, and the removal of the legal disabilities under which her members had rested for three hundred years was the prelude to the restoration of an English hierarchy in 1850. Throughout the century there

was a marked and progressive change of attitude on the part of English-speaking people toward the Church—a gradual disappearance of the bitter prejudices which had been entertained, and, thanks, in the first instance, to Sir Walter Scott's novels especially, a growth of sympathetic appreciation of the mis-understood centuries before the Reformation. In Germany the Catholic revival has been very marked, and the attempt at repression by the Prussian Government in the so-called May Laws (see *KULTURKAMPF*) brought about a political union of friends of the Church which gave them, under the name of the Centre Party, the balance of power and a prominent position before the world. While governments have frequently attempted a hostile or oppressive attitude, the work of the Church has continued to grow; especially where absolute religious freedom prevails, as in the English-speaking countries, its development has been most marked. Not only in England and the United States, but in Australia, Canada, India, and South Africa, the Church is becoming one of the most prominent factors in modern life. Side by side with the gradual drifting away of most non-Catholic religious bodies from their older dogmatic strictness has come an increasing appreciation of the value of an unchanged and an unchangeable definiteness of religious belief such as is furnished by the Roman Catholic Church.

While in many indifferent or purely administrative matters she has adapted herself to the changing conditions of modern life, in regard to the great fundamental verities the Church admits no possibility of change. Pius IX., for a time dethroned and driven into exile by the revolutionary forces which swept over Europe in 1848, only six years later defined as a dogma of the faith the belief of centuries in the immaculate conception of the Blessed Virgin Mary; in 1864 he promulgated a condemnation of what were considered, from the point of view of the Church, the false doctrines held throughout European society, in a document of no uncertain sound, the *Syllabus of Errors* (see *SYLLABUS ERRORUM*); and in 1869 convoked a general council to deliberate on matters of internal discipline. Hardly had the sessions begun when all predetermined matters of discussion were set aside to consider fully and eventually to define the doctrine of Papal infallibility. (See *INFALLIBILITY: VATICAN, COUNCIL OF THE*.) This doctrine, carefully limited as it is, crystallizes in practical form the belief in a living voice which shall speak with authority on what men need to know for the general guidance of their life here and hereafter. On the burning question of the inspiration of the Bible, the Roman Catholic Church, while always declaring the Scriptures to be in a special and particular sense the word of God, yet has never committed herself to any precise theory of the manner of inspiration, and is therefore able to meet without alarm the questions raised by the so-called higher criticism. A special commission was appointed by Leo XIII. in 1903 to promote advanced biblical studies, taking into account all the material provided by modern scientific criticism.

The hierarchy of the Church, with the Pope at its head, includes as his closest advisers the College of Cardinals (q.v.), seventy in number when its ranks are full. There are eight patriarchates of the Latin rite and six of the Oriental;

these are nearly all practically titular dignities. There are 178 archbishops of the Latin rite and 19 of the Oriental. The Latin archbishops have 648 bishops in their provinces besides 84 who are immediately subject to the Holy See; and there are 52 bishops of the Oriental rite. These figures do not include over three hundred titular bishops (q.v.), who are employed as coadjutors or in missionary work. The practical administration in detail is largely carried on by the Roman congregations (q.v.), especially that of the Propaganda. (See *MISSIONS*.) It is obviously difficult to give any precise figures for the total number of adherents of this Church. The excellent authority, Mullhall, at the end of 1898, estimated the Catholic population of Europe at 148,900,000; of America at 44,100,000; of Asia and Africa at 6,600,000; and of Australia at 850,000—making a grand total of 200,450,000, or almost one-seventh of the total population of the world.

THE ROMAN CATHOLIC CHURCH IN THE UNITED STATES.

The continuous and authentic history of the Roman Catholic Church in the New World opens with the year 1494, when twelve priests accompanied Columbus on his second voyage. They were subject to the Spanish See of Seville until 1512, when the first American episcopal see of San Domingo was erected. In 1522 another see was established at Santiago in Cuba, and the See of Mexico was added in 1530. From these latter sees were evangelized the Indians of the north-eastern and south-western territories of the present United States. The traces of their work may yet be studied in Florida, New Mexico, and California, where during the period from the middle of the sixteenth to the end of the eighteenth century Spanish missionaries, chiefly Franciscans, Dominicans, and Jesuits, established numerous Christian communities, dependent, however, on the authorities in Cuba and Mexico. In the same period French missionaries evangelized the savages of the Saint Lawrence, Maine, northern New York, and the Mississippi. As early as 1634 Jesuit fathers were established in the originally Roman Catholic colony of Maryland, and after 1681 Roman Catholics were tolerated by Penn and the Quakers in their colony of Pennsylvania. From these latter centres derive the actual Roman Catholics of the United States. Until 1784 they were under the spiritual jurisdiction of the Vicar Apostolic of London, and their religious needs were ministered to by such rare missionaries as could be induced to cross the ocean.

The Revolution brought a change for the better. Religious and civil liberty, the civil disorders of Europe, the economical reverses of the Old World, the attractiveness of a new and untrammelled society, set in movement a huge immigration, of which a great percentage was Roman Catholic, mostly from Ireland. In 1790 the See of Baltimore was created, and John Carroll, a near relative of the signer of the Declaration of Independence, was made its first bishop. There were then about 30,000 Catholics in the thirteen colonies, more than one-half being in Maryland, and some 7000 in Pennsylvania. By the year 1820 the Catholics had reached the figure of a quarter of a million, and in 1840 their number was calculated at about 1,000,000. The increase of immigration trebled that number in

the next two decades, and in 1870 they were nearly 5,000,000.

The external history of Roman Catholicism in the United States during the nineteenth century is not marked by any notable events, it we except some outbreaks of intolerance. It has been the history of a voluntary religious association growing at first by accessions from without and then by its own birth rate. Its internal activity has been marked by the growth of its diocesan system and its clergy, diocesan and religious; by the building of churches and chapels, the erection of parochial schools, colleges, academies, and a university; by the provision for its own poor and destitute and helpless; by an apologetic literature of newspapers, reviews, and books. The Roman Catholic Church in the United States has had to face problems quite different from those that await her in Europe or the Orient. Her numbers are made up of many nationalities, chiefly European, that differ in racial temper and proclivities, intellectual culture, hereditary tendencies, and political past. Her chief domestic concern is the amalgamation of these various elements and the gradual formation of a homogeneous type, a task that is daily progressing to completion. In 1900 quasi-official figures placed the total Catholic population at 10,129,677. But absolutely reliable figures are not attainable, for a variety of reasons. It is probable that the number is not far from 14,000,000, if we accept the decadal ratio of growth, as established by the Catholic historian John Gilmary Shea. This population is very unevenly distributed, by far the greater part of it being found in the larger cities and industrial centres, though a rapidly increasing percentage is of native origin. From 1850 to 1900, about 4,000,000 people, nearly all Roman Catholics, emigrated from Ireland, the greater part of them to the United States. This great wave of immigration has long since fallen off; there came from Ireland in 1900 only 35,370. On the other hand, the immigration from Italy has steadily increased from 21,295 in 1886 to 100,135 in 1900, while again that from Germany has shrunk to small proportions. In about the same period, however, the immigration from Austria-Hungary, which is mainly Roman Catholic, rose from 56,199 in 1890 to 114,847 in 1900. The membership of the Roman Catholic Church is, therefore, even yet notably affected by the rise and fall of the tide of European immigration. Among the more famous leaders of Roman Catholicism in the United States we may count Archbishop John Carroll, of Baltimore, who was sent by Congress to Canada in 1776, with Benjamin Franklin, Samuel Chase, and Charles Carroll, of Carrollton, in order to induce the Canadian Catholics to join the Revolutionary forces; Bishop Chavernis, of Boston, afterwards Cardinal Archbishop of Bordeaux; Bishop England, of Charleston; Archbishop Hughes, of New York, sent by President Lincoln as an envoy to France and Spain during the Civil War; Archbishop Spalding, of Baltimore. The principal events of general interest within the last two decades are the Plenary Council of Baltimore (1884), the Catholic Congress (1889), the foundation of the Catholic University at Washington (1889), and the establishment of the Apostolic Delegation at Washington (1893).

ADMINISTRATION. The Roman Catholic Church

in the United States is part of the organic whole of Catholicism, and as such is subject to the same central legislative and executive authority as all other national churches. The Bishop of Rome, He exercises therein a jurisdiction that is recognized as of divine origin, immediate, apostolic, and ordinary. This holds good not only in matters of doctrine, but also in matters of discipline; the Pope is the final court of appeal in all matters of a spiritual or religious character. In detail, the Papal authority is partly written, partly of daily application, interpretative, executive, legislative. The basis of government is the Canon Law (q.v.), as considerably modified by the Council of Trent, and since then by the numerous decisions and interpretations of Roman congregations, as well as by Papal rescripts, and the special legislation for missionary countries and circumstances. Nevertheless, there remains much in this code of laws, in the shape of principles and spirit, which is unchanged and unchangeable, and therefore common to the Roman Catholic Church in the United States with all other parts of Catholicism.

The Church in the United States is divided into provinces and dioceses. Each province is presided over by an archbishop. Each diocesan bishop, however, is quite independent within his own territory. The archbishop presides over provincial synods, at meetings of his suffragan bishops, and exercises, in some well defined cases, a certain authority of supervision. Each diocese, moreover, is provided with a chancery and the requisite officials to carry on the canonical government of the faithful. The dioceses are divided into parishes and missions, whose pastors are appointed by the bishop. The bishop is provided with a council of priests, partly of his own selection, partly chosen by the diocesan clergy. This council, however, though it represents the cathedral chapter, has only a consultative character; its consent is not requisite to the validity of episcopal acts. It is the right and duty of the bishop to visit canonically all parishes and missions, see to the observance of the canons and other ecclesiastical legislations, and execute his own or superior judicial decisions. Where the bishop does not proceed by his own authority, as in many details that concern religious orders, he acts, since the Council of Trent, as delegate of the Holy See. Within his diocese the creation, division, and rennion of parishes; the site, style, and cost of all churches; the contracting of debts for parochial purposes; the building and conducting of schools, convents, academies; the life and works of the clergy, diocesan and religious, and of the communities of women, are subject to the bishop.

Since the third Plenary Council of Baltimore, the nomination of episcopal candidates belongs to certain of the clergy of the diocese, under the supervision of the archbishop, and eventually of the bishops of the province. The diocesan consultants and the (irremovable) rectors of parishes in the vacant diocese select three names that are ticked as 'most worthy,' 'very worthy,' and 'worthy' of the office (*admissiores*, *dignior*, *divocari*). These names are sent to the Prefect of the Propaganda after a meeting of the archbishop and his suffragans, in which said names are either approved or rejected, in whole or in part. Reason for the latter action must be submitted to the Roman authorities, with whom lies

the final choice. The delay, except in extraordinary circumstances, is usually from three to six months, during which time an administrator is appointed by the archbishop of the province.

The bishop must appoint a vicar-general, whose authority is ordinary, i. e. not dependent on restriction of the bishop, but specified in the canon law and ecclesiastical legislation. This official represents to the clergy the episcopal authority and has certain well-defined duties, rights, and attributes that go with the office and cease when he no longer holds it. Other officials, provided for partly in the canon law, partly by the legislation of national councils, hold their appointment from the bishop. Such are the clergymen to whom are assigned the official defense of marriages whose annulment is sought on canonical grounds, the prosecution of offenders against the Church laws, the examination of candidates for admission to the diocese, the visitation of parochial schools. Of the 'consultors' of the bishop, one-half are named by himself, the other half are elected by all the diocesan clergy. This council must be renominated every three years. The time and place of its meetings and the subjects of its deliberations depend on the bishop, who is not bound canonically to accept its opinions, though he is held to create it and to consult with it.

LEGISLATION. The particular legislation that emanates from the Roman Catholic episcopate of the United States as a whole arises from three sources—the national, provincial, and diocesan councils. The latter are now usually called synods, though the terms are interchangeable. There have been three national (plenary) councils—all held at Baltimore, which see, by reason of its being the first in order of time, has a quasi-primatial character accorded to it by the Holy See. These three national councils were held in 1829, 1866, and 1884. After approval by the Pope, the decisions are made public, and become the highest national ecclesiastical law and norm of administration. The effective membership of a national council is restricted to the bishops—certain ecclesiastical personages have an honorary right of assistance, but not of vote. Provincial councils are called at indefinite periods by the archbishop of each province, and the membership is confined to the suffragans of the same. The diocesan synod is called by the bishop of the diocese, and is attended by the priests of the same. It presupposes all legislation that emanates from higher sources, both general and national, and legislates for local needs.

STATISTICS. With the exception of the population figures, the statistics of the Roman Catholic Church in the United States are quite accurate. They are collected annually by the diocesan authorities, usually through the chancellor or vicar-general of the diocese, and are furnished to two directories or almanacs, Sadlier's (New York) and Hoffman's (Milwaukee); now also to the Census Bureau, which includes them in its report. In 1900 the Roman Catholic hierarchy of the United States included one cardinal, 14 archbishops, and 77 bishops. The clergy numbered 119,636, of which total 8660 were members of the different dioceses and 2976 belonged to religious Orders. There were, in all, 12,062 places of public worship. Of these 6409 are classed as parish churches, 3930 as missionary churches, and 1723 as chapels. The reason of the distinc-

tion lies partly in the fact that all the parish churches have resident priests, partly in the frequency of use, size, and accessibility of the mission churches and chapels. The education of the clergy was provided for in 30 diocesan seminaries, with 2630 students. The religious Orders had 79 novitiates with 1998 students or candidates. The educational institutes were one pontifical university (Washington), 170 colleges for boys, and 662 academies and convents for girls. There were 3811 parochial schools, with an attendance of 854,523. The charitable institutions were 827 in number, exclusive of 251 orphan asylums that sheltered 35,243 children of both sexes. The Catholic population was estimated at the low figure of 10,129,677. The Catholic Indians numbered about 90,000; 113 priests worked among them, and served 183 churches or chapels. There were 73 Catholic schools, with 24 teaching sisterhoods and 5000 pupils of both sexes. The colored Catholic population was estimated at about 140,000. There labored among them 48 white priests, with the charge of 40 churches. The colored Catholic schools were 81 in number, cared for by 24 sisterhoods, with an attendance of 6401 children of both sexes.

BIBLIOGRAPHY. For the general history of the Church, consult the works of Alzog, Darras, Hergenröther, Rohrbacher, and Brueck; also the biographies of the popes and saints generally. For England, consult: Gillow, *Bibliographical Dictionary of English Catholics*, since the Reformation (London, 1885 et seq.); Brady, *Annals of the Catholic Hierarchy in England, 1585-1876* (ib., 1877); Amherst, *History of Catholic Emancipation, 1771-1821* (ib., 1886); *The Position of the Catholic Church in England and Wales During the Last Two Centuries* (New York, 1892); Fitzgerald, *Fifty Years of Catholic Life and Progress* (London, 1900). The legislation of the three national councils is accessible in *Concilia Plenaria Baltimorensia* (3 vols., Baltimore, 1867-86). For a liberal foreign appreciation of the general position of the Church in the United States, consult Vicomte de Meaux, *L'Eglise catholique et la liberté aux Etats-Unis* (Paris, 1893).

ROMAN CATHOLIC EMANCIPATION.

After the Reformation, both in England and in Scotland, Roman Catholics were subjected to many penal regulations and restrictions. As late as 1780 the law of England made it felony in a foreign Roman Catholic priest and high treason in one who was a native of the kingdom to teach the doctrines or perform divine service according

to the rites of his Church. Roman Catholics were debarred from acquiring land by purchase. Persons educated abroad in the Roman Catholic faith were declared incapable of succeeding to real property, and their estates were forfeited to the next Protestant heir. A son or other nearest relative, being a Protestant, was empowered to take possession of the estate of his Roman Catholic father or other kinsman during his life. A Roman Catholic was disqualified from undertaking the guardianship even of Roman Catholic children. Roman Catholics were excluded from the legal profession, and it was presumed that a Protestant lawyer who married a Roman Catholic had adopted the faith of his wife. It was a capital offense for a Roman Catholic priest to celebrate a marriage between a Protestant and a Roman Catholic. In 1780 Sir George Saville introduced a bill for the repeal of some of the most severe disqualifications in the case of such Roman Catholics as would submit to a proposed test, which included an oath of allegiance to the sovereign, and abjuration of the Pretender, a declaration of disbelief in the several doctrines—that it is lawful to put individuals to death on pretense of their being heretics; that no faith is to be kept with heretics; that princes excommunicated may be deposed or put to death; and that the Pope is entitled to any temporal jurisdiction within the realm. The bill, from the operation of which Scotland was exempted, eventually passed into law. In 1791 a bill was passed affording further relief to such Roman Catholics as would sign a protest against the temporal power of the Pope and his authority to release from civil obligations; and in the following year the most severely penal of the restrictions bearing on the Scottish Roman Catholics were removed without opposition.

Endeavors were made at the same time by the Irish Parliament to place Ireland on an equality in point of religious freedom with England. The agitation culminated in the Irish Rebellion of 1798; the union of 1801 followed, which was partly carried by means of pledges, not redeemed, regarding the removal of the disabilities in question. Meantime in England Roman Catholics continued subject to many minor disabilities, which the above-mentioned acts failed to remove. In the early part of the nineteenth century many measures were proposed for the removal of these disqualifications, and the agitation on the subject among the Roman Catholics themselves greatly increased, in 1824 assuming an organized shape by the formation of the 'Roman Catholic Association' in Ireland. The Duke of Wellington, who for a long time felt great repugnance to admit the Roman Catholic claims, was at last brought to the conviction that the security of the Empire would be imperiled by further resisting them, and in 1829 a measure was introduced by the Duke's Ministry for Catholic emancipation. The celebrated Roman Catholic Relief Bill was passed the same year. By this act an oath is substituted for the oaths of allegiance, supremacy, and abjuration, on taking which Roman Catholics may sit or vote in either House of Parliament, and be admitted to most other offices from which they were before excluded. They, however, continue to be excluded from the offices of guardian and justice or regent of the United Kingdom, Lord Chancellor, Lord Keeper, or Lord Commissioner of the Great Seal of Great Britain

or Ireland, and Lord High Commissioner to the General Assembly of the Church of Scotland.

ROMANCE (OF), *romans, romanis, romanus, romanica, romanica, romanica*, from *ML. Romanus*, in Roman or Latin fashion, from *Lat. Romanus*, from *Romanus*, Roman, from *Roma, Romæ*. Originally, anything written in one of the Romance languages; in the fifteenth and sixteenth centuries, a story in prose dealing with the adventures of knights. From the French, which had taken it from the Spanish, the word romance came into English. The essentials of romance are a passion for the adventurous, the strange, and the marvellous, and a tendency to exaggerate the virtues and vices of human nature. European romance, in the larger application of the term, dates from the Greeks. It was a development from the epic. The *Æneid*, representing men and incidents as they were believed to be at the time of its composition, is an epic with only a few romantic episodes. But the *Odyssey*, depicting an imaginary voyage employed as the framework for a series of marvellous folk-tales, is essentially a romance. This love of romance, so manifest among the earlier Greeks, reached its climax in the first centuries of the Christian era. In the article *NOVEL* is given a brief account of the fictions then current, in which the sophists tried to outdo one another in imagining adventures that could not possibly happen in real life. But the same age produced the beautiful *Cupid and Psyche* of Apuleius (who, though he wrote in Latin, was Greek in spirit), and the *Hero and Leander* of Musæus, which has charmed a succession of English poets from Marlowe to Byron. The Greek stories began to find their way into Western Europe as early as the twelfth century. Indeed, *Apollonius of Tyre* was translated into Anglo-Saxon from a Latin epitome of the original Greek; and after various renderings, it was turned into a drama by Shakespeare in his *Pericles, Prince of Tyre*. One Greek motive, that of the hero or heroine in disguise to be followed by a beautiful recognition scene, became a favorite with the romancers of Western Europe, from whom it passed into the choicest comedies of Shakespeare. Other familiar motives of modern romance, as 'the exile and return,' 'the assumed death,' and 'the test of chastity,' seem also to have been derived from the Greeks.

The mediæval verse romance was an offshoot of those epic narratives called *chansons de geste*, celebrating the victories of Charlemagne and other great leaders, usually over the Saracens. When the incidents which first gave occasion to the epic recital receded into the distant past, marvel was added to marvel. And when in the twelfth century the French trouvères assigned love as the prime motive for the adventures of the knight, the epic was transformed into the romance. From their original home in France, the romances were diffused over Western and Northern Europe. Made for men and women of rank, often for the Court, they were not recited, as were the earlier *chansons de geste*, by minstrels; they were rather designed to be read aloud in groups of lords and ladies, or, like the modern novel, to be read in private. The mediæval romances gathered in cycles round great events and heroic heroes, as the siege of Troy, Charlemagne, and King Arthur. The Troy legend, derived from Latin sources, was treated in Fran-
 ce

by Benoît de Sainte-More in his *Roman de Troie* (late twelfth century), from which the great story of Troilus and Cressida (Cressida) was afterwards taken up by Boccaccio in Italy and by Chaucer in England, receiving dramatic form from Shakespeare. The legend of Charlemagne, telling of the destruction of the Emperor's rear guard by the Saracens in the passes of the Pyrenees, is extant in two principal forms: the *Chanson de Roland* (close of eleventh century) and the Latin romance of the pseudo-Turpin (about 1125). Later romancing on Charlemagne led to the legends known in their English dress as *The Soudan of Babylon*; *Otuel*; *Sir Firumbras*; and the prose *Huon of Bordeaux*, which first make known to England Oberon, the King of the fairies in Shakespeare's *A Midsummer Night's Dream*. Beautiful as many others may be, the mediæval romances that appeal most strongly to the English race are those celebrating the deeds of King Arthur and the knights of the round table, on which the French and Anglo-Norman poets built up a vast romantic structure in harmony with the ideals of chivalry. Reduced to prose, Arthurian romance was handed over to later times by Sir Thomas Malory in his *Morte d'Arthur* (1485). These cycles which have been described are only sections of an immense body of romance current in the Middle Ages. Other heroes were Alexander, King Richard Lion-Heart, King Horn, Havelok the Dane, Guy of Warwick, and Sir Bevis of Hamtoun.

The later romances in prose are more definitely connected with the history of the novel, under which head they are noticed. We may cite *Amadis de Gaula*, the flower of Spanish romance, Sir Philip Sidney's *Arcadia*, the historical romances of Sir Walter Scott, and the revival of adventure in Robert Louis Stevenson and his numerous followers. The legends of King Arthur have been adapted to the nineteenth century by Tennyson, Swinburne, and others; and a group of tales, Greek and mediæval, have been delightfully retold by William Morris in *The Earthly Paradise*.

See the articles on the Grail and on the romantic heroes; Arthur, Gawain, Guinevere, Guy of Warwick, Lancelot, Merlin, Percival, and Tristram. For the relation of romance to the novel, see NOVEL. The revival of romance is discussed under the head ROMANTICISM. Consult also: Saintsbury, *The Flourishing of Romance* (London, 1897); Ker, *Epic and Romance* (ib., 1897); Billings, *A Guide to the Middle English Romances* (New York, 1901); Körting, *Grundriss der Geschichte der englischen Litteratur* (Münster, 1899); and Gaston Paris, *La littérature française au moyen-âge* (Paris, 1890).

ROMANCE. In music, a vocal composition in epic-lyrical style resembling in form the ballad. But while in the ballad Nature, or some natural power personified, constitutes the theme, the romance draws its subjects from stories of knightly adventure. In recent times the term romance has also been applied to purely instrumental compositions of a romantic character the form of which is as elastic and indefinite as that of the instrumental ballad. The term originally meant nothing more than a narrative in Romance (Provençal) verse as distinguished from Latin verse (twelfth and thirteenth centuries). In

France a romance is merely a sentimental love-song.

ROMANCE LANGUAGES. The languages sprung from Latin and bearing its impress strongly in vocabulary and grammar. In a rough way, the Romance territory in Europe corresponds to what belonged to the ancient Roman Empire. It is bounded approximately by the English Channel, the Atlantic Ocean, the Mediterranean Sea, the Adriatic, and a line drawn through Belgium from Gravelines to Eupen, and then from Eupen to the Alps and the Adriatic. In the East, isolated from the rest, is Rumania. Colonists have also carried these forms of speech to other continents, and they are spoken in Canada, Mexico, Central and South America, and in various settlements in Africa and Asia. It is usual to speak of seven or eight Romance languages, though the division is more a matter of convenience than of scientific accuracy. These are Rumanian, Romansh (Rhetian, Latin), Italian, French, Provençal, Spanish, and Portuguese, to which is added, according to the views of the individual scholar, Catalan or Franco-Provençal or Sardinian.

Though contemporary references show the existence of the *lingua romana* in the seventh century, nothing was at that time written in this form of speech. Every one who could write at all wrote, or attempted to write, in Latin. The earliest known monument in any Romance language is the Strassburg Oath, sworn in A.D. 842 by the armies of Louis the German and Charles the Bald, and preserved in the Latin history of Nithard. These oaths consist of a little more than 100 words in French. To the end of the ninth century belongs the *Sainte Eulalie*, a short poem, also in French. There are a few other documents belonging to the tenth century, but extended literary works are not found before the eleventh. To this same time belong the earliest writings in Provençal, while, with the exception of a few formulas, there is nothing in Spanish earlier than the twelfth, nor in Italian earlier than the thirteenth century.

Between the classical Latin, therefore, and the earliest written specimens of the Romance languages, there is a great gap, which philologists attempt to bridge as well as they may by reconstructing the forms of popular or late spoken Latin. The materials available for this task are inscriptions, dialogue in the old comedies, errors reprehended by Roman grammarians, specimens of early mediæval Latin, documents written by ignorant scribes, and, above all, the features of the Romance tongues themselves. However wide the gap which exists between the written documents in the two forms of speech, there is nevertheless not the least break in the continuity of the development from spoken Latin to the various modern Romance languages.

The Romanization of the West, so thoroughly accomplished, went on actively for about four centuries, though it is quite impossible to fix accurate dates for a process of this kind. Beginning in Italy itself with the subjection of non-Latin neighbors, it spread to Sicily in the third century B.C., a century later to the Mediterranean coast of Gaul and Spain, and to Gaul proper only after the beginning of the Christian Era. During this period the Latin language itself naturally underwent changes, and

the later colonists carried with them a speech differing somewhat from that of their forefathers. It must not be supposed, however, that this spoken language was precisely the same as that written by the masters of classic literature. Each grade of society, each part of the country, must have had its own linguistic peculiarities. Yet there seems to have been throughout the Roman dominions a remarkable uniformity both of grammatical forms and of vocabulary, political unity tending to break down dialect variation. On the other hand, the pronunciation doubtless varied largely, according to the native races who learned the tongue of their conquerors, much as English differs in the mouths of the various inhabitants of the British dominions in Asia, Africa, and America.

Throughout the vast Roman Empire, then, besides the Latin of written books and formal speech, unchangeably fixed for later generations in the classic masterpieces, there existed a more careless diction of every-day life, used by the uncultured. It is frequently referred to as *sermo cottidianus, proletarius, rusticus, vulgaris, or militaris*. Although much uncertainty prevails in regard to the relations between this language of the vulgar and that of literature, we may be sure that it was subject to comparatively rapid phonetic and grammatical change and that its vocabulary admitted words upon which the purist frowned. In the course of time the quantity and quality of the vowels were altered. Short vowels became open, while long ones were closed. Then short vowels in free syllables were lengthened, long checked vowels shortened. Certain unstressed vowels disappeared and some final consonants, notably *m*, were dropped. Voiceless consonants between vowels became voiced, and then were lost, while in other positions different consonants underwent a variety of transformations. From the conjugation of verbs the future and the passive are lost. The cases of nouns fall together, and relations are largely expressed by prepositions. Vulgar words are often preferred to the more refined, as *caballus*, 'hag,' instead of *equus*, 'horse;' strong words to the more usual, as *manducare*, 'to chew, to devour,' instead of *edere*, 'to eat;' sometimes new forms merely replace the old, as *amicitas* for *amicitia*.

This vulgar or popular Latin was, as has been said, comparatively uniform throughout the Roman Empire, though some differences must be assumed, due partly to the different epochs at which the provinces were Romanized and partly to the character of the races inhabiting those provinces. Yet, on the whole, the indigenous tongues seem to have left upon the development of the *lingua romana* but faint traces of their influence. They doubtless had their effect in modifying pronunciation, though there is but little certain knowledge on this subject, and they also contributed a few words to the vocabulary. It is remarkable, however, how little can be traced even to so important a race as the Celts. In all the most significant linguistic elements, the Romance languages are nothing but Latin following a normal evolution in an unbroken tradition.

The Teutonic invasions, though they destroyed the unity of the Roman Empire, did not, in those countries in which Latin was firmly established, interrupt its linguistic development. By isolating the different communities, however, and

through the substitution of a number of independent States in place of a centralized government, consulting of free intercourse with Rome, the Gauls gave an impetus to the separation of the various dialects. Moreover, they had some influence upon the pronunciation and contributed considerably to the vocabulary, particularly words connected with war. Even before the barbarian conquest a number of such terms had been in use among the Romans, owing probably to the presence of German troops in the Imperial armies, but the later additions are much more important and copious. In fact, no other external influence upon the Romance languages can compare in weight and value with that of the German.

The loss of the sentiment of nationality led, in the sixth and seventh centuries, to the rise of the Romance nations and of the Romance languages. It was recognized that those speaking the *lingua romana* could not understand Latin, nor could one using Latin understand the various forms of the *lingua romana*. Moreover, French was seen to be different from Provençal, and Provençal from Italian and Spanish. In each country, indeed, a literature was developed in the vulgar tongue. At first every author wrote in his native dialect, but soon political and literary centres began to exercise a powerful influence, and the dialect of Paris or Florence or Castile came to be the official and correct language, while the other dialects sank more and more into the mere patois of the uneducated peasant.

During all this development the literary Latin, the language of the Church and of learning, more or less rigidly written according to unchanging rules and models, never ceased to affect the popular tongue. Borrowing went on without interruption, giving rise to learned terms which often exist side by side with popular terms developed from the same Latin word. These learned terms can be distinguished by their closer resemblance to the original, since they have not passed through the natural phonetic development. We have, for example, from the Latin *causam*, in French the doublets *chose* and *cause*, and in Italian *casa* and *causa*. In borrowing from other sources than Latin, German has given most to French, and Arabic to Spanish, but every modern language contributes to the vocabulary of its neighbors.

The evolution of the Latin into the Romance languages can best be studied in the concrete case of one particular tongue such as French, Italian, or Spanish, but a few general remarks, by no means exhaustive, may be made. The Latin accent or stress usually remains on the syllable on which it was originally. Changes in the vowels are conditioned by the stress, by the fact of their being free or checked, by the influence of preceding and following sounds, both vowel and consonant, and by position, either initial or final, before or after accent. The changes in consonants are conditioned chiefly by their position, initial, intervocalic, or final, and by their combination with other consonants. In the Romance tongues the inflection of substantives has almost wholly disappeared, and there is but one case, usually derived from the Latin accusative; the plural at least in the written form, is distinguished from the singular; the neuter gender is longer exists. The personal pronouns have three or four cases, and both stressed and unstressed

forms. The definite article has been developed out of the Latin *ille* and the indefinite article out of *unus*. The verbs commonly make a new future with *habeo* and the infinitive, as *cantare* + *habeo*, giving Italian *cantarerò*, Spanish *cantaré*, French *chanterai*, 'I have to sing, I shall sing.' The new passive is made by joining a past participle to some form of *esse*, 'to be,' or the active voice of the verb with a reflexive pronoun. New perfect tenses have also been made with the perfect participle preceded by *habeo* or *sunt*. A considerable array of suffixes has been developed with which new words can be built from various material.

ROMANCE LITERATURES. The literatures of the various Romance languages, especially French, Provençal, Italian, Spanish, Portuguese, and Rumanian. See ROMANCE LANGUAGES; FRENCH LITERATURE; ITALIAN LITERATURE; PORTUGUESE LITERATURE; PROVENÇAL LITERATURE; RUMANIAN LANGUAGE AND LITERATURE; SPANISH LITERATURE.

ROMAN DE LA ROSE, rô'mân' de là rôz (Fr., Romance of the Rose). A famous French poetico-satirical allegory of the thirteenth century. The work, which is in octosyllabic verse, and which is over 23,000 lines long, consists of two distinct parts, the first of which, in 4670 verses, was composed by Guillaume de Lorris (q.v.) about 1230. It is related as a 'dream,' and celebrates the trials and triumphs of love. The author, called Loving (Amant), in early spring enters a beautiful garden where there is a rose-bud which he feels impelled to pick. The god of love, who has followed him thither, pierces him with three arrows, each of which increases his desire. After various adventures, he obtains from Welcome (*Belaccueil*) the permission to kiss the rose, but Jealousy comes up, surrounds the rose with a wall, and locks up Welcome in a tower. Loving, deprived of the sight of the rose, is overcome with sorrow. Though commonplace in itself, this story is embellished by a great number of poetic details and by the most graceful and vivid descriptions. The style, too, is picturesque and refined. For some unknown reason (some say the death of Guillaume), the poem was interrupted here, and only after forty years was taken up and completed in almost 20,000 verses by Jean de Meung (q.v.). The latter, of a very original and radical turn

of mind, has been called the Voltaire of his age. He conceived the singular notion of supplanting Guillaume's *ars amatoria* by an elaborate treatise on the scientific and political questions of his age. Loving is accosted by Reason who in a long argument endeavors to make him leave the service of Love. But at this point Friendship steps in and urges him to besiege the tower. Love also promises his aid and assembles all his forces. The action is here retarded by a long interview of Nature with her chaplain Genius. Finally the tower falls and Welcome, set free, allows Loving to pick the rose.

The main interest of the second part lies, of course, in the expression of the author's individuality. This reveals an amount of learning and perspicacity unusual for that time. Jean denies the divine right of kings and proclaims the sovereignty of the people. He condemns the celibacy of the clergy as immoral because unnatural; he expresses his disbelief in ghosts and sorcerers, and in the influence of comets over human lives. His work is also notable from a literary point of view; though prolix and often trifling, it abounds in vigorous descriptions, realistic portraiture, and eloquent invective.

The immediate influence of the *Roman de la Rose* surpassed that of any other mediæval work. It is extant in more than 200 manuscripts, and a later remodeling by Marot was almost more popular than the original. It gave the impulse to the rise of allegory in other countries. Translations into foreign tongues appeared toward the end of the thirteenth century. Henry von Ahern put it into Flemish, Durante—a contemporary of Dante—into Italian sonnets, and Chaucer into English verse. Unhappily for English literature, Chaucer's translation is lost.

ROMAN DE LA VIOLETTE, de là vô'ô'lét' (Fr., Romance of the Violet). A French poem of the thirteenth century in about 6700 rhymed eight-syllabled verses, by Gerbert de Montreuil. It tells of a woman whose virtue is the subject of a wager. She is slandered, but succeeds at last in proving her innocence. This Greek tale is the basis of the *Roman du Comte de Poitiers*, of *Floire et Jeanne*, the miracle of *Ot et Bérançier*, of the ninth story of the second day in the *Decamerom*, and of Shakespeare's *Cymbeline*. Weber's opera *Eurianthe* (1823) has the same story for its dramatic theme. The *Roman de la Violette* was published by F. Michel (Paris, 1834). Consult the *Histoire littéraire de la France*, vol. xviii. (ib., 1835).

ROMAN EMPIRE, HOLY. See HOLY ROMAN EMPIRE.

ROMANES, rô-mâ'nés, GEORGE JOHN (1848-94). An English biologist and psychologist, born

at Kingston, Canada. He was educated in England, France, Germany, and Italy, graduating from Gonville and Caius College, Cambridge, in 1870, with honors in natural science. In 1875 and again in 1881 he was Croonian lecturer to the Royal Society, to which he was elected to membership in 1879. Later he became Fullerian professor of physiology in the Royal Institution of London and Rosebery lecturer on natural history in the University of Edinburgh. He also served the Linnean Society as its zoological secretary. Besides publishing a series of monographs on the Medusa, Echinoderms, etc., he devoted himself to extending the principles of evolution in the field of psychology, having become an intimate friend of Charles Darwin while in Cambridge. His chief works are: *A Candid Examination of Theism* (1878); *Animal Intelligence* ("International Scientific Series," xlv., 1881); *Charles Darwin: His Life and Character* (1882); *The Scientific Evidence of Organic Evolution* (1882); *Mental Evolution in Animals, with a Posthumous Essay on Instinct by Charles Darwin* (1883); *Jelly-fish, Star-fish, and Sea Urchins* ("International Scientific Series," xlix., 1885); *Mental Evolution in Man: Origin of Human Faculty* (1888); *Darwin and After Darwin: An Exposition of the Darwinian Theory and a Discussion of Post-Darwinian Questions* (1892-97); *An Examination of Weismannism* (1893); *Thoughts on Religion* (1895); *Mind and Motion and Monism* (1896). Consult *The Life and Letters of George John Romanes, written and Edited by His Wife* (London, 1898).

ROMANESQUE ART (Fr. *romanesque*, from Sp. *romanesco*, from ML. *Romaniscus*, Roman, from Lat. *Romanus*, Roman, from *Roma*, Rome). A general name for the art that flourished in Europe during the period of fermentation before the definite constitution of nationalities, from about A.D. 800 to 1200. In general it is remarkable only for its architecture, which overshadows all other branches. Sculpture and painting revive, but are still in their infancy; goldsmith work, illumination, and ivory-carving are practiced with better success. Except in Italy, the art of this period is chiefly monastic. The great free cities in Italy and the Imperial and feudal houses of Germany were the only great stimuli to art production besides the monasteries themselves. The first two centuries of this age were dormant and preparatory, the last two alone were productive.

ARCHITECTURE. The architecture of this period is called by the names of various schools, which are merely topographical variations of the general style, e.g. the Lombard (q.v.) in Northern Italy, the Rhenish in Germany, the Saxon and Norman (q.v.) in England, the Provençal and Norman in France. The works of each may be divided into two groups according as its buildings were unvaulted or vaulted. The unvaulted type was the earlier, and in some sections continued until the end; the vaulted type was an innovation after A.D. 1000, and gradually spread over many of the most progressive regions and prepared the way for the ideal vaulted style—the Gothic. Up to A.D. 1000 the style in some regions was practically a continuation of early Christian art, as in the basilican churches of Rome, but certain new elements were introduced in the north, among which the chief were the

development of the cruciform plan with elongated choir; double choirs, often raised; double transept; substitution of piers for columns or alternation of the two crypts; and bell towers as part of the plan.

These innovations affected the scheme and composition rather than the style of construction or ornamentation. An Eastern influence is seen in a number of circular or polygonal domed churches, among which the Cathedral of Châlons-Magne at Aix-la-Chapelle is the masterpiece. The systematic and elaborate planning of the buildings of a great monastic establishment belongs to this period, as is shown at Saint Gall (q.v.). The church at Michelstadt is an example of the oblong plan. Saint Michael at Hildesheim (1003-13) brings us to the threshold of the next stage, when vaulting began to be substituted for wooden ceilings. Thus far there had been no development of sculptural ornament or moldings; the style was perfectly plain. In Italy, from which the earlier builders in the north of Europe had originally come, the changes were hardly felt at all, and examples of timber-roofed churches scattered from one end of Italy to the other show the continued prevalence until long after A.D. 1000 of the plain basilical plan without transept or choir, but with occasional use of the crypt (q.v.), a feature developed in the monastic churches of the north.

The renovated civilization of the eleventh century created an architecture worthy of standing by the side of the new scholastic theology, of the revived faith that led to the Crusades, and of the reconstituted organisms of Church and State. It was natural that the free republics of Italy should lead in the field; their rivals were the Rhenish and Saxon cities of the new German Empire and the Romance cities of Provence and the rest of Southern France. The eleventh and twelfth centuries were marked by extraordinary creative activity in the development of new types of monastic buildings (see MONASTERY) and churches, but also in the creation of entirely new classes of buildings, such as feudal castles (q.v.), and artistic city houses. The monastic artists were soon rivaled by the lay guilds. The impression made by a study of Romanesque monuments throughout Europe is of unequalled variety, inventiveness, and boldness in seeking unconventional solution of architectural problems. In the absence of organized national life, each province developed its special style. Certain general characteristics are, however, evident. The introduction of vaulting led to the general use of heavy walls in place of the thin walls that had sufficed for wooden roofs. Doors and windows had to be splayed and decorated with moldings, carving, and sculptures, which became increasingly rich and varied. The proportions were entirely changed by the use of the vault; the nave was necessarily narrower and was raised higher in order to give room for windows under the base line of the vault. Heavy piers replaced columns and were membered with engaged shafts corresponding to the vaulting ribs and pier arches.

This, beginning about A.D. 1000 with plain square piers and plain openings, with very heavy walls (as at Vignory in France with its wooden roof), we proceed through progressive stages until in the twelfth century we get to the richness of Saint Servin at Toulouse and the Abbey of

Vezelay or of Peterborough, Ely, and Durham. Only in a few provinces where early Christian and classic traditions were strong, as in Rome and Tuscany, did the old columnar basilica maintain its sway. Æsthetically the Romanesque style impresses by its seriousness of purpose, its massiveness, and its originality. The substitution of vaulting in place of the combustible wooden roof introduced an entirely new structural problem, and the Romanesque attempts at its solution were endlessly varied: domes, round and pointed tunnel vaults, unribbed and ribbed groin-vaults of every conceivable form were used. The architects were seeking for a perfect equilibrium of parts. This was not discovered until the Gothic ribbed vault and flying buttress were evolved in the latter part of the twelfth century.

ITALY. In Italy especially, the diversity of styles during the Romanesque period is extreme. Venice, for example, is predominantly Byzantine, not only in Saint Mark's with its domes and mosaics, and in the churches of Torcello (Cathedral and Santa Fosca) and Murano, but in its private palaces with their stilted arcades, marble façades, and sculptured ornament. Then again, the cosmopolitan culture of the Norman kings of Sicily produced a gorgeous architecture made up of Latin, Greek, and Arabic elements, as in the cathedrals of Cefalù and Monreale, and the Cappella Palatina at Palermo. In Calabria there appears a pure Byzantine style, with tiny domical churches, like those of Greece; in Campania, especially at Ravello and Salerno, Moorish and Byzantine influences sometimes predominate, though we often find a strong Lombard element. Working northward, we now find two main divisions, based on different principles: the classic and the Lombard. The classic school is represented by the Roman provinces and Tuscany, which produced works of great beauty of form and color, but covered with the wooden roof. This school is best represented by the mediæval basilicas of Rome itself, and by the cathedrals of Terracina and Cività Castellana. Its simple but majestic columnar interiors with rich mosaic ornament, its symmetrical brick campanili and exquisite architraved porches recall the best early Christian art. Less classic, but even more monumental and gayer in their exteriors, were the Tuscan churches. Here Pisa—Venice's great rival at this time—takes the lead with its cathedral, baptistery, leaning tower, and a host of other buildings, followed by Lucca, with San Frediano, San Giovanni, and San Michele as well as Pistoia, Prato, and other smaller towns. The same use of columns and roof as in Rome is combined with an alternation of black and white marbles borrowed from the East and with interior and exterior open arcades and galleries borrowed from Lombardy, as was also the use of relief sculpture on the façades.

The Tuscan churches, like the Roman and the Lombard, had a single detached bell-tower or campanile, usually to the right of the church. In this Italy differed both from the Orient and from Northern Europe, where the bell-tower or a pair of them was ordinarily an integral part of the church. The Lombard style, the second of the two great schools named above, made frequent use of the groined vault, and secured a sombre impressiveness by the heavy proportions and details that went with vaulting. Externally

the same impression results from the use of plain walls of brick or stone unrelieved by marble. Sant' Ambrogio at Milan and San Michele at Pavia were the earliest examples and furnished the type; the cathedrals and baptisteries of Parma, Cremona, Piacenza, Ferrara, and Modena are all superb structures, unsurpassed by buildings of any age in Italy. In this province the baptisteries are especially numerous and important (e.g. Parma and Cremona). Here also were built the earliest town-halls of the free communes. Hardly less monumental, but with less consistent use of vaulting, are the South Lombard churches of Apulia, where the decoration is richer and more artistic than in Lombardy itself, as at Bitonto, Altamura, and Troja. The portals and wheel windows are the richest and most symmetrical in Italy. Apulia is also rich in churches showing French, Norman, and Byzantine influences. Baptisteries and towers were very few in this province, so that the churches usually stand alone.

FRANCE. It was in France that the Romanesque style, forsaking early Christian and classic traditions, and unaffected by contemporary Oriental art, first developed as an independent style merging into the Gothic. With greater homogeneity than in Italy, it nevertheless displays well-marked local variations or schools, e.g. those of Provence, Auvergne, and Périgord in the south, of Burgundy in the centre, and of the Royal Domain and Normandy in the north. It was in these schools that the successful struggle to create a vaulted style as a substitute for a wooden-roofed style was carried on, leading ultimately to the Gothic-ribbed vault and buttress. The Byzantine domical solution with a single nave was adopted in Aquitaine, especially in Périgord, where Saint Front at Périgueux, with its five domes over a Greek cross, is comparable to Saint Mark's at Venice and the Cathedral of Cahors shows how a single long nave may be covered with a row of domes. This style, at first very plain, became enriched with typical Romanesque detail and ornament through the twelfth century, and is then represented by such masterpieces as the cathedrals of Angoulême and Fontevault. The other most fruitful early school was that of Auvergne, in which occur the earliest examples of the long choir with side aisles, ambulatory and radiating chapels, later elaborated in the Gothic style. Its masterpiece is the largest remaining Romanesque church in France—Saint Servin at Toulouse, with its imposing central tower, tunnel-vaulted nave, symmetrical composition, and rich details. Tunnel-vaulting and classic traditions are conspicuous in the southernmost or Provençal school. Saint Trophime at Arles and Saint Gilles are celebrated for their richly sculptured portals. Ordinarily the churches were of moderate size, often with but a single nave, as at Avignon, Cavaillon, and Montmajour. Still commoner, however, was the three-aisled type with the side aisle so disposed as to receive the thrust of the central tunnel vault. The difficulty of providing a clear-story, with this arrangement, led to varied expedients to avoid the resulting dark interiors, and stimulated ingenuity in vault-building, by which ultimately clear-story windows were introduced. This school is inferior to that of Auvergne especially in the absence of the triforium to break up the wall surfaces.

It was in Burgundy, however, that the tunnel-vaulted, three-aisled basilica was most highly developed by the monastic orders of Cluny and Cîteaux; and the spread of these orders popularized throughout Europe the building methods current in Burgundy. The primitive form of this style is given in the great Church of Saint Philibert at Tournus, remarkable for its unique series of tunnel-vaults, built transversely over the nave. Of equal importance was Saint Benoît-sur-Loire, another monastic church of impressive simplicity and size, and finally the most colossal church of mediæval Christianity, the Abbey at Cluny (long since demolished), on which all the wealth of perfected Romanesque style was lavished, and whose influence extended over the whole province. The abbey Church of Vézelay is the most perfect remaining example of this influence. Autun is a masterpiece of another sort showing classic traits. Omitting some secondary schools of Middle France, there remain three principal northern schools, Champagne, Ile-de-France, and Normandy. These differed from the more southern schools in their long retention of the wooden roof to cover even their largest structures. The two great churches at Caen, the Abbaye aux Hommes and Abbaye aux Dames, which were the precursors of the early Gothic cathedrals, were at first wooden-roofed (c.1150), their groined vaults being of later date. The Norman scheme of facade, with its two high flanking towers, and the Norman system of groined vaulting, was adopted in the Ile-de-France (as at Saint Denis) and then passed into the early Gothic architecture. To recapitulate, there is in the French Romanesque a remarkable variety of methods and of vaulting, of plan, of lighting, and of external and internal decoration. The monasteries and their churches were then of far greater importance than the cathedrals, and therefore such accessory buildings as cloisters (q.v.) and chapter-houses (q.v.) form important classes. Porches (q.v.) and towers (q.v.) on the church façades were also of varied design.

GERMANY. To the political leadership of the German emperors of the tenth and eleventh centuries—the Otthos and Henrys—corresponds an earlier and larger architectural activity than elsewhere in Europe. The great cathedrals of Worms, Mainz, Speyer, and Bonn show how the bishops surpassed the monasteries at a time when in France the monasteries were supreme and the cathedrals insignificant. At the same time, the wealth of monastic buildings was increased in the twelfth century by the advent of the Cistercian monks, who were great builders. The three earliest schools were the Rhenish, the Saxon, and the Bavarian-Swabian; while there were secondary off-shoots in Westphalia, Hesse, the Main region, and in Alsace. While buildings were planned on a large scale, there was no attempt at solving the vaulting problem. Not a church was vaulted during the eleventh century, and during the twelfth few outside of the Rhenish school. The great Rhenish cathedrals as they now stand were mostly planned for wooden roofs and vaulted at a later date. First Speyer (c.1100), then Mainz (c.1125) were covered with square groin-vaults, the only kind that became popular in Germany, and these were followed by the great Abbey of Laach, with its oblong groin-vaults. There is, therefore, less difference between the early Christian basilicas and the Ro-

manesque cathedrals in Germany than in France. Some of the earliest examples are at Germolde, Quedlinburg, Reichenau, Regensburg (Saint Emmerich), Hildesheim, Saint Michael, Cologne, and the largest number of important churches—such as Saint Paulinien, Saint Maria at Capellen, the Apostles, Saint Martin, and most of them are vaulted. There are no central domes, with large windows, as in France, but as apses on three sides, give each interior greater unity and grandeur than any other type in Europe. German churches have many peculiarities not seen elsewhere, for example, the choir and transepts, one at each end, frequently common in cathedrals of Worms and Mainz, Ancy of France, etc. So also is the alternation of piers and piers between nave and aisle, e.g. Germolde and Saint Godhard, Hildesheim. Round and octagonal towers are grouped about chieftowers and transepts in a way that greatly adds to the richness and symmetry of the exterior, besides the larger towers at the facade and over the intersection. No other country has so symmetrical a composition of exteriors. This is carried to great perfection in the Cathedral of Bonn. On the other hand, the interiors are bare and heavy, and there is no wealth of decorative and figured sculpture such as we find in France. Columnar basilicas were built, as at Limburg and Hersfeld, where was the most important, Hirsau, and many other places. But the pier-basilica was the commoner type. The great similarity to the Lombard churches in the exterior decoration of lines of false arcades and small open galleries proves that there was a close contact between these schools and the Rhenish, though the German is superior in beauty and picturesqueness. Besides the churches and monasteries there is a group of civil structures, the like of which was unknown in the rest of Europe; namely, the imperial and royal palaces. Starting with the type developed by Charlemagne at Aix-la-Chapelle, there follow the palace of Henry III. at Goslar, that of Henry the Lion at Brunswick, and that of Louis III. of Thuringia at the Wartburg, best known of all.

ENGLAND. The extant architecture of Christian England antedating the Norman Conquest is very scanty. It is called Anglo-Saxon, because developed under the Saxon rulers between the seventh and eleventh centuries. The great majority of both religious and civil buildings were of wood. Even the stone cathedrals of later date (tenth to eleventh century) were small and were rebuilt by the Normans shortly after the Conquest. The workmanship was primitive, the details poor, as in the case of the tower at Earl's Barton, where the colonnettes are like turned work, and the corner quoining suggests bands of metal (Dorchester, Sompting, etc.). The Norman style was introduced from Normandy even before the Conquest, under Edward the Confessor, but the earlier Norman work, before 1125, was poor, with wide jointed masonry and details executed with the axe. The chapel of the London Tower, the crypts and the transepts of Winchester Cathedral, and parts of Gloucester, Durham, Canterbury, and Norwich cathedrals show the primitive style, which was inferior to that in Normandy itself. About 1120 was begun a series of superb Norman structures, and by 1200 the main portions of Ely, Durham, Peterborough, Norwich, Rochester, Gloucester, Saint Albans, Carlisle, and other cathedrals were built, as well as a great

number of monasteries—especially Cistercian—such as Rievaulx, Fountains, Kirkstall, Waltham, Ramsey, and Malmsbury. The characteristics of this style are heavy walls and piers, rich details, length and narrowness of plan, inability to vault wide spaces, lack of figured sculpture, constant use of geometric and schematic ornament, and use of both round and grouped piers. The portals are especially rich and deeply recessed, and their most characteristic ornaments are in the zigzag and beak molding. The naves are all covered with wooden roofs, but the aisles are often groin-vaulted. Especial prominence was given to the triforia, which form lofty galleries over the aisles. Few of the original façades remain for comparison with contemporary Continental examples. Of all phases of the Romanesque the Norman is the heaviest, makes the least use of vaulting (except the Tuscan), and is the least well composed, though often impressive. Toward the close of the twelfth century the heaviness diminishes, and certain parts of Ely and Norwich are charmingly symmetrical.

SPAIN. The Spanish Romanesque style commenced early in the ninth century under King Alfonso II. of Asturias, with the renewed life of Christian Spain. The new capital, Oviedo (San Tirso, San Julian), and the neighboring Naranco (Santa Maria, San Migne) show a mixture of early Christian and Byzantine influences (c.800-850), as do later churches at Valdedios, Prieaca, and Barcelona. Moorish influence also becomes prominent. With the eleventh century the south of France inspires the Spanish school in its further revival. The increased prosperity of the Christian cities of Spain, to many of which French bishops were appointed, caused a revival in cathedral architecture, which adopted the vault in all its forms, the tunneled being used ordinarily for the nave, the groined for the aisles. San Isidoro at Leon, the old Cathedral of Salamanca, that of Zamora, the church at Toro, and San Iago at Compostella are characteristic examples, Salamanca being the earliest and San Iago the most consummate work. These Spanish churches are grandiose and equal to the foremost French buildings, even surpassing them in some features, such as the effective dome over the intersection of Compostella. Examples of tunnel-vaulted hall-churches are at Gerona, Huesca, and Segovia, similar to those of Provence and Languedoc. The most important groin-vaulted churches are Santa Maria at Tudela and the cathedrals of Tarragona and Lérida, remarkable for unity of plan, solidity of construction, and beauty of detail. They bear great similarity to the school of Anjou. San Vicente at Avila has the most interesting figured sculptures on its façade and an exceptionally beautiful triforium gallery. The Spanish school reaches its most glorious period when the time approaches, toward 1200, for France to give her the Gothic as she had the Romanesque.

SCULPTURE.

In the minor forms of sculpture, Byzantine and early Christian models were generally followed during the Romanesque epoch (see BYZANTINE ART), the awakening of monumental sculpture having been due to the demand for architectural decoration.

FRANCE. Such was particularly the case during the Carolingian revival in France and Germany. In the south of France, however, stone

sculpture on a larger scale was used in connection with church architecture. The façades were crowded with statues, often representing a larger composition; statues even took the place of columns in the cloisters. Technically inferior to those of the succeeding Gothic period, they were more characteristic and individual. The school of Provence was dignified and quiet in character, concealing technical deficiencies by rich decoration; that of Burgundy, more finished in technique, more fanciful and inventive, but grotesque and dramatic; that of Toulouse, more finished and studied. A curious combination of Carolingian and Byzantine influence is shown by the school which in the first half of the twelfth century created the fine façade of Angoulême, the entire sculptures of which form one composition, a "Last Judgment," and the rich portal of Cahors.

GERMANY. During the ninth century carving in ivory, after early Christian and Byzantine models, was extensively practiced. An important centre was the Monastery of Saint Gall, where Tutilo was the chief master. Foreign influence rather increased under the Othos, being promoted by their frequent expeditions to Rome, and the marriage of Otho III. with the Byzantine Princess Theophano. Though ruder than their models, the native workmen display more naturalism and individuality. Monumental sculpture did not arise until the eleventh century, through the instrumentality of Bishop Bernward of Hildesheim. Impressed by the columns of Trajan and Marcus Aurelius at Rome, he erected one of his own at Hildesheim, besides furnishing his own cathedral with bronze doors. His school was especially occupied with articles of church furniture, and invented bronze sepulchral slabs. Among its most important productions are the portals of the cathedrals at Augsburg, Verona, and Gnesen, the baptismal font of Merseburg, and especially the beautiful gold altar front which Henry II. presented to the cathedral at Basel.

ITALY. During the twelfth century, in connection with façade decoration, a species of Romanesque sculpture originated in Lombardy and Tuscany, which during the thirteenth century was applied to interior decoration as well. Its technique was rude, the figures being short and coarse, the expression and dramatic action childish, the draperies very primitive. The best work of this school is found in Lombardy, especially in the cathedrals of Modena and Ferrara, in Saint Zeno, and the Cathedral at Verona. During the later twelfth century considerable progress was made by Benedetto Antelami, whose sculptures in the Cathedral of Parma and the neighboring Borgo San Donnino show nature study and a sense of form and motion. At Venice Byzantine influence prevailed, but the sculptures of the main portal of Saint Mark, and, in the interior, the angels under the cupola are Romanesque in character. The Tuscan sculptures are more primitive in character; the revival under Niccola Pisano in the thirteenth century is of sufficient importance for general development to merit treatment in the article SCULPTURE.

PAINTING.

GERMANY. Mural painting was extensively practiced under the patronage of Charles the Great, but of the decorations which we know existed in the royal palace and in the churches no

examples survive. Contemporary miniatures, however, which correspond in the main with these frescoes, reveal an art still following early Christian traditions in general plan, but possessing a highly developed system of ornament, Germanic in character. Under the successors of Charles painting declined, but with the development of Romanesque architecture it found increased employment, as early as the ninth century, on the large wall surfaces of most German churches. These paintings are executed with rapid technique, and are decorative in color and design, the background being generally blue, the colors light, and the halos of saints and borders of costumes laid over with gold. Though inferior to contemporary Byzantine art in technique, they contain elements which it lacks—life, character, and action. The oldest examples are in the Church of Oberzell in the island of Reichenau (tenth century); of better quality are, among others, the paintings in the lower Church of Schwarzrheindorf (twelfth), and in the cathedrals of Brunswick and of Gurk in Carinthia (early thirteenth). Panel painting was also practiced, especially upon the ceilings of flat-roofed basilicas, of which the best example is that of Saint Michael's at Hildesheim (after 1186). Smaller panels upon gold backgrounds were also used, at first as the antependia of altars.

FRANCE AND ITALY. Romanesque wall paintings in France are not so common, the most important being in the central provinces—in the chapel at Liget (Indre-et-Loire), in Saint Jean at Poitiers, and Saint Savin at Poitou—all dating from the twelfth century. In Italy painting lagged far behind, being purely mechanical, and for the most part under Byzantine influence. Roman examples of the period are excessively rude, while the frescoes at Sant' Angelo in Formis at Capua, like others in Southern Italy, were probably executed by native artists under Greek influence. In the mosaics of the period Italian pictorial art found its best expression, especially in those at Venice and in Sicily. (See MOSAIC.) They, as well as other paintings, were dominated by Byzantium, which throughout the epoch also influenced painting in France, and to a less extent in Germany.

ROMANINO, ró-má-nó'no, GEROLAMO (1485-1566). An Italian painter of the Venetian school, born in Brescia. He was probably a pupil of Veronese, or Cavedon, and is little known outside Italy. He painted chiefly in his native city, and most of his work is to be found there and in the surrounding country. He was a fine colorist, with peculiar skill and clarity in the use of light and shade, and was uneven in his treatment. His works include a large "Madonna," in the Doria Gallery at Rome, attributed to him by Morelli; "Nativity," 1525, in the National Gallery, London; a "Madonna and Saints" (1513), in the Padua Gallery; and a "Last Supper," in the same place. He also left a few notable portraits.

ROMAN LAW. See CIVIL LAW.

ROMANOFF, ró-má'no'f. The Imperial House of Russia. It first appears in the fourteenth century when Andrew Kobyla came from Prussia to Moscow (1341) and entered the service of the Grand Duke Simeon. The boyar Roman Yurievitch, the fifth in direct descent from Andrew, died in 1513, leaving a son and a daughter, the latter of whom became Czarina by her marriage with Ivan the Terrible (1517). The son, Nikita, was one of the regency during the minority of Feodor I., and his eldest son, Feodor, under the name of Philaret, was elevated to the rank of Archimandrite and Metropolitan of Rostov during the reign of the false Demetrius (1605-06). He refused to recognize the Polish Prince Ladislas as Czar of Russia in 1612, and for this the Poles took him with them on their retirement from Moscow in face of the nationalist rising, and held him captive for nine years. In February, 1613, the Russian nobles and clergy chose as their ruler Michael Feodorovich Romanoff, the son of the imprisoned Metropolitan, and the representative, through his grandmother, of the royal House of Rurik. He was succeeded by his eldest son, Alexis (1645-76). Alexis was twice married, and left by his first wife two sons, Feodor and Ivan, and several daughters, and by his second wife one son, Peter. His eldest son, Feodor (1672-82), died without issue, and was succeeded by his half brother, Peter the Great, with whom Ivan was associated until 1689. Peter was twice married; by his first marriage he had a son, Alexis, who died in his father's lifetime, leaving one son, Peter. Peter the Great was succeeded by his wife, Catharine I. (q.v.), by whom he had two daughters, Anna and Elizabeth. Catharine I. (1725-27) left the throne to the son of Alexis, Peter II. (1727-30), the last of the male line of Romanoff; and on his death without heirs the succession reverted to the female line, the daughter of Ivan, Peter the Great's half brother, Anna Ivanovna, being placed upon the throne (1730-40). She was succeeded by her infant grand-nephew, Ivan IV. (1740-41). A

revolution drove Ivan's family from the throne, of which the cadet female line in the person of Elizabeth (1741-62), the daughter of Peter the Great and Catharine, now obtained possession. On her death her nephew, Peter, the son of her elder sister Anna Petrovna, who had married the Duke of Holstein-Gottorp (belonging to a cadet line of the family of Oldenburg), mounted the throne as Peter III. (1762). He was dethroned and succeeded by his wife, the Princess Sophia Augusta of Anhalt-Zerbst, who reigned from 1762 to 1796 as Catharine II. She was succeeded by Paul I., her only son by Peter III. Paul (1796-1801) perished by assassination, leaving several sons, the eldest of whom was Alexander I. Alexander (1801-25) left no heir, and the crown at his death devolved by right upon his next brother, Constantine. Constantine, however, in compliance with the wish of Alexander, had previously relinquished his claims to the supreme power, and the third brother, Nicholas I., ascended the throne. Nicholas (1825-55) was succeeded by his son, Alexander II. (1855-81). Alexander II. was assassinated in 1881, and his son, Alexander III., succeeded him, to be followed in 1894 by his son, Nicholas II. Constant intermarriages with German princely houses have made the Romanoff strain of to-day far more German than Russian. Consult Edwards, *The Romanoffs: Tsars of Moscow and Emperors of Russia* (London, 1890).

ROMAN RELIGION. The attitude of the Romans toward their gods necessarily altered much with the numerous changes which accompanied the development of the little settlement on the Palatine into the mistress of the world. Yet the conservative nature of the Romans led to the preservation of many ancient rites, long after their origin had been forgotten and the ancient beliefs had passed away. Here, however, we are concerned less with this development than with a statement of the various elements which appear in the religion as recognized by the State, expressive of the official attitude toward the gods at the time of their adoption, and even when faith had failed, continued as essential parts of the governmental system. Such a statement is rendered extremely difficult by the absence of any natural development along discernible lines from primitive forms. The original religion of the early Romans has been so overlaid and transformed by the accretions of later times, and in particular by the assimilation of the whole structure of Greek mythology, that any summary reconstruction must give much that is rather probable than certain. Unfortunately, the most extensive alterations were already accomplished long before the Roman literary tradition began, and though such writers as Varro and Verrius Flaccus had many sources from which to draw, the origins were in most cases unknown to them, while Ovid in his *Fasti* is obviously strongly influenced by his Alexandrian models, and has frequently transformed Greek myths to fill the gaps caused by the lack of such stories in Roman tradition. The fundamental basis for the study of the early Roman religion is found in the Calendars or *Fasti*, of which some thirty are known, only one of which (the *Fasti Malliani*) is nearly perfect. All can be dated between B.C. 31 and A.D. 46 and are the result of the revision of the calendar by Julius Caesar. These documents, however, are

plainly composed of two elements, distinguished by the size of the letters, and it can scarcely be doubted that the large capitals represent the official pre-Julian Calendar, as published, we are told, for the first time in B.C. 304, to make known the days when business could be legally transacted. The names and days of 45 public festivals (*feria publica*) of fixed dates were indicated. This calendar is supplemented by the literary tradition, which largely rests on the lost works of the great Roman antiquaries, and in the use of which it is necessary to distinguish sharply between the statements as to actual religious observances and the deductions or explanations evolved by the writers themselves.

The Roman ritual clearly distinguishes two classes of gods, the *di indigetes* and the *di novensides* (or *novensiles*). The latter were the new introductions, and in fact we find that all divinities whose cults were introduced in historical times were reckoned among them. It seems reasonable to see in the *Indigetes* the original gods of the Roman State, and their names and nature are indicated by the priests of the first class, and the fixed festivals of the Calendar, supplemented by other notices; for though the Calendar was not published until B.C. 304, it had long been in existence as part of the secret knowledge of the pontiffs, and there is good reason for believing that it goes back to an early stage in the regal period. This analysis yields a list of over 30 names honored with special festivals or special priests, and showing on the whole a well-defined field of activity, which is appropriate to a distinct type of community. Moreover, there is a strong tendency to incorporate in a pair of male and female divinities either the same function or two complementary fields of activity. So we have Jouis and Juno (Juno), Faunus and Fauna, Janus and Vesta, etc. In most cases the female divinities have no independent cult and gradually fade away. Vesta, of course, is a marked exception, and Juno an apparent one, though here the later prominence of the goddess is due to the independent development of foreign elements. In addition to these gods, who seem to have attained a special prominence, there is evidence that the early Roman religion worshiped a host of 'specialist gods,' as they have well been termed. Fragments of old ritual accompanying various acts, such as plowing or sowing, show that at every stage of the operation a separate deity was invoked, whose name is regularly derived from the verb for the operation. Such divinities also may well be grouped under the general term of attendant or auxiliary gods, whom we find invoked along with greater deities. At the head of this early pantheon stand five names: Janus, Jove, Mars, Quirinus, and Vesta, of whom the second, third, and fourth form an ancient triad, while their special priests are the three greater Flamens, *Dialis, Martialis, Quirinalis*, and the first and fifth are said to be the proper gods to begin and end any invocation of a number of divinities; and a similar position, before and after the three Flamens, is held by representative priests, the *Res sacrorum* and the *Pontifex maximus*. The *Indigetes* and their festivals show that we are dealing with an agricultural community, but also one fond of fighting and much engaged in war. The gods represent distinctly the practical needs of daily life, as felt by the Roman community to which

they belong, and which scrupulously pays them the proper rites and offerings. Thus Janus and Vesta guard the door and the hearth, the Lar protects the field, Pales the pasture, Saturnus the sowing, Causus and Ops the harvest, Ceres the growth of the grain, and Pomona the fruit. Even Jupiter, who seems to be the god of heaven, is honored chiefly for the aid his rains may give to the farms and vineyards, though he also, through the lightning, guides the acts of men, and by his widespread domain can aid Romans outside their borders. That war was a large part of this early life seems clear from the prominence given to the two war gods, Mars and Quirinus, of whom the former was specially honored in March and October, i. e. at the opening and closing of the campaign, while the latter seems to be patron of the armed community in time of peace. In this early stage of the Roman religion there seem to be no temples or images of the gods, who are worshipped in sacred groves, or at altars in the open air; Vesta, as her nature requires, has her own house. In fact, there is no real individuality in these early gods, nor are there any marriages or genealogies. Mythology is not a Roman invention. The scanty traces of legend sometimes gather about a sacred animal, which is a sign of the presence of the deity or some token which could recall him to the worshiper, such as the flint of Jupiter, or the spear and shields borne by the Salii in honor of Mars. This older worship is associated by Roman legend with the early days of the city, and especially with Numa Pompilius, and though the name may be an invention, the location of the sanctuaries indicates an early period in the growth of the city.

At an early date, however, new elements were added to this ancient system. The legend ascribes to the royal house of Tarquin the establishment of the great Capitoline triad, of Jupiter Optimus Maximus, Juno, and Minerva, which soon assumed the supreme place in the Roman religion. Other additions were the worship of Diana on the Aventine, and the introduction of the Sibylline Books, and the appointment of men to care for them, and to carry out the sacred rites which they directed. All these changes are the introduction of foreign cults: partly apparently from the Latin league in which Rome had acquired a leading position, partly from Etruria, where, however, Greek influence had also been at work, and partly from the Greek cities of Southern Italy, especially Cuma, with which legend directly connects the Sibylline Books. This new movement brings with it temples, built at first in the Etruscan style and apparently by Etruscan architects, though later by Greeks. The Capitoline sanctuary became the central shrine of the Roman State, and one of the privileges granted a colony (*colonia*) was the right to found a similar Capitolium in honor of the three gods. Thus, though a later introduction, these new deities quickly assumed a place beside or even above the ancient gods, and their representatives were recognized as equal members of the hierarchy. From this time, which must have preceded the establishment of the Republic, the history of the Roman religion is that of a constantly increasing number of divinities. The cults brought from foreign parts, especially Greek lands, under the direction of the oracular books and requiring the importation of a native priest-

hood, were carefully kept outside the Pomernum, and when such Greek gods as the Dioscuri had a temple in the Forum, the apparent exception is easily explained by the high position of Castor and Pollux at Tusculum, whence their worship was brought to Rome.

The absorption of the neighboring native gods is easily understood. Since the earlier gods had been regarded as peculiar to the Roman State, as that State grew and conquered the surrounding territory, the new local gods became entitled to receive at the hands of the Roman those honors which had before been their own. In many cases we hear of a formal invitation to these gods to take up their abode in the new sanctuaries provided at Rome. More yet, the growth of the city attracted foreigners, who were allowed to continue the worship of their own gods. Besides Castor and Pollux the Italian communities seem to have contributed to the Roman pantheon Diana, Minerva, Hercules, Venus, and others of lesser rank, some of whom of course were originally derived from Greece, though others may well have been Hellenized from Italian divinities. From the Greeks came at an early date Apollo, and in B. C. 496 the Sibylline Books ordered atonement to Demeter, Dionysus, and Kore, whose temple was dedicated under the Latin name of Ceres, Liber, and Libera, through an identification of the Greek divinities with the old Roman gods. About the same time Hermes, under the name Mercurius, was recognized as the god of merchants and trade. Both these cults are connected by legends with a famine, which may well have led to their introduction along with the grain of the south. Poseidon appears among the Roman gods under the name of an old Italian divinity, Neptunus, as early as B. C. 399. These cults seem all to have been introduced at a relatively early date in the history of the Republic; and then for a time the expansion seems to have taken place rather by the assimilation of Italian divinities, often as new phases of the old cults, or by the creation of new gods, especially from abstract qualities such as Fides (Fidelity) or Bellona (as goddess of war). In B. C. 293, however, under the destruction wrought by a severe plague, the Sibylline Books advised summoning the god Esculapius from Epilaurus. In B. C. 249 followed the introduction of the cult of Hades and Persephone under the Latinized names of Dis Pater and Proserpina, and in their honor the first celebration of the ceremonies from which developed the secular games (q. v.). In B. C. 205 the circle was further widened by the presence of the first of the Eastern gods, Cybele, the *agna mater*, whose sacred stone, probably meteoric, was brought with great pomp and amid many miracles from Pergamum, through the favor of Attalus, who seems to have secured it from the holy temple of Pessinus.

At the same time the process of Hellenization was advancing in other ways, and the pressure of the Second Punic War seems to have aided its progress, from the need then felt of appeasing the angry gods by more powerful atonements. Now we find a cycle of twelve gods (*duodecimviti*) obviously derived from the Greek, though the divinities are partly Roman, officially recognized by statues in the Forum, and from this time we hear little of the introduction of new Greek divinities; the change takes place rather in the identification of Greek gods with Roman, and the

consequent transference to the Roman deities of a large mass of Greek myths, whereby the original nature of the gods was more and more obscured. Moreover, the newly developing Roman literature was so thoroughly saturated with Greek thought even where it was not direct translation, that it powerfully aided in popularizing Hellenic conceptions.

With the coming of Cybele the orgiastic element was added to the attractiveness of the Greek ceremonial, and in spite of some efforts at restriction speedily exercised a destructive influence, which reached its height a few years later when the orgies of the Bacchanalia called for the severest measures from the Senate. The tendency, however, was not to be checked, and the long wars in Asia Minor, the seat of strange cults, together with the growing disbelief in the old gods and the search for new superstitions among many belonging to the upper classes, furnished abundant material for its growth. Asiatic, Egyptian, and even Semitic cults of farther east poured into Rome under the Empire until they had almost supplanted the old religion in the popular mind.

The effect of the transference of Greek myths to the State religion, and perhaps even more of the prevalence of Greek philosophy among the educated, was to bring about an increasing neglect of the old rites, and in the first century B.C. the old priestly offices declined rapidly, for the men whose birth called them to these duties had no belief in the rites, except perhaps as a political necessity, so that pontiffs, augurs, and such bodies became mere tools in the party strife. A thorough reform and restoration of the old system was carried out by the Emperor Augustus, who became himself a member of all the great priestly colleges, revived some that had become extinct, such as the Arval Brothers, and rebuilt temples which had fallen into ruin. With all this revival was joined the prominence given to Apollo as a patron god of the Emperor, through the erection of the splendid temple on the Palatine, the intrusting to its guardianship the State collection of oracles, including the Sibylline Books, and the joining Apollo and Diana with the Capitoline gods in the secular games. In spite of these reforms, the religion tended more and more to centre in the Imperial house, and this was stimulated by the dedication of certain emperors, with the title *divus*. At first the honor of reception among the gods of the Roman State after death was bestowed upon but few. The first was Julius Cæsar, then follow Augustus, Claudius, Vespasian, and Titus, while after Nerva few emperors failed to receive this distinction. This cult was more prominent at first in the provinces than in Rome, and it was outside that the actual worship of a goddess *Roma* seems to have arisen. The personified *Roma* had appeared on coins and elsewhere, and had been the object of foreign dedications under the Republic, but her reception among the State divinities was due to the erection of the great temple of Venus and Rome by Hadrian in A.D. 128.

The forms of the Roman religion were naturally as varied as the origins of the numerous cults which it included. The early worship seems to have been marked by the simplicity to be expected from such a community as gave it birth. The first fruits of field or garden, or flocks, flowers, and wreaths, the coarse pounded

grain, and cakes were the usual gifts, which on some occasions took the form of a meal set before the god. Such offerings might be made by family or community at their own altars, and when made by the State differed only in the size of the offering, so that public animal sacrifices, especially of the larger animals, were more frequent. But if the offering was simple the ritual was complex. The vessels and implements were prescribed and bespeak the primitive civilization of the early worship. On some occasions at any rate the sacrificial knife was of flint, the vessels of clay, molded without the aid of the potter's wheel, and the victims must correspond exactly to the minute requirements of the law. The prayers and gestures of the priest were prescribed in detail and must be repeated with the most scrupulous accuracy, so that it is easy to see the importance of the college of pontiffs in whose charge were the books of ritual, and without whose assistance few magistrates could have performed their religious duties. The *Grævus ritus* naturally was conducted according to the usages of the country from which the god had been brought, but the Hellenization brought the increase of *ludi*, or games and spectacles, as part of the worship, and especially the institution of the *supplicatio* and *lectisternium*, wherein the gods were placed on couches beside prepared tables, and feasted for one or more days, while at the same time the people were summoned to visit the temples and pray, either in supplication if the celebration sought some gain, or in thanksgiving if a victory was the occasion. The *lectisternium* or banqueting of the god also took place in his temple on the day of its special festival, but in its extended form, when several gods were brought together into one place for the banquet, regularly formed part of a solemn act of purification and entreaty or of special thanksgiving.

This whole structure rested on the Roman theory of a legal relation between men and gods. Worship is an ordinance of the State, established by the fathers and unalterably binding on the children; and it is exactly the gods thus adopted at the founding of the State, the *di indigetes*, that have such a special position in the possession of a special hierarchy and the intricate ritual. To these old obligations new ones temporary or lasting were added from time to time by the vow public or private, in which the supplicant solemnly promised to pay to the god certain honors if his prayer was heard, and when uttered by a representative of the State in his official capacity this became binding on the whole community.

For further details of the Roman religious system, see the articles on the individual gods and also ARVAL BROTHERS; AUGURIES AND AUSPICES; FLAMENS; LUPERCALIA; PONTIFEX; SALII; SVOVETURILIA; VESTA.

BIBLIOGRAPHY. The best condensed account of the subject is by Wissowa, "Religion und Kultus der Römer," in Müller's *Handbuch der Klassischen Altertumswissenschaft* (Munich, 1902). ROMANS, rō'mān'. A town in the Department of Drôme, France, on the right bank of the Isère, 11 miles northeast of Valence (Map; France, M 6). A bridge built in the ninth century connects Romans with the small town of Péage on the left bank of the river. Romans owes its origin to an important abbey, founded in the ninth century by Saint Bernard, Archbishop of Vienna, and by a nobleman named Romain, who gave his name to the town. Silk and woolen fabrics, leather, shoes, hats, and oils are largely manufactured, and a very active general trade is carried on. Population, in 1901, 17,140.

ROMANS, EPISTLE TO THE (translation of Gk. ἐπιστολὴ πρὸς Ῥωμαίους, *epistolē pros Rhōmaious*). One of the New Testament letters of the Apostle Paul and the one generally recognized as his most important production. It was written in the winter of 55-56, or the early spring of 56, at the close of the Apostle's third missionary journey, during his last visit to Corinth, after he had practically finished his work in the East. It was addressed to the church at Rome, which he had not founded or even seen, largely for the purpose of preparing for the visit which he hoped soon to make.

Its Pauline origin has received practically universal recognition, even the Tübingen School (1845) accepting it as one of the five New Testament books which they held to be genuine. It is rejected by the Modern Dutch School (1882) in accordance with their rejection of the entire New Testament—generally speaking. This position, however, is largely ignored by scholars today, in view of what are thought to be the unscientific principles on which it is based. A characteristic feature of this school's criticism is its tendency to consider the epistolary as well as the historical books of composite origin, the application of which tendency to Romans has been made by several writers beyond the distinct membership of the school. But the results claimed for this documentary handling of the Epistles have met with such scant acceptance by the critical world that they have been practically neglected in the estimate of the genuineness of these writings. This is especially true in the case of Romans.

The three questions of present interest in the study of the Epistle are (1) the relation of the last chapter to the rest of the letter, (2) the national character of the membership of the Church, and (3) the situation in the Church which the letter was intended to meet. As to the first question, there can be little doubt that there are striking peculiarities in the closing portion of the Epistle, as it now stands. (1) In the sequence of thought it is noticeable that the benediction occurs twice—once at verse 20

in chap. xvi, and, previously, at the last verse of chap. xv. In sympathy with this benedictory repetition there seem to be other endings to the Epistle besides that at its close, viz. at verse 20 of chap. xvi (vs. 17-20), at verse 33 of chap. xv (vs. 30-33), and, in addition to these, at verse 16 of chap. xvi (vs. 3-16). (2) In the contents of the chapter it is marked that in a church which Paul had neither founded nor visited there should be so many personal acquaintances and fellow companions with him in his work (cf. especially vs. 3, 4, 7, 9, 11, 13). To account for these peculiarities several theories have been advanced, the most widely accepted of which is perhaps the one first proposed by Schulz (1829) and adopted by many scholars since his day, viz. that this last chapter belongs to a letter addressed by Paul to Ephesus, where he had been at work for some years. It is true that with the circumstances and surroundings of Paul's Ephesian work, several of the names seem strikingly in accord (e.g. Priscilla and Aquila [cf. 1 Cor. xvi. 19, 11 Tim. iv. 19] and Epametus, who is spoken of as "the first fruits of Achaia unto Christ"). More than this, the fact that this last chapter was written from Corinth or its neighborhood (xvi. 1), and that between this city and Ephesus Paul had frequent communication on church affairs, might not only account for the direction in which the letter was sent, but also for its coming to be attached to the Epistle to Rome; since, if copies of both letters were retained in Corinth, the distinction between them might finally disappear and they be thought to be parts of one letter. This would be especially true if, in the course of time, the letters came to be mutilated. Fragments are naturally pieced together. Finally, the omission of this last chapter—and even the one preceding it—in some important manuscripts, and the fact that the doxology which now stands at the end of chap. xvi (vs. 25-27) evidently stood originally at the end of chap. xiv, would seem to point to the possibility of there being at least two letters combined in our present Epistle. On the other hand, when it is remembered that the Epistle was at a very early date altered for dogmatic and liturgical purposes, and that the position of the doxology at the end of chap. xiv is in accord with Paul's habit of introducing such passages into the body of his letters rather than reserving them for the end; further, when it is recognized that it was Paul's custom to append to a marked degree personal salutations to the letters, he wrote to churches he had not founded and in which he had not worked (cf. the concluding chapter of Colossians with those of Thessalonians, Corinthians, Galatians, and Philippians); and when it is realized that the Church at Rome was not only largely Gentile in its membership (i. 5-7, 13-15; vi. 13, 14; xv. 14-16), but that the irresistible drift from all parts of the Empire to Rome must have carried with it many of the converts from Paul's eastern mission fields, especially from the large cities of Antioch, Ephesus, and Corinth; and when it is understood that from imperial inscriptions in Rome and inscriptions containing names belonging to freedmen and members of the imperial household, practically all the names in chap. xvi can be shown to be possible Roman names, while from Ephesian inscriptions and from those of the Western Asia

region in which the Apostle's work was done, only a small proportion of them are so traceable—when these facts are taken into consideration much is disclosed in favor of the view held by a considerable number of modern scholars that the chapter is an integral part of the Epistle to Rome. In the case of either theory, however, the difficulty in the repetition of the benediction and the apparently final passages would be referred to the Apostle's occasional habit of interrupted closing thought, as manifested in admittedly Pauline Epistles like Philippians (cf. iv. 7, 9, 20, 23; see also II. Thess. ii. 16, iii. 5, 16, 18), although the Ephesian theory has manifestly less of this repetition to account for.

As to the second question, while there is essential agreement as to the mixed character of the church's membership, there is considerable discussion as to whether the dominant element in the church was Jewish or Gentile. On the one side passages such as vii. 1-6, viii. 15, ix. 1-5, x. 1-3 are appealed to as showing a recognition by the Apostle of the Hebrew character of the church to which he was writing. On the other side passages such as i. 13-17, xi. 13-32, xv. 14-17 are cited as showing the consciousness on the Apostle's part that he was writing to a church to which his Gentile apostleship specifically commended him.

As to the third question, it is clearly the one of greatest significance, since an understanding of the situation of the church to which the Apostle is writing must contribute definitely toward determining our understanding of the purpose behind the letter's writing, and an understanding of this must largely determine our understanding of the letter itself. In general, of course, this purpose was what we have stated: a desire on the Apostle's part to prepare the way for his coming visit to this stranger church; but, while this desire may account for the sending of a letter in advance of his expected departure for the west, the specific character of the letter so sent must be accounted for by something beyond this general desire. This something is primarily the condition of the church to which he is writing; for Paul's letters were all determined by the necessities they were intended to meet. The views as to what the situation was are legion, though perhaps they may be roughly gathered into three groups: (1) The group which holds that either through the importance of the church as a church, or through its unacquaintance with the Apostle as a teacher, it invited him to a systematic presentation of Christian truth. This is the oldest view and the one which has most generally prevailed. It has in its favor the peculiarly systematic character of the Epistle, unique among Paul's writings; but against it is the fact that the system presented is manifestly incomplete. Within the range of Christian truth there are practically but two topics presented; the doctrine of man and the doctrine of salvation. This restriction is recognized by some of those who hold this view, and to account for it they suggest that it was the Apostle's idea to emphasize that portion of the general truth of Christianity which was characteristic of his Gospel. This, however, would be fatal to the view itself, while it would raise at once the query how it came that a church, such a proportion of whose active workers were either converts from the Apostle's mission field or personally

acquainted with his work, should need an exposition of the Gospel he characteristically preached. (2) The group which holds that through either the actual presence or the threatened coming of Judaizing teachers the church was in need of a vigorous combating of their peculiar errors. This was the view proposed by the Tübingen School and participated in the wide success which the school's critical position secured for itself. In its favor is (a) the polemic tone of certain parts of the Epistle, notably in chaps. ii-iv., vi., ix.-xi., which seem to betray a conflict between the Jewish and Gentile elements in the church, together with (b) such references to partisan conditions in the church as are given by chaps. xii., xiv.-xvii., though these do not necessarily involve Judaizing dissensions. Opposed to it, however, is the fact that the Epistle really gives no sign of the presence or the expectation of Judaizers in the church. Neither the polemical nor the partisan passages above referred to imply a Judaistic situation. The Epistle is not a controversial writing as Galatians and II. Corinthians are, in spite of its polemic tone. Indeed, the peculiar Gentile character of the church makes the likelihood of such a propaganda exceedingly remote. Rome was the last place to which such a party would drift. (3) The group which holds that the acknowledged partisan condition of the church was of a character that called for an irenic treatment on the Apostle's part. This was suggested as early as Augustine, reappearing subsequently at times. It has come into favor lately largely through the growing conviction of the untenableness of the other views. There is much in its favor, especially the characteristic combination of Jew and Gentile in the earlier part of the Epistle, and yet the question forces itself upon us: If this view be correct, how are we to understand the pronounced Gentile rebuke contained in chaps. ix.-xi.? From all this it is apparent that no one of these groups will fully account for the phenomena which the Epistle presents. The problem, therefore, may be said to be still under discussion.

ROMANS, KING OF THE. A name applied to the elective head of the Holy Roman Empire (q.v.) before his coronation as Emperor by the Pope; he was also known as the German King. After 962 the German King was regarded as having a prescriptive right to the Imperial title, *Imperator Romanorum*, and thus in the course of time the candidate for the Empire came to be known by anticipation as *Rex Romanorum*. Charles V. was the last head of the Holy Roman Empire to be crowned by the Pope, and beginning with his successor, Ferdinand I., the King of the Romans was also styled Elected Roman Emperor. The King of the Romans was as a rule elected during the lifetime of the Emperor. Napoleon I., who aspired to the traditions of the older Empire, named his son King of Rome.

ROMANSH. See ROMANCE LANGUAGES.

ROMANTICISM (from *romantic*, Fr. *romantique*, from OE., Fr. *roman*, novel, romance). A term commonly employed to designate the modern rise and development of imagination and sensibility in the literatures of Western Europe, and to indicate the tendency of nineteenth-century authors to rid literature of Greek and Roman rule. Romanticism, as a tendency, is sometimes opposed to the restraint of classicism, and again to the literalness of realism. On the one hand classicism, which had once been so warmly espoused by the humanists, had degenerated into a feeble effort to express the modern world in a high-flown but lifeless jargon in which mythological references still abounded. This was especially true of the drama. On the other hand, a certain school of realists, who came after the tide of romanticism had begun to ebb, hampered their imaginations for the sake of what they believed to be scientific transcriptions of life. Against these realists the later romanticists rebelled. It may be said that realists and romanticists (or romancers) have worked peacefully side by side since as early as 1850, and both schools have found common readers.

In the Augustan period English literature, barren of strong passion except the indignation of satire, made its primary appeal to the intellect; its ideal was 'good sense.' Pope reasoned in verse, writing essays in criticism and in morals; Swift employed the fantastic romance to satirize his contemporaries and mankind as a species; Addison ridiculed with urbanity the follies of society; and rarely did any writer look beyond London. It was the province of romanticism to rediscover that man is more than intellect; that he possesses imagination and emotions. Between 1726 and 1730 James Thomson, a Scotch poet, published his *Seasons*, poems which definitely mark a new interest in external nature. He was followed during the next few years by many imitators, known as the landscape poets;

then came Gray's "Elegy in a Country Church-yard," Goldsmith's "Deserted Village," and Cowper's "Task." This descriptive poetry reached its highest development in Scott, Byron, Keats, Wordsworth, and Shelley, who lent to nature "the light that never was on sea or land." By the middle of the eighteenth century the lyrical city, which had long been suppressed in English literature, broke forth once more. At first it was a refined melancholy, as in Collins and Gray; afterwards it breathed into a noble humanity in Cowper, Burns, and Wordsworth. Finally passion and description were fused in the lyrics of Shelley, where, says Woodberry, "nature is emptied of her contents to become the pure inhabitation of the human soul." Again, the arts of Pope and Addison had lost the mood of superstition and wonder. That mood soon returned, and as the date for it we may cite Collins's "Ode on the Popular Superstitions of the Highlands of Scotland" (written in 1709). In 1764 Horace Walpole published the *Castle of Otranto*, which initiated the romance of the ghost and the nightmare. This kind of literature was spiritualized by Coleridge in the "Rime of the Ancient Mariner" (1798). Moreover, the first half of the eighteenth century cared little for the past. On history Fielding was very satirical, declaring that there was more truth in *Tom Jones* than in Lord Clarendon. But with the ghost came history, which was incorporated into romance. Most of these characteristics of romanticism—the love of the picturesque, history, and superstition—found combined expression in Scott, first in his verse tales and afterwards in the Waverley novels. It is, however, to be noted that Scott was rarely lyrical, and that the supernatural awakened in him little of the mystic's awe. For mysticism, which was becoming one of the notes of romanticism, we have to look rather to the neoplatonism of Wordsworth, the pantheism of Shelley, and, for its full development, to the Pre-Raphaelite Brotherhood (see PRE-RAPHAELITES), of which Rossetti was the central figure.

For their matter the romanticists turned to our earlier literature; to Milton, Spenser, Shakespeare, to ballads, metrical romances, Celtic and Norse stories, Greek art and literature, and later to Dante. In this search for what was new they were much aided by scholars. In 1755 P. H. Mallet, a native of Geneva, and professor of belles lettres at the University in Copenhagen, published the first part of his *Histoire de Danemark*, of which an English translation by Thomas Percy appeared in 1770. This book first made generally known to England the gist of the Eddas. Five years before Percy had published a collection of English and Scotch ballads under the title of *Reliques of Ancient English Poetry*. This ballad book has been aptly called "the Bible of the romantic reformation." An other publication of great influence was Macpherson's *Ossian* (1760-65), a series of prose poems, in which some use was made of Celtic motives. The romanticists also had their advocates in criticism. In 1734 appeared Thomas Warton's *Observations on the Faery Queen of Spenser*, a measured defense of romantic themes. Two years later Joseph Warton published an *Essay on Pope*, one of the most important contributions to romantic criticism. Pope, who had been regarded as the most correct of English poets, Warton placed below Milton and Spenser,

and added that he was surpassed in some respects by Thomson and Gray. As marking the progress of romantic criticism from timidity to boldness, we should also mention *Letters on Chivalry and Romance* (1762), by Richard Hurd, in which Spenser was placed highest among English poets. The case of romanticism against classicism continued to be argued by many others. For example, W. L. Bowles issued in 1806 a new edition of Pope, which was prefaced by severe strictures. This publication led to a lively controversy, in which Byron took a prominent part on the side of Pope. By this time our old writers and the new romantic school were being interpreted in a sympathetic mood by Lamb and Hazlitt. To such an extent was romanticism thus a revival that literary historians have often defined it as a return to the Middle Ages. But it was no return; its product was unlike anything in the past. Mediæval and other literatures rather furnished it with motives and suggestions for as original work as any period of our literature can claim.

In their study of early poetry the romanticists naturally revived and modified old verse-forms. From the advent of Dryden to the death of Pope the heroic couplet reigned almost supreme. Written with a good deal of freedom at first, it had at length come to be very monotonous, with its fixed caesuras and pauses at the ends of the lines. Although some of the romanticists held to this couplet, they nevertheless broke it up, varying the caesuras and letting one line overflow into another or one couplet into another, without any stop whatever. In their first revolt from Pope the new poets, however, often imitated the blank verse and the octosyllables of Milton, the Spenserian stanza, ballad measures, and the Elizabethan sonnet. The movement toward a free versification has continued until to-day English poetry is richer in verse-forms than ever before. The English vocabulary has also been renovated. Into prose romance came, with Scott and his school down to Stevenson, old words and expressions; and the poets have ventured upon new and felicitous compounds. Perhaps the greatest gain to our language from romanticism has been the choice of words for their rich coloring and sounds.

In other countries the course and the results of romanticism were much the same as in England. The French date the beginning of the movement with Rousseau's cry of a return to nature (c.1750), and follow it through Chateaubriand to Victor Hugo and a group of his contemporaries. In her book on Germany (*De l'Allemagne*, 1810) Madame de Staël upheld romantic ideals and described for her classic compatriots the wonders of romantic literature in Germany. In his preface to *Cromwell* (1827) Hugo defended against classicism the grotesque in art, declaring it to be "one of the supreme beauties of the drama," and condemned the unities of time and place. Hugo demanded unrestrained liberty. He and his associates enriched the current literary vocabulary, freed French classic metre from its trammels, and recovered forgotten stanzas.

French romanticism owes a great deal to England, and Shakespeare seems to have been far more often in the thoughts of Hugo and his circle than was Rousseau. Shakespeare exemplified freedom for the drama. *Herani* (1830) was constructed in the Shakespearean spirit and it

aroused more hostility and enthusiasm than any other play by Victor Hugo. The French romanticists sought their inspirations far and near. Searching the literature of other nations, they found new worlds and extended the intellectual boundaries of France. Notwithstanding so much that is mawkish or extravagant in the French romantic period, it is an epoch as remarkable for its vitality, sympathy, and curiosity as the classic seventeenth century was remarkable for its logic and its limitations, both of horizon and of form.

In Germany the first announcement of romanticism was in 1773, when there appeared a collection of essays by Müser, Herder, and Goethe, entitled *Von deutscher Art und Kunst, einige fliegende Blätter* (fly-sheets on German style and art); great praise was bestowed on German folk-songs, Shakespeare, and Gothic architecture. The same year Goethe published *Götz von Berlichingen*, an historical drama, of which the hero is a robber-knight of the sixteenth century. Schiller also felt the romantic impulse at the beginning of his literary career. But Goethe and Schiller soon outlived their youthful extravagances, and in reaction from their classicism in the narrower sense of the term there arose the German romantic school, of which the official organ was the *Athenæum*, founded in 1798 by the Schlegels. Among other romanticists were Tieck and Novalis; and coming later and forming what is sometimes called the second romantic school, were Arnim, Brentano, the Grimms, and Uhland.

Like Chamisso, Heine composed ballads and allowed his mind to wander in a dream world. His poetic landscapes and his poetic incidents are romantic, but Heine had more than one side, and he expressed a great many human conditions without distortion. In the unfinished epic *Tristan und Isolde*, Immermann endeavored to quicken mediæval poetry. Gustav Freytag sought to breathe life into mediæval dust in *Die Ahnen*; Victor von Scheffel succeeded charmingly in his story of *Ekkehard*, and mediæval literature has since been cultivated, translated, and adapted by men like Wilhelm Hertz and Paul Heyse. That romanticism began in Germany, as has so often been asserted, is a theory which does not admit of demonstration. Until a rigid definition of romanticism shall have been accepted by all reputable critics, and until the works of a host of writers shall have been tested with this definition (which must necessarily be derived from the very men to whom it is applied), so long shall we be unable to honor any one country as the home or any one man as the founder of romanticism. Like realism (q.v.) and idealism, romanticism is a tendency, and we can find it not only in a Victor Hugo or a Wordsworth, but in a Cervantes, or in the adventures of Odysseus. Romanticism had its schools, its declarations, and its dogmas. These are more easily found and explained than the features which they impressed upon literature or the causes which gave them rise. In England, France, Germany, in Scandinavia, in Italy, and in Spain, romanticism flourished as something new and extraordinary until its novelty had worn off and its elements had been assimilated by literature.

Romanticism was everywhere—in England, France, Germany, Scandinavia, and Russia—a revolt, either silent or outspoken, from literary tradition of every description. Its boldest cham-

pions asserted the right of the man of letters to proceed untrammelled, to choose his themes from whatever source might please him and to treat them as he liked; and they further demanded that the product should be judged by itself, irrespective of what somebody else has done. Though no one country can definitely claim the glory of the achievement, it is yet to be observed that the awakening took place earliest in England. In literature the results have been greatest for England and France. Germany's poets of the first rank did not belong, strictly speaking, to either of her romantic schools. On the other hand, from one of the impulses of romanticism—the revival of heroic legend—has come that wider movement which has culminated for Germany in national unity.

ROMANTIC SCHOOL OF MUSIC. See MUSIC, SCHOOLS OF COMPOSITION.

ROMANUS. The name of four Byzantine emperors. ROMANUS I., LECAPEXUS, was Emperor from 919 to 944. He was born in Armenia of poor parents. He entered the Imperial fleet, was high admiral on the accession of Constantine VII., Porphyrogenitus, and by intrigue became Augustus in 919. His reign was filled with war; the Bulgarians were bought off in 926 and again a few years after; and in 941 Romanus was victorious over a great Russian fleet under Ingor. In 944 Constantine formed a league with Romanus's two sons, deposed him and forced him into a monastery, where he died after four years (948). Constantine's son, ROMANUS II. (c.939-963), succeeded his father in 959. He lived a life of ease and was poisoned by his wife, Theophano. His granddaughter Zoë was married by her father, Constantine VIII., to ROMANUS III., ARGYRUS (c.968-1034), who was compelled to divorce his first wife and assume the Empire in 1028. With an excellent policy, he was unsuccessful for lack of administrative ability. It is supposed that he was put out of the way by Zoë, who was in love with a general, Michael Paphlago. ROMANUS IV., DIOCENES (?-1071), made frequent attempts to revolt under Constantine Ducas, and after the latter's death was arrested on the charge of plotting against Eudoxia, Constantine's widow, whose passion for him as soon as she saw him rescued Romanus from death and brought him to the throne (1068). After a few years of successful war against the Seljuks, he was defeated by Alp-Arslan (q.v.),

and was killed in the same year by a revolution; any party in Constantinople.

ROMAN WALL. The remains of the line of defense erected by the Romans to protect the northern boundary of Britain. We first hear of such defenses against the tribes of Caledonia, when Agricola built a chain of forts to secure his conquest north of the Clyde. Of these, however, few, if any, traces remain, unless in a fort at Camelon, near Edinburgh. Across the narrow neck, about 35 miles in width, between the Firth of Forth and the Firth of Clyde, under the Emperor Antoninus Pius about A.D. 142, was built a rampart of turf, with a broad ditch on the north and a military road on the south. A chain of eighteen forts furnished stations for the garrisons. This line was held for less than fifty years, and then the Romans fell back to a southern line, already established by Hadrian, who crossed the island from the Solway to Newcastle on the Tyne. Here, about A.D. 120, there was a similar turf rampart, protected by a ditch and having a length of about 80 miles. Nearly ninety years later Septimius Severus seems to have replaced this by a stone wall, which followed in general the same course. This wall is still so far preserved as to be easily traced. South of it, at an irregular distance, ran the *vallum*, which was simply a broad ditch with a low mound on each side. It does not seem to have had a military purpose, but was apparently a boundary mark. South of this was a chain of detached forts, connected by a road, and with castles and watch towers at intervals.

The term Roman Wall is also sometimes applied to the *limes* or boundary wall or palisade erected by the Romans to mark the frontier between the Rhine and the Danube. This work was really in two sections. One, forming the northern boundary of Rætia, ran from Hienheim on the Danube, near Regensburg, almost due west to a point near Stuttgart; the other, starting from the Rhine, nearly opposite Rheinbrohl, ran at first southeast, and then turned more to the south until it joined the Rætian line. At first both were little more than a palisade and ditch, with a second line of wooden towers and fortified camps. Later the line of Upper Germania was defended by an earthen rampart, and that of Rætia by a stone wall. Stone camps and towers replaced the wooden structures of the second line. Similar forts defended the line of the Danube along Pannonia and Noricum, though here no outer boundary line was needed.

ROMBERG, röm'berk, AUSTRIAN (1797-1821). A German violinist and composer, born at Vöcklabruck, near Münster. In Paris he was engaged as violin soloist at the Concerts Spirituels and subsequently made several tours. He lived in Hamburg (1801-15), and then succeeded Spohr as Court kapellmeister at Gotha. He wrote eight operas which are unimportant, and many violin concertos, symphonies, and string quartets, several of them of great excellence, but is most famous for his choral and solo works with orchestra, of which the best known are those set to Schiller's poems, as "Die Götter," "Die Kindesmörderin," and "Mondlog der Jungfrau von Orléans."

ROMBLÓN, röm'blón'. A group of islands forming a separate province of the Philippine Islands. The group belongs to the Visayas and

is situated in the centre of the Visayan Sea east of Mindoro and north of Panay (Map: Philippine Islands, G 7). The principal islands with their areas in square miles are Tablas (320) in the west, Sibuyan (90) in the east, and Romblon (54) in the centre; the total area of the province is 515 square miles. The islands are highly mountainous, with a number of peaks over 2000 feet high in Tablas, while the peak of Sibuyan has a height of 6424 feet. The greater portions are covered with forests containing valuable woods, but wholly unexploited, except that a little gum mastic and copra are exported from the island of Romblon. Cattle are also raised and exported from the latter island, but throughout the province agriculture and other industries are engaged in only to supply the absolute necessities of home consumption. The population in 1901 was 55,339, mostly Visayans, with a few hundred savage Negritos in the interior of Tablas. The capital of the province is Romblon, with a well-sheltered harbor and a population of 6764.

ROME (Lat., *It. Roma*, Gk. *Ῥώμη*, *Rōmē*, connected with Olat. *roumen*, river Gk. *ῤῆναι*, *rhēnā*, Skt. *śru*, to flow), MODERN. The capital of the Kingdom of Italy and of the Province of Rome, the third largest city in the country. The city lies on the plain on each side of the winding Tiber, and in part on the slopes of the historic Seven Hills (Map: Italy, G 6). Its geographical position at the observatory of the Collegio Romano is latitude 41° 53' 52" N., longitude 12° 28' 40" E. Its situation in the Campagna, about 14 miles from the Apennines on the east, and the same distance from the Mediterranean on the west, is naturally unfavorable to health, but Rome is now considered one of the most sanitary cities in Europe, owing to extensive modern betterments of every description. The death rate fell from 30 per 1000 in 1876 to 26 in 1885, and to less than 18 later. The climate is less extreme than in Florence and Milan, the thermometer seldom rising above 99° F. or falling below 23°. The mean temperature in January is 44°, in July 77°.

Modern Rome, situated on the many-bridged Tiber, and dignified by its many and historic gates, is distinguished by its vast ruins, its remains of ancient walls, its numberless public statues and monuments both new and old, its fountains, and the magnificent improvements which have been made since Italy became a united kingdom. The Tiber has been inclosed in vast embankments of masonry, streets have been widened, filthy districts done away with, and pleasure grounds laid out. The Palatine Hill is now a public park; the Janiculum has been converted into drives and walks; and the Villa Borghese (q.v.) and gardens have been acquired for the metropolis. The historic present wall of the city is for the most part that of Aurelian, dating mainly from about 275. Rome is fortified by a wide circle of detached forts. The circumference of the city is about 15 miles. There are 10 bridges, three of which are for the most part ancient. Of these the five-arched Sant' Angelo is the best known. Many handsome modern public edifices have been erected.

Rome may be described as consisting of four sections or districts: The Campus Martius, the ancient southern portion, the more modern city on the northeast and east, and the district on

the right bank. Medieval Rome grew up not on the Seven Hills, but on the site of the old Campus Martius and across the Tiber around Saint Peter's and the Vatican; and these two districts remain to-day the most densely settled parts of the city. By far the larger of the two, the Campus Martius, occupies all the plain between the walls of Aurelian, the Pincio, Quirinal, and Capitoline hills, and the river. At its northern extremity, where the Porta del Popolo opens through the walls, is the handsome Piazza del Popolo, in the centre of which stands an Egyptian obelisk brought to Rome by Augustus Caesar from the Temple of the Sun at Heliopolis. The noteworthy Santa Maria del Popolo Church adjoins this Piazza. It was rebuilt at the close of the fifteenth century, and contains many frescoes by Pinturicchio. The Campus Martius district is practically bordered on the west for the most part by the important and historic Corso, which branches out from the Piazza del Popolo and runs south-southeast for about a mile to the Piazza di Venezia near the foot of the Capitoline Hill. It is lined with splendid palaces, churches, ancient and modern, and fine shops, Baroque architecture being in evidence.

The Piazza Venezia takes its name from the adjacent Palazzo di Venezia, a fine Florentine structure of the fifteenth century, built of stones from the Colosseum. In this part of the city the Italian Senate and Chamber of Deputies hold their sessions, and here are found also various Government offices and the University of Rome. The celebrated Pantheon (q.v.), which has always been important in the city's history, is the only ancient building in Rome still practically complete. The splendid Piazza Colonna on the Corso is to the northeast of the Pantheon, and is the centre of modern Roman life. In it rises the fine ancient column of Marcus Aurelius, 95 feet high. Not far away from the square is the elegant Sciarra-Colonna Palace, scarcely surpassed even in Rome. It dates from the early part of the seventeenth century. Two historic piles in the vicinity are the Palace Torlonia and the Palace Bonaparte, where the mother of Napoleon lived and died. Near by is the superb Palace Doria, with its noteworthy collection of paintings. To the east is the equally well-known Colonna Palace, dating from the commencement of the fifteenth century, with a small but good picture gallery having some of the finest landscapes of Poussin. Some distance northwest, near the Tiber, stands the Palace Borghese, with a splendid colonnaded court. To the southwest of this palace is the noteworthy Sant' Agostino Church, dating from 1479, the first church in Rome with a dome. Just southeast of the Pantheon is the Santa Maria sopra Minerva Church, begun in 1285 and fully renovated in recent times. It contains Michelangelo's sublime "Christ and the Cross." West of the Pantheon is the interesting Piazza Navona, with 3 fountains. Near it rises the Santa Maria della Pace Church, due to Sixtus IV. (1484). In one of its chapels are the far-famed Sibyls of Raphael, painted in 1514. Bramante built the fine cloisters. In the district south of the Pantheon is the Gesù, the sumptuous church of the Jesuits, begun in 1568. West of it stands the interesting Sant' Andrea della Valle, dating from 1591. Still farther west rises the imposing Renaissance Palace della Cancelleria, finished in 1495. Its arched court is of much interest. Just

south is a business centre—the Piazza Campo di Fiore, with a fine bronze statue of Bruno, erected in 1889 on the spot where he was burned. To the east stood the Theatre of Pompey, where Cæsar was assassinated. Southwest near the Tiber is the splendid Farnese Palace, completed in 1545. It was constructed, in part, by Michelangelo. Some distance to the east is situated the Piazza Tartaruga, containing the elegant bronze Fountain of the Tortoises, dating from 1585. In this vicinity was also the Ghetto after 1556—a congeries of mean alleys where the Jews were herded together by law under the Papacy. Here also is found the Cecci-Bolognetti Palace, where dwelt the sad-famed Beatrice. Near by is the noteworthy Porticus of Octavia, dating originally from the time of Augustus.

The southern part of the modern city formed the site of ancient Rome. Here are the Palatine, Aventine, and Cælian hills, now covered with celebrated ruins, also parks, gardens, vineyards, and orchards, besides churches and convents. All the region is sparsely inhabited. The top of the Capitoline Hill, approached from the Campus Martius by magnificent staircases at the foot of which Rienzi was slain, is one of the most impressive spots in Rome. The majestic square of the Capitol was planned by Michelangelo. Among its minor objects of interest are: an ancient group of the horse-taming Dioscuri; the celebrated bronze equestrian statue of Marcus Aurelius; and the first milestone of the old Appian Way. The Santa Maria in Arauceli Church, here, contains a famous Holy Child (Bambino). On the north end of the Capitol is seen the elaborate new monument of Victor Emmanuel II. The Palace of the Conservatori (on the Capitoline) contains the New Capitoline Museum. Here are preserved, among antiquities and pictures, many worthy ancient sculptures. Here, too, is to be seen the far-famed Capitoline wolf, probably the one that was struck by lightning (B.C. 65) in the temple. The Capitoline Museum of sculpture is also here. The Palace of the Senators, where is housed the civic administration of the city, has features by Michelangelo. This was the site of the ancient Tabularium. The Tarpeian Rock is on the southeast side of the Capitoline Hill, to the east-southeast of which extends the long site rich with the ruins of the Roman Forum, Colosseum, etc. On the south of the Forum rises the Palatine Hill. The impressive ruins, threaded by the pavement of the ancient Sacra Via, consist mostly of surface constructions. Of the isolated columns standing, those of the temple of Castor and Pollux are the most beautiful. The only construction here remaining practically in perfect condition is the Arch of Septimius Severus, dating from A.D. 203. Farther on toward the Colosseum rise three vast and impressive arches of the ancient Basilica of Constantine, constructed in his period. To the southeast stands the fine Arch of Titus, with reliefs, dedicated A.D. 81. East of the Arch at some little distance away rises the ruin of the magnificent Colosseum. (See AMPHITHEATRE.) It stands in the ancient gardens of Nero's Golden House. Its effect by moonlight and under artificial light is exceptionally grand. Southwest is the splendid Triumphal Arch of Constantine, constructed in 312.

North of the Roman Forum were the magnificent fora of the emperors, scant remains of which now exist. Part of the old Mamertine prison,

where Jugurtha and Verres met their death, is still to be seen under a church in the vicinity. The finest of these fora was the superb Forum of Trajan, unequalled for splendor. In its northwestern part rises the magnificent marble Trajan's Column, with a total height of about 150 feet. Its reliefs contain 2500 human figures. A statue of Saint Peter rises on the summit. Trajan was buried underneath the column.

On the Palatine Hill are the vast ruined surface constructions and substructures of the palaces of the emperors. This was the site of the Roma Quadrata, parts of whose walls are still to be seen. The excavations here, as in the town, have been very extensive and costly. The chief ruins seen on the hill are those of the Palace of Tiberius; the House of Livia, the wife of Augustus, with unexcavated frescoes, and altogether a most interesting edifice, being a complete Roman house; the mighty Palace of Augustus; the Stadium; and the Palæogeum, or school for the slaves of the emperors. At the western foot of the Palatine is the fine Janus Quadrifrons, a four-faced arched passage. Under this district passes the great ancient Cloaca Maxima (q.v.) from the Forum. It still discharges into the Tiber near by. In the proximity of this emptying point is an attractive little marble circular temple, with 20 Corinthian columns. Close by is another interesting and ancient temple, Rome in style, now the Church of Santa Maria Egiziaca. To the southeast and along the southwestern foot of the Palatine Hill formerly stretched the immense Circus Maximus. Only its surface construction remains to view.

The adjoining Aventine district in Southern Rome is now covered with monastic institutions and picturesque old gardens. Of the three churches on the crown of the Aventine the Santa Sabina is of the most importance. It dates from A.D. 425, and was the headquarters of Saint Dominic and his brotherhood. Near by is to be had the famous peep-hole view of the dome of Saint Peter. Some distance to the southwest from the Aventine Hill, and in a bend of the Tiber, rises Monte Testaccio, a solitary mound 115 feet high. It is said to have been formed of broken earthen jars, which came chiefly from Africa and were unpacked in the vicinity. To the east and in the vicinity is the well-known Protestant cemetery of Rome, a fine spot with noble trees. Here are buried Shelley, Keats, Frahmney, J. A. Symonds, and John Gibson. Not far away is the ancient Pyramid of Costus, the tomb of the Praetor Costius Epulo. It is 116 feet high, and is inclosed with marble slabs. In the section of the city southeast of the Palatine extends the ancient Via Appia, now transformed into a modern street. Along the route the huge ruins of the Baths of Caracalla (q.v.) are soon reached. Farther along are to be seen various old Roman tombs, and other burial, highly interesting as showing ancient burial customs. Especially so is the Columbarium of the Freedmen of Octavia, Nero's, etc., with its niches and stucco decorations and colors. North of this region and east-southeast of the Palatine is the district of the Cælian Hill, with its various churches and religious associations, which date from the time of the Apostles. At its western foot is the San Gregorio Magno Church, noted for its rôle in the lives of Saint Gregory and Saint Augustine. In the vicinity is the little Church of Santi Giovanni e Paolo, dating from

400, and restored in the last half of the nineteenth century. Portions of the early edifices here are worthy of study.

The district north of the Colosseum and radiating east from the Colosseum is that of San Clemente and the Lateran. The former basilica, just to the east of the amphitheatre, is of interesting antiquity and handsomely preserved. Underneath are the remains of the original church, dating from the fourth century. This lower church was large and its frescoes are of value. The upper church is also striking. The extensive Saint John in Laterano basilica, with its square and approaches, is very impressive. In the centre of the square stands a red obelisk from Thebes—the largest obelisk in Europe. On the left is the Lateran Museum, occupying the former residential palace of the popes. Opposite the Museum and across the square is the baptistery, the first one in Rome. The interior is decorated with mosaics and frescoes. In the interior of the church itself may be observed an admirable Gothic canopy and mosaics by J. Torriti. The cloisters of the thirteenth century are fine. Just to the northeast of the Lateran is the edifice which contains the well-known Scala Santa and the former chapel of the popes. (See LATERAN, CHURCH OF SAINT JOHN.) The most modern region of Rome, lying northeast and east of the Campus Martius and beyond the Corso, covers the slopes and plateaux of the Pincian, Quirinal, Viminal, and Esquiline hills. Here the city presents the usual appearance of a Continental metropolis. East of and adjoining the Piazza del Popolo rises the beautiful, garden-covered Pincio—the fashionable place for driving in the afternoon. The gardens of Lucullus were here. The grounds are everywhere embellished with statues, etc. The view over Rome is fine. Here is situated the Villa Medici, dating from 1540, in which the French Academy of Art has been housed since 1801. The Piazza di Spagna, the centre of the foreign life in Rome and of the artists' quarter, is near by. To it descends the imposing Scala di Spagna (1725) in 137 steps. Near the royal palace, situated to the southeast, is the grand Fontana Trevi, the most famous fountain in Rome. It dates from 1762. Northeast of the palace is the Piazza Barberini, with Bernini's fine fountain of the Tritons. The Barberini Palace (q.v.) is adjacent. Farther to the northeast stands the Palazzo Piombino, with the Boncompagni Museum of antiques, including the famous Head of Juno—Juno Ludovisi—and other fine examples. This vicinity was occupied by the gardens of Sallust. The neighboring Quirinal Palace, the abode of the King, belongs to the last part of the sixteenth century. Directly south is the interesting Rospigliosi Palace, dating from 1603. In its adjoining casino is the famous "Aurora" of Guido Reni—a ceiling painting.

A long street follows the top of the Quirinal ridge from Monte Cavallo, the square in front of the royal palace (so called from the colossal ancient statues of Castor and Pollux with their horses, Cavalli, that stand here—magnificent specimens), northeast to the Porta Pia in the city walls. This street is called Via del Quirinale in its lower part, then Via Venti Settembre. On it are the Ministries of War and Finance. South of this street and running parallel with it is the Via Nazionale—the most important street of the modern city. All this handsome new region, in

fact, is traversed by straight magnificent avenues reaching in all directions. Near its centre are the vast Baths of Diocletian (q.v.), where is located the Santa Maria degli Angeli Church. Southwest is the magnificent modern building of the National Gallery of Modern Art, to the southeast of which stands the Santa Pudenziana, said to be the oldest church in Rome. In the vicinity rises, in a spacious square, the imposing Santa Maria Maggiore (q.v.). To the south of it lay the gardens of Maecenas, and not far away may be seen remains of the Servian Wall. Quite a distance to the east is the noteworthy pilgrimage church San Lorenzo fuori le Mura, rebuilt in 578. Just south of the Maria Maggiore is the very early Santa Prassede. It was last restored in 1869. To the southwest is San Pietro in Vincoli, founded in the middle of the fifth century, and containing Michelangelo's celebrated Moses. Among the well-known villas in northeastern Rome the Borghese, with its art collections and beautiful grounds, is justly the most famous. The villa dates from the early part of the seventeenth century. The grounds are enriched with statues, fountains, miniature temples, etc. The splendid collections include Titian's far-famed "Sacred and Profane Love."

That part of the modern city of Rome which lies on the right or western bank of the Tiber may be divided into three parts—the Vatican quarter, otherwise called il Borgo, the Trastevere proper, and the Prati di Castello. The Borgo, or Leonine city, inclosed in a wall of its own, extends between Saint Peter's and Sant' Angelo. Sant' Angelo rises at the north end of the bridge of Sant' Angelo, which crosses the Tiber near the western end of the Campus Martius. The Prati lies to the north, and is a modern quarter, largely of apartment houses, uninteresting and ugly. The circular Castle of Sant' Angelo, as the great Sepulchre of Hadrian is called, is surrounded with ramparts, moats, and bastions, mounted with cannon, and is used as the citadel of Rome. It was erected A.D. 136. It is both imposing and picturesque, and has for some fifteen centuries been regarded as the fortress of Rome, figuring prominently in all the mediæval warfare of the city. Its height is 160 feet. When it was in the hands of the popes they connected it with the Vatican by an underground passage. Certain of the apartments are decorated, and the visitor is shown where Cellini and Beatrice Cenci were imprisoned. On the way to the Vatican stands the fine Girand Palace, dating from 1503. The district of the Borgo has been more or less closely associated with Papal history from the beginning of the sixth century, but is not in itself very interesting. Immediately to the west, on the slopes of the Monte Vaticano, loom the vast and magnificent establishments of Saint Peter's and the Vatican. See the articles SAINT PETER'S CHURCH and VATICAN.

South of Saint Peter's and along the Tiber and the Janiculum (q.v.) range of hills extends the Trastevere—that distinct district of Rome where the handsome work-people claim direct descent from the ancient Romans. It is connected with the Saint Peter's district by the Via della Lungara, which runs close to the river, and by the Strata della Mura along the heights. In the monastery of Sant' Onofrio, in the northern part of the Trastevere, Tasso lived for a time and died. Farther on and near the right is the magnificent

Villa Farnesina with its gardens. It has decorations designed by Raphael and executed by Giulio Romano and others. Twelve of these decorations form the Myth of Psyche of rarest value. The villa also contains Raphael's unsurpassed Galatea, executed by himself. Opposite, on the west, is the Palace Corsini with fine gardens. Near by is the Museum Torlonia with a vast collection of antiquities. Some distance southeast of the Museum Torlonia, and on the elevation, is the well-known Church of Santa Maria in Trastevere, alleged to have been founded under Alexander Severus. It has been restored in later times. Farther on to the southeast is the noteworthy Santa Cecilia in Trastevere, where the home of the saint was, and where now her remains lie. From the top of the Janiculum, along which run fine drives, especially the beautiful modern Passeggiata Margherita through the former gardens of the Palace Corsini, may be had splendid views of Rome. Especially in the late afternoon, when the sun is casting its waning glow over the Imperial city below, is the scene marvelous—the countless domes, towers, colossal piles, and vast ruins—all set off by the magnificent line of the Alban Mountains, usually snow-capped, in the distant background. On the Janiculum, and west of the Trastevere Church, is the Church of San Pietro in Montorio, marking the place where it is claimed Saint Peter was martyred. In the grounds of its monastery is a little round Doric tempietto, a fine example designed by Bramante. It is situated on the precise spot where Saint Peter's cross is supposed to have stood. The superb view over Rome from the piazza of this church is the usual one enjoyed on the Janiculum by tourists. Some distance to the west is the fine Villa Doria Pamphili, with large and delightful grounds.

Rome is not important as an industrial and commercial centre. The art manufactures are, however, prominent, and consist in part of bronzes, terra-cottas, mosaics, cameos, artificial pearls, and church ornaments. Other manufactures are leather, silk, umbrellas and parasols, strings for musical instruments, artificial flowers, candles, soap, flour, macaroni, fertilizers, and glue. A flourishing industry is the making of copies of famous paintings. In the Vatican is the Papal manufactory of mosaic, where copies of famous pictures are executed in colored glass for churches and other religious institutions. The Government has a large tobacco factory in Rome. The largest imports are grains, cattle, and wine. The Tiber is canalized in the city, but its port only suffices for small river craft.

Rome is the seat of the Italian Government and of the Pope and the College of Cardinals. The head of the municipal government is the syndic or mayor. He is chosen by the 80 members of the municipal council, who are themselves elected by the people. The giunta is an administrative body, consisting of the mayor and 10 members (assessori), who preside over the departmental committees. For purposes of administration the city is divided into 15 districts. It forms five parliamentary circles. In 1902 the budget balanced at about \$6,500,000. The debt of the city in 1903 was some \$43,900,000. The streets are lighted principally by electricity. There are electric street railways and a fire department. There are also municipal markets and baths, and a municipal slaughter house,

bakery, cemetery, crematory, and pawn shop. Rome is unequalled perhaps for its fine and abundant water supply, which is conducted from the mountains into the city by four great conduits, which empty, in part, the half-curved aqueducts of old Rome, that stalk so majestically across the Campagna. The building regulations of Rome, adopted in 1887, are exceedingly strict. They make ample provision for light and air and have had a marked effect upon the kind of tenement and other houses erected. They forbid the destruction, even by the owners, of buildings of historic or artistic interest, but encourage the tearing down of other antiquated dwellings. The desire of the Government not to sacrifice the monuments of antiquity was clearly shown by the project to acquire and set apart as an archaeological park, the district containing the Forum, the Colosseum, the Forum of Trajan, the Baths of Titus, the Circus Maximus, the temples of Vesta and of Fortuna, and the remains of the palaces of the Caesars on the Palatine.

The interesting features in the environs (see *CAMPAGNA DI ROMA*) not already mentioned are: The Villa Albani, on the northeast, with an interesting art collection, including some well-known examples; farther on, the Sant' Agnese fuori le Mura Church, built over the tomb of the saint, and restored in 1856; the various Catacombs (q.v.); the Appian Way (q.v.), on which is the Domine quo Vadis (q.v.) Church, southeast of the city; farther on, the interesting Circus of Maxentius and the well-known tomb of Cecilia Metella (q.v.); and the San Paolo fuori le Mura Church, south of the city. This church was called the most attractive one in Rome before the fire of 1823. It has been rebuilt in splendid style, with a particularly gorgeous interior. It contains a series of portrait medallions of all the popes. The cloisters are also fine.

Under the monarchy the Roman educational system has been thoroughly reorganized. Besides the University (see *ROMAN UNIVERSITY*) etc., there are the College of the Propaganda, founded in 1627, with theological and philosophical faculties; the Pontificia Accademia dei Nobili Ecclesiastici, for the preparation for administrative and diplomatic careers; the Collegio Germanico Ungarico; the Jesuit Collegio Romano; a Collegio Rabbinico; an Institute Talmud Torà; a Collegium Bohemicum; two Collegii Teutonici; a Conservatory of Music; a School of Architecture and the Plastic Arts; four municipal licea; four public gymnasi, etc. Among the numerous academies and art and science institutes and associations are the Accademia degli Arcadi; the Royal Academy of Sciences; the Società di Belle Arti. Nearly all the leading countries are represented by schools, including the American Schools of Architecture and of Classical Studies. The botanic garden is of some interest.

The museums of Rome are vast and invaluable, especially the art and archaeological collections. They have been in part noted above in *General Description*. (For the Vatican collections, see *VATICAN*; for the Capitoline collection, see *CAPITOLINE MUSEUM*.) The Capitoline Museum contains the beautiful Capitoline Venus and the famous mosaic (Pliny's Doves on a Fountain Basin, brought from Hadrian's Villa. The museum of the Lateran possesses the fine portrait statue of Sophocles, discovered in 1838. Among

the masterpieces in the National Roman Museum of Antiquities are a statue of Hera and a marble statue of a Kneeling Youth—the latter an original Greek work. The National Corsini Gallery, with engravings and drawings, is likewise meritorious. The Collegio Romano contains the important Museo Kircheriano, founded in 1601, with its extensive pre-historic and ethnographical collections. Here is preserved the treasure of Praeneste—gold, silver, and other objects discovered in a tomb in 1876.

Rome is rich in libraries. Among the important collections are the Biblioteca Nazionale Centrale Vittorio Emmanuele, with about 340,000 volumes; the great Vatican library, containing 250,000 volumes and 26,000 manuscripts; the excellent medical Biblioteca Lancisiana; the library in the Corsini Palace, with about 70,000 volumes; the library in the Barberini Palace; the Government's Biblioteca Casanatense (182,000 volumes); the Biblioteca Angelica (150,000 volumes). The valuable national archives are housed in the cloisters of the Santa Maria di Campo Marzio. Except Milan, Rome is the most important city in Italy for music and the drama.

The charitable activities, both civic and Catholic, are on a large scale. The 300 organizations under the control of the Board of Charities have property to the value of some \$20,000,000. Of these organizations 150 give *dots* to marriageable young women, 11 have other special aims, 55 dispense general charity, the rest are hospitals and asylums. Near the Lateran is an important hospital for women, with an obstetrical clinic. The large hospital of San Michele has a Government working school for children.

Popular festivals of interest are the carnival from the second Sunday before Ash Wednesday to Shrove Tuesday, the October festival in the vintage season, the national festival of the Constitution on the first Sunday in June, and the anniversary of the foundation of Rome on April 21.

The population of Rome in 1881 was 300,467; in 1901, 462,783.

ANCIENT ROME. The first of the ancient city settlements was upon the Palatine Hill (*mons Palatinus* or *Palatium*), an isolated summit, rising only about 140 feet above the level of the Tiber, and at that time flanked on two sides by marshy pools connected with that river. This first settlement was called *Roma Quadrata*, being laid out four-square, after the Etruscan rite. The next noteworthy stage in the topographical and political development of the city was that of the inclusion of the neighboring hills (*montes*), Caelius and Esquilinus, within the city limits, and the organization of the territory as 'seven hill districts' (the *Septimontium*—not to be confused with the so-called 'seven hills of Rome' of later days). Three of the seven districts were connected with the Palatine—Palatium, Cermalus (the western corner and slope of the Palatine), and Velia (the outlying ridge running northward toward the Esquiline). Three were connected with the Esquiline—Cispinus (its northern summit), Oppius (its southern summit), and Fagutal (a western shoulder of Oppius). The seventh district was the Sucusca on the Caelian Hill, whose especial duty it was to lend its aid against attacks by the people of Gabii, who dwelt a few miles eastward from Rome. Later a body of Sabines pushed southward from

their hill dwellings, seized a well-defended position on the Quirinal Hill, and had more or less fighting with their Latin neighbors of the Septimontium until a coalition was finally effected and the heights of the Quirinal and Viminal hills, with the Sabine settlers, were incorporated within the city, which was now organized into four 'regions': (1) *Regio Sucusca* (later called *Regio Suburana*), which included the Caelian Hill, with the valley and rising ground north-westward around the Cispinus, as well as the valley (*Subura*) between the *montes* and *colles*; (2) *Regio Esquilina*, including substantially the three Esquiline districts of the *Septimontium*; (3) *Regio Collina*, including the two Sabine *colles*, Quirinal and Viminal; and finally (4) *Regio Palatina*, including the three Palatine districts of the *Septimontium*. Moreover, another *mons*, the Capitoline, at that time joined by a ridge to the Quirinal, but lying near the Tiber, just across the inlet of the Velabrum from the Palatine, was taken as the common citadel of the community and a common temple to Jupiter built upon it, while the valley between the Capitoline and the north corner of the Palatine, just free from the Velabrum inlet at low water, but crossed by a brook, with a number of tributary springs, that rose in the Subura, and subject for centuries (and even now) to frequent inundations from the rising Tiber, was gradually drained and made the common marketplace (*Forum*) of the community, and the meeting-place of its courts and legislative assemblies. King Servius Tullius was said to have added to the city of the Four Regions a triangular strip of plain behind the Esquiline and to have built a wall which included not only the Four Regions, with the Capitol and Forum, and the new addition to the Esquiline, but also another hill (*mons*), the Aventine, lying to the south and west of the Palatine and close to the Tiber. But this hill remained for centuries outside the formal city limits (*pomerium*), the advancement of which from these really pre-historic times did not keep progress with the growth of the actual settlement. About this time also a wooden bridge supported on piles was thrown across the Tiber from the open space (*Forum Boarium*) between Capitol, Palatine, and Aventine, and a fort constructed on the height of Mons Janiculus on the right bank, whence a constant watch was kept for warlike movements on the part of Rome's enemies, especially the Etruscans.

Although the *pomerium* was not extended, Rome went on adding new territory in the neighborhood to her domain, and its organization as 'regions' was replaced by an organization as 'tribes,' of which the first four, the 'city tribes,' were simply the old 'Four Regions.' To these new 'country tribes' were gradually added until the number of 35 was reached. But these tribes finally lost their territorial character and became mere voting classes, to one or the other of which each new Roman citizen was assigned. The population of the city was probably much reduced by the Gallic invasion and the haphazard rebuilding of the city after its destruction by that enemy left it with those narrow and crooked streets that were its curse for many centuries. But with the cessation of hostilities in the immediate neighborhood the agricultural population of Rome spread far beyond its walls on both sides of the Tiber, which was now crossed by two new bridges

of stone besides the old pile bridge. By the end of the Republic the old Servian walls had been overrun in almost all directions and had even disappeared from view in great measure. The best opportunity for building was out on the *Campus Martius*, the 'parade ground,' which lay between the Quirinal and Capitol to the east and the great bend of the Tiber to the west. Accordingly that became the site both of many private residences and of great public buildings of various sorts. Augustus divided the city for administrative purposes into 14 numbered 'regions,' of which 13 were on the right bank and the fourteenth on the left, and this division continued for centuries after his day. But the external limits of his city are difficult, if not impossible, to determine. They, however, extended beyond the later walls of the city in some directions. The population of the city reached its maximum in the early Empire, though the oft-quoted estimate of 2,000,000 is undoubtedly much too great.

Rome had remained a defenseless city for centuries until the Emperor Aurelian (A.D. 270-275) began and Probus (A.D. 276-281) finished a line of massive fortifications, which, restored in 403 by Honorius and later by Belisarius and by a number of the popes, and added to on the right bank by Leo IV. (847-855) to include the great settlement around and near the Basilica of Saint Peter and the Vatican Palace, remain the present walls of Rome. The walls of Aurelian doubtless aimed to include as far as possible the actually inhabited city, but were curiously irregular in outline, being carried, where possible, along the edges of elevations for additional inaccessibility from the outside and also making use of older structures as far as possible. On the right bank, however, the fort on the Janiculum was connected with the Tiber by two lines of wall running northeast and southeast respectively to the nearest points of the river by about the shortest practicable route.

The internal commotions of Italy in the centuries immediately following and the devastation of the region by the barbarian invasions caused a great diminution in the number of Rome's inhabitants, and the cutting of the aqueducts led to the necessary abandonment of residences on the higher ground and to the massing of the people, poor and powerful alike, upon the ground near the Tiber. So the *Campus Martius* and the Trastevere opposite became the centre of population through the Middle Ages (and are still the most thickly settled portions of the city), while three-fourths of the city was given over to desolation and finally became the vineyards and gardens of the wealthy classes.

HISTORY OF ROME DURING THE EARLIEST OR REGAL PERIOD. According to the myth of Romulus (q.v.), Rome was an offshoot from Alba Longa, but the most rational view of the city's origin is that which is suggested by a consideration of its site. It derived its name from *rima*, an old word for river—the 'River City,' and it probably sprang into existence as a frontier defense against the Etruscans, and as an emporium for the river traffic of the country; but whether it was founded by a Latin confederacy or by an individual chief is beyond the reach of conjecture. The date fixed upon for the commencement of the city by the formation of the *Pomitorium*, April 21, 753 B.C., is perfectly valueless. The three 'tribes,' Ramnes, Tities, and Luceres,

which appear in the Roman legend as the constituent parts of the primitive commonwealth, suggest the idea that Rome arose out of an amalgamation of three separate cantons. The existence of a Sabine element, represented by the Tities, is indeed admitted, but its introduction is thrown back to a period long anterior to the foundation of the city, when the Roman clans were still living in their own villages, and nothing of Rome existed but its 'stronghold' on the Palatine. Nor is there anything to indicate that it materially affected the Latin character of the language, polity, or religion of the commonwealth which was subsequently formed.

The motives which probably led to the building of Rome also led to its rapid development. That the Palatine Hill was the oldest portion of the city is attested by a variety of ancient notices. Not only does it hold that rank in the Roman legend, but on it were situated the oldest civil and religious institutions. The Roman myth of the establishment of an asylum on the Capitoline (see CAPITOL) for bondsmen and once by slaves, with its sequel, the rape of the Sabine women, the wars with the Latins of Camina, Antenna, and Crustumium, and especially with the Sabines of Cures under their King Titus Tatius, and the tragic fate of Europa—is historically worthless; except, perhaps, so far as it shows us how from the beginning the Roman burghers were engaged in constant feuds with their neighbors for the aggrandizement of their power. The entire history of the 'regal period,' in fact, has come down to us in so mythical and legendary a form, that we cannot feel absolutely certain of the reality of a single incident. That such personages as Numa Pompilius, Tullus Hostilius, Ancus Martius, Lucius Tarquinius Priscus, Servius Tullius, and Lucius Tarquinius Superbus ever existed, or, if they did, that the circumstances of their lives, their institutions, their conquests, their reforms, were as the ancient narrative describes them, are things which no critical scholar can believe. The destruction of the city records by the Gauls, when they captured and burned Rome in the fourth century B.C., deprived the subsequent chroniclers of authentic information in regard to the past, and forced them to rely upon treacherous reminiscences, on oral tradition, on ballads, and on all the multitudinous fabrications of a patriotic fancy, that would naturally seek compensation for political disaster in the splendor with which it would invest its primeval history of the State.

From the very beginning of the city—and probably long before—the inhabitants were divided into two orders—exclusive of 'slaves,' bondsmen and their dependents, better known, perhaps, as 'patricians' and 'clients.' The former alone possessed political rights. It was they who exclusively constituted the *populus*—the 'people'; while the clients had no political existence whatever. That the clients formed a body essentially different from the *plebs* is not true, and seems based mainly on the mythical account of what followed the destruction of Alba Longa by Tullus Hostilius. The name *plebs* is doubtless of later origin than *clientes*; but both are applicable to the same persons. The constitution of the State was simple. All the burghers were politically on a footing of equality. From their own ranks was chosen the King (*rex*), who was therefor

nothing more than an ordinary burghess—a husbandman, a trader, a warrior, set over his fellows. The *rex* held his office for life; he consulted the national gods; he appointed the priests and priestesses; he called out the *populus* for war, and led the army in person; his command (*imperium*) was not to be gainsaid, on which account, on all official occasions, he was preceded by ‘messengers’ or ‘summoners’ bearing the ‘fasces’ (axes and rods tied up together), the symbols of power and punishment; he had the keys of the public chest, and he was supreme judge in all civil and criminal suits. The Roman religion or *cultus* was from the first thoroughly subordinate to the authority of the State; and all that we can infer from the myth of Numa is that Rome perhaps owed its colleges of augurs and pontiffs to the wisdom of some enlightened sovereign who felt himself at times embarrassed in his decisions on matters of religious and public law, and recognized how valuable might be the aid afforded him by a body of sacred experts. Originally the sole power was the regal, and the subordinate magistracies of later times arose from a delegation of regal authority, rendered necessary by the ceaseless increase of State business. On the other hand, we may believe that the *senatus*, or council of the elders, from its very nature, was as old an institution as the monarchy itself. They gave their advice when the *rex* chose to ask it; that was all. Yet, as the tenure of their office was for life, they necessarily possessed great moral authority. Then households formed a *gens* (a ‘clan’ or ‘family’); 10 clans, or 100 households, formed a *curia*, or wardship; and 10 wardships, or 100 clans, or 1000 households, formed the *populus, civitas*, or community. But as Rome comprised three cantons, the actual number of wards was 30, of clans 300, and of households 3000. Every household had to furnish one foot-soldier, and every clan a horseman and a senator. Each ward was under the care of a special warden (*curio*), had a priest of its own (the *flamen curialis*), and celebrated its own festivals. None but burghesses could bear arms in defense of the State. The original Roman army, or *legio*, was composed of three ‘hundreds’ (*centuriæ*) of horsemen, under their divisional leaders (*tribuni celerum*); and three ‘thousand’ of footmen, also under divisional leaders (*tribuni militum*), to whom were added a number of light-armed skirmishers (*velites*), especially ‘archers’ (*arquites*). The *rex* was usually the general, but as the cavalry force had a colonel of its own (*magister equitum*), it is probable that he placed himself at the head of the infantry.

The foreign policy of Rome seems to have been aggressive from the first, and this character it retained as long as the aggrandizement of the State was possible. We have, it is true, no certain knowledge of the primitive struggles, but it appears from the legends that at a very early period the neighboring Latin communities of Antenna, Crustumerium, Ficulnea, Medullia, Camina, Corniculum, Cameria, and Collatia were subjugated. The crisis of the Latin war, however, was undoubtedly the contest with Alba Longa, which was destroyed and yielded its leadership to the conqueror, its inhabitants being transferred to Rome, where they were ultimately incorporated with the Roman burghesses. The wars with the Etruscans of Fidenæ and Veii—assigned, like the destruction of Alba Longa, to the reign

of Tullus Hostilius—were apparently indecisive; those with the Rutuli and Volsci, however, were probably more fortunate; but uncertainty hangs like a thick mist over the ancient narrative. Even the story of the Tarquins, though it belongs to the later period of the monarchy, is in many of its details far from credible.

Meanwhile a great internal change had taken place in Rome. This is usually designated the Servian ‘reform of the constitution,’ although it was only a reform in the mode of raising the army. Originally, as we have seen, none but burghesses could bear arms in defense of the State; but the increase of the general population, caused partly by the annexation of the conquered Latin communities and partly by time, had totally altered the relation in which the non-burghesses, or *plebs*, originally stood to their political superiors.

The *plebs* could acquire property and wealth, and could bequeath it with the same legal right as the *populus*; moreover, such of the Latin settlers as were wealthy and distinguished in their own communities did not cease to be so when they were amalgamated with the Roman ‘multitude.’ It was therefore felt to be no longer judicious to let the military burdens fall exclusively upon the old burghesses while the rights of property were equally shared by the non-burghesses. Hence the new arrangement, known in Roman history as the formation of the *comitia centuriata*. When or with whom the change originated it is impossible to say. The legend assigns it to Servius Tullius, predecessor of Tarquin the Proud; and it was in all probability the work of some kingly ruler who saw the necessity of reorganizing the national forces. Its details were briefly as follows: Every Roman freeholder from the age of 17 to 60, whether patrician or plebeian, was made liable to serve in the army; but he took his place according to the amount of his property. The freeholders were distributed into five *classes*, and these *classes*, all of whom were infantry, were again subdivided into *centuriæ* (‘hundreds’). The first class, which required to possess property valued at 100,000 *asses* (‘units’), or an entire ‘hide’ of land (that is, as much as could be worked with one plow), furnished 82 ‘hundreds’; the second, property valued at 75,000 *asses* or $\frac{3}{4}$ of a ‘hide’ of land, furnished 20 ‘hundreds’; the third, property valued at 50,000 *asses*, or $\frac{1}{2}$ ‘hide’ of land, furnished 20 ‘hundreds’; the fourth, property valued at 25,000 *asses*, or $\frac{1}{4}$ ‘hide’ of land, furnished 20 ‘hundreds’; and the fifth, property valued at 12,500 *asses*, or $\frac{1}{8}$ ‘hide’ of land, furnished 32 ‘hundreds.’ These valuations in *asses* are given, it must be noted, by later writers in terms of their own period. There was no such wealth in private hands in Rome during the kingly period. A single ‘hundred’ was, moreover, added from the ranks of the non-freeholders, or *proletarii*, although it is possible that from the same order came the two ‘hundreds’ of ‘horn-blowers’ (*cornicines*) and ‘trumpeters’ (*tibicines*), attached to the fifth class. Thus the infantry ‘hundreds’ amounted to 175, that is 17,500 men, besides whom were 18 ‘hundreds’ of *equites* (‘horsemen’) chosen from the wealthiest burghesses and non-burghesses; so that the Roman army now numbered in all nearly 20,000 men. We have stated that the original design of this new arrangement was merely military, but it is easy to see that it would soon produce political results. Hence

the Servian military reform paved the way for the great political struggle between the patricians and the plebeians, which commenced with the first year of the Republic, and only terminated with its dissolution.

THE ROMAN REPUBLIC FROM ITS INSTITUTION TO THE ABOLITION OF THE DECEMVIRATE.—(I.) INTERNAL HISTORY. According to the legend, the expulsion of the Tarquins was brought about by Junius Brutus and Tarquinius Collatinus, in revenge for the outrage on the honor of Lucretia, and was followed by the abolition of the monarchy. The date usually assigned to this event is B.C. 509. The story may safely be taken as evidence that it was an unbridled lust of power and self-gratification that brought ruin on the Romano-Fuscan dynasty. Of course, we can make nothing definite out of the early years of the Republic. Dates and names, and even events, must go for very little. Valerius Publicola or Poplicola, Sp. Lucretius, M. Horatius, Lars Porcena (q.v.), of Clusium, Aulus Postumius, with the stories of Horatius Coeles and the battle of Lake Regillus, will not bear historical investigation. We must content ourselves with the knowledge of tendencies and general results. The change from 'kings' to 'consuls' was not intended to diminish the administrative power of the supreme rulers, but only to deprive them of the opportunity of doing harm; and this it effectually succeeded in doing, by limiting their tenure of office to a year, and by numerous other restrictions. (See CONST.) It is believed to have been about this time, and in consequence of the new political changes, that the old assessors of the King, such as the *questores partricidii*, formally became standing magistrates instead of mere honorary counselors, and also that the priesthood became a more self-governing and exclusive body. During the regal period the priests were appointed by the King, but now the colleges of augurs and pontiffs began to fill up the vacancies in their ranks themselves, while the vestals and separate *flamines* were nominated by the pontifical college, which chose a president (*pontifex maximus*) for the purpose. The opinions of the augurs and pontiffs became more and more legally binding. This is to be connected with the fact that in every possible way the patricians or old burghesses—now rapidly becoming a mere *noblesse*—were seeking to rise on the ruins of the monarchy and to preserve separate institutions for the benefit of their own order, when they could with difficulty longer exclude the *plebs* from participation in common civic privileges. In the details given us of the 'Servian reform' we can easily discern a spirit of compromise, the concessions made to the plebeians in the constitution and powers of the *comitia centuriata* being partially counterbalanced by the new powers conferred on the old burghess body, the *comitia curiata*—viz. the right of confirming or rejecting the measures passed in the lower assembly. The character of the senate altered under the action of the same influences. Although it never had been formally a patrician body—although admission to it under the kings was obtainable simply by the exercise of the royal prerogative, yet practically 299 out of the 300 senators had always been patricians; but after the institution of the Republic, we are told that the blanks in the senate were filled up *en masse* from the ranks

of the plebeians, so that of the 300 members less than half were *patres* ('full burghesses'), while 160 were *conscripti* (added to the roll), whence the official designation of the senators *patres et conscripti* ('full burghesses and enrolled').

As yet, however, it is to be observed, the plebeians were rigorously excluded from the magistracies. They could vote, but the same was not in the administration. None but patricians were eligible for the consulship, for the office of quaestor, or for any of the executive functions; and the priestly colleges rigidly closed their doors against the new burghesses. The struggle, therefore, between the two orders went on with ever-increasing violence. One point comes out very clearly from the narrative, that the establishment of the Republic and the reconstruction of the burghess body, instead of allaying discontent, only fostered it. Power virtually passed into the hands of the capitalists, and, though some of these were plebeians, yet they would seem to have preferred their personal money interests to the interests of their order, and to have cooperated with the patricians. The abuse by these capitalists of the *ager publicus*, the lands of a conquered people taken from them, annexed to the Roman State, and let out originally to the patricians at a fixed rent (see AGRICULTURE), together with the frightful severity of the law of debtor and creditor, the effect of which was all but to ruin the small plebeian farmers, who constituted perhaps the most numerous section of the burghesses, finally led to a great revolt of the plebs, known as the 'secession to the sacred hill,' the date assigned to which is B.C. 494. On that occasion the plebeian farmer soldiers, who had just returned from a campaign against the Volscians, marched in military order out of Rome, under their plebeian officers, to a mount near the confluence of the Anio with the Tiber, and threatened to found there a new city if the patricians did not grant them magistrates from their own order; the result was the institution of the famous plebeian tribunate, a sort of rival power to the patrician consulate. To the same period belong the *adles* (q.v.). A little later, the *comitia tributa* emerged into political prominence. This was really the same body of burghesses as formed the *comitia centuriata*, but with the important difference that the number of votes was not in proportion to a property classification. The poor plebeian was on a footing of equality with the rich patrician; each gave his vote, and nothing more. Hence, the *comitia tributa* virtually became a plebeian assembly, and when the *plebiscita* ('resolutions of the plebs' carried at these *comitia*) acquired, by the Aelian laws passed after the abolition of the decemvirate, a legally binding character, the victory of the 'minority' in the sphere of legislation was complete. From this time the term *populus* practically, though not formally, loses its exclusive significance; and when we speak of the Roman citizens, we mean indifferently patricians and plebeians. The semi-historical traditions of this period unmistakably show that the institution of the tribunate led to something very like a civil war between the two orders. Such is the real significance of the legends of Gaius Marcius, surnamed *Cornelius* (q.v.); the surprise of the Capitol by the Sabine marauder, Appius Herdonius, at the head of a motley force of political outlaws, refugees, and slaves; the migrations of numerous Roman bur-

gesses with their families to more peaceful communities; the street fights; the assassinations of plebeian magistrates; the annihilation by the Etruscans of the Fabian gens, who had left Rome to escape the vengeance of their order for having passed over to the side of the plebeians; and the atrocious judicial murder of Spurius Cassius, an eminent patrician, who had also incurred the deadly hatred of his order, by proposing an agrarian law that would have checked the pernicious prosperity of the capitalists and overgrown landholders. Finally, B.C. 462, a measure was brought forward by the tribune C. Terentilius Harsa, to appoint a commission of ten men to draw up a code of laws for the purpose of protecting the plebeians against the arbitrary decisions of the patrician magistrates. The ten years that followed were literally a period of organized anarchy in Rome. At length the nobles gave way, and the result was the drawing up of the famous code known as the *Twelve Tables*—at first *Ten*, to which two were afterward added—the appointment of the decemviri (q.v.), and the abolition of all the ordinary magistrates, both patrician and plebeian. The government by decemviri, however, lasted only two years; according to tradition, the occasion of its overthrow was the attempt of the principal decemvir, Appius Claudius (q.v.), to seize the daughter of Virginius, a Roman centurion; but the real cause was doubtless political, and the result was the restoration of the prædecemviral state of things—the patrician consulate and the plebeian tribunal.

(2) EXTERNAL HISTORY. The external history of Rome, from the establishment of the Republic to the abolition of the decemvirate, is purely military. Long before the close of the regal period the Romans had acquired the leadership of Latium, and in all the early wars of the Republic they were assisted by their allies and kinsmen, sometimes also by other nations—as, for example, the Hernicians, between whom and the Romans and Latins a league was formed by Spurius Cassius in the beginning of the fifth century B.C. The most important of these wars were those with the southern Etruscans, especially the Veientes, in which, however, the Romans were unsuccessful, and even suffered terrible disasters, of which the legend concerning the destruction of the Fabian gens on the Cremera (B.C. 477) may be taken as a distorted representation; the contemporaneous wars with the Volscians, in which Coriolanus is the most distinguished figure; and those with the Æqui, to which belongs the legend of Cincinnatus (q.v.).

FROM THE ABOLITION OF THE DECEMVRATE TO THE DEFEAT OF THE SAMNITES, AND THE SUBJUGATION OF ALL ITALY (B.C. 449-265)—(1) INTERNAL HISTORY. The leading political features of this period are the equalization of the two orders, and the growth of the new aristocracy of capitalists. After the abolition of the decemvirate, it would seem that the whole of the plebeian aristocracy, senators and capitalists, combined with the 'masses' of their order to make a series of grand attacks on the privileges of the old Roman noblesse. The struggle lasted for 100 years, and ended by the removal of all the social and political disabilities under which the plebeians had labored. First in B.C. 445, only four years after the fall of the decemvirs, was carried the *lex Canuleia*, by which it was enacted that marriage between a patrician and a plebeian should be le-

gally valid. At the same time a compromise was effected with respect to the consulship. Instead of two patrician consuls, it was agreed that the supreme power should be intrusted to new officers termed 'military tribunes with consular power,' who might be chosen equally from the patricians or plebeians. Ten years later (B.C. 435) the patricians tried to render the new office of less consequence by the transference of several of the functions hitherto exercised by consuls to two special patrician officers named *cesars* (q.v.). In B.C. 421 the quaestorship (see QUÆSTOR) was thrown open to the plebeians; in 368 the mastership of the horse; in 356, the dictatorship (see DICTATOR); in 351, the censorship; in 337, the prætorship (see PRÆTOR); and in 300, the pontifical and augural colleges.

The only effect of these political changes was to increase the power of the rich plebeians; and consequently, the social distress continued to show itself as before. Efforts were repeatedly made by individuals to remedy the evil, but without success. Such were the attempts of the tribunes Spurius Mæcius and Spurius Metilius (B.C. 417) to revive the agrarian law of Spurius Cassius; and of the patrician Marcus Manlius, who, though he had saved the Capitol during the Gallic siege, was hurled from the Tarpeian Rock (B.C. 384), on a trumped-up charge of aspiring to the monarchy; but at length (B.C. 367), after a struggle of eleven years, the Licinian rogations (see AGRARIAN LAW and LICINIAN ROGATIONS) were carried, by means of which it was hoped that an end had been put to the disastrous dissensions of the orders. Thus, at least, we interpret the act of the dictator Camillus, who erected a temple to the goddess Concordia, at the foot of the Capitol.

That these laws operated beneficially on the plebeian farmers or middle class of the Roman State is unquestionable; but events proved that they were inadequate to remedy the evil, and after a time they ceased to be strictly enforced. On the other hand, there can be as little doubt that, owing partly to these changes, and still more to the splendid and far-reaching conquests achieved in Italy during this period of internal strife by the Roman arms, the position of the plebeian farmer was decidedly raised. Not only was the treasury filled by the revenue drawn directly or indirectly from the subjugated lands, but the numerous colonies which Rome now began to send forth to secure her new acquisitions consisted entirely of the poorer plebeians, who always received a portion of the land in the district where they were settled. The long struggle between the two orders was thus virtually at an end; but the date usually assigned to the termination of the strife is B.C. 286, when the *lex Hortensia* was passed which confirmed the Publilian laws of 339, and definitely gave to the *plebiscita* passed the comitia of the tribes the full power of laws binding on the whole nation. Gradually, however, the importance of the popular assemblies declined, and that of the senate rose. This was owing mainly to the ever-increasing magnitude of the Roman State, and to the consequent necessity of a powerful governing body. The senate, which originally possessed no administrative power at all, now commenced to extend its functions, so that every matter of general importance—war, peace, alliances, the founding of colonies, the assignment of lands, building, the

whole system of finance—came under its supervision and authority.

(2) **EXTERNAL HISTORY.** The military successes of Rome during this period of internal strife were great. The irruption of the Gauls into sub-Apennine Italy (B.C. 391), though accompanied by frightful devastations, was barren of results, and did not materially affect the progress of Roman conquest. No doubt the battle on the Allia and the capture and burning of Rome (B.C. 390) were great disasters, but the injury was temporary. The vigilance of Camillus saved the Capitol, and the heroism of Camillus revived the courage and spirit of the citizens. Again and again in the course of the fourth century B.C. the Gallic hordes repeated their incursions into Central Italy, but never again returned victorious. In B.C. 367 Camillus defeated them at the Alban hills; in 360 they were routed at the Colline gate; in 358, by the dictator C. Sulpicius Peticius; and in 350, by Lucius Furius Camillus. Meanwhile, aided by their allies, the Latins and the Hernicans, the Romans carried on the long and desperate struggle with the Æquians, Volscians, and Etruscans. Finally, after repeated defeats, the Romans triumphed, and the fall of Veii (q.v.), B.C. 396, was really the death knell of Etruscan independence. Falerii, Capena, and Volturni—all sovereign cities of Etruria—hastened to make peace, and by the middle of the fourth century B.C. the whole of Southern Etruria had submitted to the supremacy of Rome, was kept in check by Roman garrisons, and denationalized by the influx of Roman colonists. In the land of the Volsci, likewise, a series of Roman fortresses were erected to overawe the native inhabitants; Velitra, on the borders of Latium, as far back as B.C. 492, Suesssa Pomestia (B.C. 442), Circeii (B.C. 393), Satrium (B.C. 385), and Setia (B.C. 382); besides, the whole Volscian district, known as the Pontine Marshes (q.v.), was distributed into farm allotments among the plebeian soldiery. Becoming alarmed, however, at the increasing power of Rome, the Latins and Hernicans withdrew from the league, and a severe and protracted struggle took place between them and their former ally. Nearly thirty years elapsed before the Romans succeeded in restoring the league of Spurius Cassius. In the course of this war the old Latin confederacy of the "thirty cities" was broken up (B.C. 384), probably as being dangerous to the hegemony of Rome, and their constitutions were more and more assimilated to the Roman. The terms of the treaty made by the Romans (B.C. 348) with the Carthaginians show how very dependent was the position of the Latin cities. Meanwhile, the Romans had pushed their garrisons as far south as the Liris, the northern boundary of Campania. Here they came into contact with the Samnites (q.v.).

The Samnites had long been extending their conquests in the south of Italy. Descending from their native mountains between the plains of Apulia and Campania, they had overrun the lower part of the peninsula, and had firmly established themselves in Lucania, Bruttium, Capua, and elsewhere. The forays of the Samnite highlanders in the rich lowlands of Campania were dreaded above all things by their polished but degenerate kinsmen of Capua, who had acquired the luxurious habits of the Greeks and Etruscans. It was really to save themselves

from these destructive forays that the Campanians offered to place themselves under the supremacy of Rome; and thus Romans and Samnites were thrown into a position of direct antagonism. The Samnite wars, of which three are reckoned, extended over 53 years (B.C. 343-290). The second, generally known as the "Great Samnite war," lasted 22 years (B.C. 326-304). At first the success was mainly on the side of the Samnites, and after the disaster at the Colline Forks (q.v.) it seemed as if Samnium was destined to become the ruler of Italy, but the military genius of the Roman consul, Quintus Fabius Rullianus (see Fabius), triumphed over every danger, and rendered all the heroism of Gaius Pontius, the Samnite leader, unavailing. In B.C. 304 Bovianum, the capital of Samnium, was stormed, and the highlanders were compelled to acknowledge the supremacy of the Republic. The third war (B.C. 298-290) was conducted with all the energy of despair; but though the Etruscans and Umbrians now joined the Samnites against the Romans, their help came too late. The victory of Rullianus and of P. Decius Mus, at Sentinum (B.C. 295), virtually ended the struggle, and placed the whole of the Italian peninsula at the mercy of the victor. At the close of the first Samnite war, which was quite indecisive, an insurrection had burst out among the Latins and Volscians, and spread over the whole territory of these two nations; but the defeat inflicted at Trifanum (B.C. 300) by the Roman consul, Titus Manlius Imperiosus Torquatus, almost instantly crushed it, and in two years the last spark of rebellion was extinguished. The Latin league was now dissolved; many of the towns lost their independence and became Roman *municipia*; new colonies were planted both on the coast and in the interior of the Latino-Volscian region; and finally so numerous were the farm allotments to Roman burgesses that two additional tribes had to be constituted.

The war with Pyrrhus (q.v.), King of Epirus, which led to the complete subjugation of peninsular Italy, is a sort of pendant to the great Samnite struggle. The Lucanians and Bruttians, who had aided the Romans in the Samnite wars, considering themselves cheated of their portion of the spoil, entered into negotiations with the enemies of their former associate throughout the peninsula. A coalition was immediately formed against Rome, consisting of Etruscans, Umbrians, and Gauls in the north, and of Lucanians, Bruttians, and Samnites in the south with a sort of tacit understanding on the part of the Tarentines that they would render assistance by and by. In the course of a single year the whole north was in arms, and once more the power and even the existence of Rome were in deadly peril. An entire Roman army of 13,000 men was annihilated at Arretium (B.C. 284) by the Senonian Gauls, but Publius Cornelius Dolabella marched into the country of the Senones at the head of a large force, and extirpated the whole nation. Shortly afterwards the overthrow of the Etrusco-Bolseian horde at Lake Vadimo (B.C. 283) shattered the northern confederacy, and left the Romans free to deal with their adversaries in the south. The Lucanians were quickly overpowered (B.C. 282); Samnium could do nothing. A rash and unprovoked attack on a small Roman fleet now brought down on the Tarentines the vengeance of Rome. Awaking to

a sense of their danger, the Tarantines invited Pyrrhus (q.v.) over from Epirus, and appointed him commander of their mercenaries. He arrived in Italy (B.C. 280) with a small army of his own, and a vague notion of founding an Hellenic empire in the West that should rival that created in the East by his kinsman, Alexander the Great. The varying fortunes of the struggle between Pyrrhus and the Romans, which lasted only five years, ended in his being obliged to return to Epirus without accomplishing anything.

After Pyrrhus, baffled in his attempts to check the progress of Rome, had withdrawn to Greece, the Lucanians and Samnites continued the unequal struggle, but in B.C. 269 the Samnites were utterly and definitely crushed. Tarentum had surrendered three years earlier; and now there was not a nation in Italy that did not acknowledge the supremacy of Rome. Distant Kingdoms began to feel that a new power had risen in the world; and Ptolemy Philadelphus, sovereign of Egypt, sent an embassy to Rome (B.C. 273), and concluded a treaty with the Republic. To secure their new acquisitions, the Romans established in the South military colonies at Paestum and Cosa, in Lucania (B.C. 273), at Beneventum (B.C. 268), and at Esernia (B.C. 263), to overawe the Samnites; and in the North, as outposts against the Gauls, Ariminum (B.C. 268), Firmum in Picenum (B.C. 264), and the burgess colony of Castrum Novum. Preparations were also made to carry the great Apian highway as far as Brundisium, on the Adriatic, and for the colonization of that city as a rival emporium to Tarentum.

The political changes were almost as important as the military. The whole population of peninsular Italy was divided into three classes—(1) *Cives Romani*, or such as enjoyed the full burgess privileges of Roman citizens; (2) *Nomen Latinum*—that is, such as possessed the same privileges as had been enjoyed by the members of the quondam Latin league—an equality with the Roman burgesses in matters of trade and inheritance, the privilege of self-government, but no participation in the Roman franchise, and consequently no power to modify the foreign policy of the State; (3) *Socii*, or 'allies,' to some of whom were conceded most liberal privileges, while others were governed in an almost despotic fashion. The *Cives Romani* no longer embraced merely the inhabitants of the old Roman community, the well-known 'tribes' (of whom there were now 33), but all the old burgess colonies planted in Etruria and Campania, besides such Sabine, Volscian, and other communities as had been received into the burgess body on account of their proved fidelity in times of trial, together with individual Roman emigrants or their families, scattered among the *municipia*, or living in villages by themselves. The cities possessing the *Nomen Latinum* included most of the 'colonies' sent out by Rome in later times, not only in Italy, but even beyond it; the members of which, if they had previously possessed the Roman franchise, voluntarily surrendered it in lieu of an allotment of land. But any 'Latin' burgess who had held a magistracy in his native town might return to Rome, be enrolled in one of the tribes, and vote like any other citizen. The *Socii* comprised all the rest of Italy, as the Hernicans, the Lucanians, Bruttians, the Greek cities, etc. All national or cantonal confederacies and alliances

among the Italians were broken up, and no means were left unemployed by the victors to prevent their restoration.

FROM THE OUTBREAK OF THE PUNIC WARS (B.C. 264) TO THE DESTRUCTION OF CARTHAGE (B.C. 146). At the time when Carthage (q.v.) came into collision with Rome she was indisputably the first maritime empire in the world, ruling as absolutely in the central and western Mediterranean seas as Rome in the Italian peninsula. Between the Carthaginians and the Romans there had long existed a nominal alliance—the oldest treaty dating as far back as the sixth century B.C. But this alliance had never possessed any real significance, and latterly the two nations had come to regard each other with considerable distrust. In B.C. 264 war was formally declared between the two nations on account of a trivial incident.

The wars with Carthage, known as the Punic Wars, were three in number. The first lasted 23 years (B.C. 264-241), and was waged mainly for the possession of Sicily. Its leading feature was the creation of a Roman navy, which finally wrested from Carthage the sovereignty of the seas. Rome, indeed, had never been a merely agricultural State, but events had hindered it from engaging to any large extent in maritime enterprise. The necessity for a navy now began to show itself. Not only was there a difficulty felt in transporting troops to Sicily, but the shores of the mainland were completely exposed to the ravages of Carthaginian squadrons. So energetically did the Senate set to work that (we are told) in 60 days from the time the trees were felled 120 ships were launched, and soon after the consul Gaius Duilius gained a brilliant success (B.C. 260) over the Carthaginians off Myla, on the northeast coast of Sicily. Subsequent events, however, were less favorable. An invasion of Africa by Regulus (q.v.) ended in disaster, and the war, which was henceforth confined to Sicily, languished miserably. Thrice the Roman navy was annihilated by storms at sea (B.C. 255, 253, and 249); and in spite of a series of unimportant successes by land, the Romans long found it impossible to make any impression on the Carthaginian strongholds of Lilybæum and Drepanum, mainly on account of the brilliant strategy with which they were held in check by Hamilcar Barca, the father of Hannibal. At last, however, a great sea fight took place off the Ægæan Isles (B.C. 241), in which a Roman fleet commanded by the consul Lutatius Catulus obtained a magnificent victory. The whole of Sicily, except the territory of Hiero of Syracuse, who had been a firm ally of the Romans, passed into the hands of the victors, who constituted it a Roman province and placed it under the government of a prætor. A lapse of 23 years occurred before the Second Punic War began, but during that interval neither Romans nor Carthaginians had been idle. The former had bullied their weak and exhausted rival into surrendering Sardinia and Corsica, which, like Sicily, were transformed into a Roman province. In addition, they had carried on a series of Gallic wars in Cisalpine Gaul (B.C. 231-222), the result of which was the complete humiliation of the barbarian Boii, Insubres, etc., and the extension of Italy to the Alps. On the eastern coast of the Adriatic also the Romans made their power felt by the vigor with which they suppressed Illyrian

piracy (B.C. 219). Meanwhile the descent of Hamilcar on the Spanish coast was followed, after some ineffectual opposition on the part of the natives, by the establishment of a new Carthaginian empire, or at least a protectorate in the west; and thus, almost before the Romans were aware of it, their rival had made good her losses and was even able to renew the struggle in a more daring fashion than before. How confident the bearing of the Carthaginians had now become may be seen from the fearless spirit in which they accepted the Roman challenge and entered on the Second Punic—or (as the Romans called it) the Hannibalic—war, the grand events of which were the crossing of the Alps by Hannibal, the terrible disasters of the Romans at Lake Trasimenus (B.C. 217) and Cannæ (B.C. 216), and the final overthrow of Hannibal at Zama (B.C. 202) by Scipio, which once more compelled the Carthaginians to sue for peace. In the Second Punic War the Spanish possessions of Carthage, like her Sicilian, passed to the Romans (who formed out of them the Provinces of Hispania Citerior and Hispania Ulterior); so did her protectorate over the Numidian sheiks. She was forced to surrender her whole navy (excepting 10 triremes) and all her elephants and solemnly to swear never to make war either in Africa or abroad, except with the consent of her vanquisher. The Imperial supremacy of Rome was now as unconditional in the western Mediterranean as on the mainland of Italy. Her relations, indeed, to the conquered Italian nationalities became much harsher than they had formerly been, for, after the first victories of Hannibal, these had risen against her. The Picentes, Brutii, Apulians, and Samnites were deprived either of the whole or the greater part of their lands; some communities were actually turned into serfs; the Greek cities in Lower Italy, most of which had also sided with Hannibal, became the seats of burgess colonies. But the loss of life and of vital prosperity was frightful. Slaves and desperadoes associated themselves in robber bands, but the exultation of victory closed the eyes and the ears of the Romans against every omen, and the perilous work of conquest and subjugation went on. During B.C. 201-196 the Celts in the valley of the Po, who had recommenced hostilities at the very moment Rome was freed from her embarrassment, were thoroughly subjugated; their territory was Latinized, but they themselves were declared incapable of ever acquiring Roman citizenship; and so rapidly did their nationality dissolve that when Polybius, only 30 years later, visited the country, nearly all traces of Celtic characteristics had disappeared. The Boii were finally subjugated about B.C. 193; the Ligurians were subdued B.C. 180-177, and the interior of Corsica and Sardinia about the same time. The wars in Spain were troublesome and of longer duration, but in the end the superior discipline of the legions always prevailed. So little reliance, however, could be placed on the Spanish submissions that the Romans felt it necessary to hold Spain by military occupation, and hence arose the first Roman standing armies. Forty thousand troops were maintained in the Spanish peninsula year after year. The most distinguished successes were those achieved by Scipio himself, by Quintus Minucius (B.C. 197-196), by Marcus Cato (B.C. 195), by Lucius Æmilius Paullus (B.C. 189), by

Gaius Calpurnius (B.C. 185), by Quintus Fulvius Flaccus (B.C. 181), and by Tiberius Gracchus (B.C. 179-178).

MACEDONIAN AND GREEK WARS. The causes that led to the interference of Rome in the politics of the East are too complicated to be given here, but the Macedonian wars were owing immediately to the alliance formed by Philip V. of Macedon with Hannibal after the battle of Cannæ. The Macedonian wars were three in number. The first (B.C. 214-205) was barren of results, mainly because the whole energy of Rome were directed to Spain and Lower Italy; but the second (B.C. 200-197) taught Philip that another and not to be trusted ally in Greece. The battle of Cynoscephalæ was followed by a treaty which compelled him to surrender his garrisons from the Greek cities, to surrender his fleet, and to pay 1000 talents toward the expenses of the war. Philip was thoroughly quelled, and during the remaining 18 years of his life he adhered to his Roman alliance. But the Ætolians, who had formed an alliance with Rome against Philip, quarreled with their allies, and persuaded Antiochus the Great (B.C. 191) of Syria to come to Thessaly (B.C. 192). He was overthrown by Scipio (Asiatienus) at Magnesia, in Asia Minor (B.C. 190), and obliged to surrender all his possessions in Europe and Asia Minor, all his elephants and ships, and to pay a heavy war indemnity. Next year the Ætolians were crushed, and a little later the quarrels between the Achæans and Spartans led to a general Roman protectorate over the whole of Greece.

Philip V. of Macedon was succeeded by Perses (B.C. 190), who resolved to try the fortune of war with the Romans, and in B.C. 172 the third, and last, Macedonian war began. It ended with the destruction of the Macedonian army at Pydna (B.C. 168) by the consul Lucius Æmilius Paullus (B.C. 168) and the dismemberment of the Macedonian Empire, which was broken up into four oligarchic republics. The Imperial Republic stopped Antiochus Epiphanes in his career of Egyptian conquest, ordered him instantly to abandon his acquisitions, and accepted the protectorate of Egypt in B.C. 168. Even the allies of Rome—the Pergamenes, the Rhodians, etc.—were treated with harshness and injustice. We may here, for the sake of connection, anticipate the course of history and mention the last Greek and Punic wars. Both of these came to an end in the same year (B.C. 146). The former was caused by an expiring outburst of pseudo-patriotism in the Æolian league and was virtually closed by the destruction of Corinth (B.C. 146) by the consul Mummius. The latter was not so much a war as a bloody sacrifice to Roman ambition. After Hannibal's death his party in Carthage seems to have recovered the ascendancy, and as the commercial prosperity of the city began to revive a bolder front was shown in resisting the encroachments of Masinissa, the Numidian ruler, whom the Roman senate protected and encouraged in his aggressions. In B.C. 146, after a siege of three years, Carthage was stormed by Scipio Africanus Minor and the Carthaginian Empire vanished forever from the earth.

POSITION OF ROME AT THE CLOSE OF THE PUNIC WARS, AND SKETCH OF ITS SUBSEQUENT SOCIAL CONDITION TO THE TERMINATION OF THE REPUBLIC. (B.C. 146-27). Simultaneously with the

enormous extension of power and authority in foreign lands, the national character underwent a complete and total alteration. The simplicity and stern integrity of life, the religious gravity of deportment, and the fidelity with which common civic and household duties were discharged, which in early times distinguished the Roman burgess, had now all but disappeared. The class of peasant proprietors who had laid the foundations of Roman greatness was either extinct or no longer what it once had been. The long and distant wars made it more and more impossible for the soldier to be a good citizen or a successful farmer. Indolence, inaptitude, and spendthrift habits aided the designs of the capitalists, and in most cases the paternal acres gradually slipped into the possession of the great landlords, who found it more profitable to turn them into pasture or cultivate them by gangs of slaves. The rise of the slave system—though an inevitable result of foreign conquest—was, indeed, the most horrible curse that ever fell on ancient Rome. If the Italian farmer strove to retain his small farm he was exposed to the competition of the capitalists, who shipped immense quantities of corn from Egypt and other granaries, where slave labor rendered its production cheap, and of course he failed in the unequal struggle. Not less pernicious was the change that passed over the character of the rich. As the old Roman patricians lost their exclusive privileges, the plebeians gradually acquired a full equality with them, and the germs of a new social aristocracy originated, based on wealth rather than pedigree, and comprising both plebeians and patricians. During the fourth and third centuries B.C. the political power of this order immensely increased. In fact, the whole government of the State passed into their hands. They became an oligarchy, and while it is not to be denied that they displayed extraordinary ability in the conduct of foreign affairs, selfishness, nepotism, and arrogance gradually became rampant. But far worse than even the selfishness and nepotism of the nobles was their ever-increasing luxury and immorality. When Rome had conquered Greece, and Syria, and Asia Minor, the days of her true greatness were ended. The wealth that poured into the State coffers, the treasures which victorious generals acquired, enabled them to gratify to the full the morbid appetites for pleasure engendered by exposure to the voluptuousness of the East. Such results were, it is true, not brought about in a day, nor without a resolute protest on the part of individual Romans. So long as Rome chose to subdue foreign nations and to hold them by the demoralizing tenure of conquest—i.e., as mere *provinces*, whose inhabitants, held in check by a fierce and unscrupulous soldiery, neither possessed political privileges nor dared cherish the hope of them—it was morally impossible for the citizens, either at home or abroad, to resume the simple and frugal habits of their forefathers. After Cato's time things grew worse instead of better, nor from this period down to the final dissolution of the Empire was a single radical reform ever permanently effected. The momentary success of Tiberius Gracchus and of his far abler brother, Gaius, in their attempts to prevent the social ruin of the State by redistributing the domain lands, breaking down the powers of the senate, reorganizing the administration, and partially restoring the legislative authority

of the popular assemblies, hardly survived their death; and the reaction that ensued proved that the senate could learn nothing from adversity, and that the rabble of the city were incapable of elevation or generosity of political sentiment. Henceforth the malversation of the public money by praetors and quaestors became chronic, and the moral debauchery of the mob of the capital by the largesses of ambitious politicians and the vile flattery of demagogues, complete. The old Roman faith, so deep, and strong, and stern, disappeared from the heart. The priests became hypocrites, the nobles 'philosophers' (i.e. unbelievers), their wives practicers of Oriental abominations under the name of 'mysteries,' while the poor looked on with unmeaning yet superstitious wonder at the hollow but pompous ceremonies of religion.

FROM THE DESTRUCTION OF CARTHAGE TO THE TERMINATION OF THE REPUBLIC (B.C. 146-27). We have already alluded to the wars waged in Spain during the first half of the second century B.C. The humane and conciliatory policy pursued toward the natives by Tiberius Sempronius Gracchus, father of the ill-fated tribunes, brought about a peace, B.C. 179, that lasted twenty-five years; but in B.C. 153 a general rising of the Celtiberians took place, followed by another on the part of the Lusitanians. The struggle lasted, with intervals of peace, for the space of twenty years, but ended in the final overthrow of the undisciplined and uncivilized combatant. All the valor of the shepherd warrior Viriathus (q.v.), even if the assassin's steel had spared his life, would not have prevented the annexation of Lusitania to the Roman Empire, nor did the heroism of the besieged Numantines avail against the skill of the younger Scipio.

Toward the conclusion of the Numantine War occurred the first of those social outbreaks known as 'servile' or 'slave' wars, which marked the later ages of the Republic. The condition of the slaves has been already referred to; but what aggravated the wretchedness of their lot was the fact that most of them had been originally freemen—not inferior in knowledge, skill, or accomplishments to their masters, but only in force of character and military prowess. The first slave insurrection broke out in Sicily, B.C. 134, where the system was seen at its worst. Its leader was one Ennus, a Syrian, who, mimicking his native monarch, took the title of King Antiochus. The suddenness and fury of the revolt for a time rendered all opposition impossible. The slaves overran the island, and routed one Roman army after another. In B.C. 132 the Consul Publius Rupilius restored order in the island. In the East fortune continued to smile upon the Roman arms, Attalus III. Philometor, dying B.C. 133, bequeathed his client-kingdom of Pergamum to its protector, Rome; and after a fierce struggle with a pretender called Aristonicus, the Romans obtained possession of the bequest, and formed it into the Province of Asia, B.C. 129.

We may here enumerate the different provinces into which the Roman Senate divided its foreign conquests in the order of their organization: (1) Sicily, B.C. 241; (2) Sardinia and Corsica, B.C. 238; (3) Hispania Citerior and (4) Hispania Ulterior, B.C. 205; (5) Gallia Cisalpina, B.C. 191; (6) Macedonia, B.C. 146; (7) Illyricum, *circa* B.C. 146; (8) Achaia (or Southern Greece), *circa* B.C. 146; (9) Africa (i.e. the Carthaginian

territory), B.C. 146; (10) Asia (kingdom of Pergamum), B.C. 129. A few years later, B.C. 118, an eleventh was added by the conquest of the southern part of Transalpine Gaul, and was commonly called, to distinguish it from the rest of the country, 'the Province;' hence the modern *Provence*.

In Africa, the overthrow of Jugurtha (q.v.), B.C. 106, by the Consul Marius, added yet further to the military renown and strength of the Republic. Meanwhile, from a new quarter of the world, a gigantic and unforeseen danger threatened the Roman State. North of the Alps there had long been roaming in the region of the Upper Danube an unsettled people called the Cimbri (q.v.), whose original home was probably the northwest of Germany. They first came into collision with the Romans in Noricum, B.C. 113; after which they turned westward, and poured through the Helvetian valleys into Gaul, where they overwhelmed alike the native tribes and the Roman armies. At Arausio (Orange), on the Rhone, B.C. 105, a Roman army of 80,000 was annihilated; but instead of invading Italy, the barbarians blindly rushed through the passes of the Pyrenees, wasted precious months in contests with native tribes of Spain as valiant and hardy as themselves, and gave the Romans time to recover from the effects of their terrible defeat. Marius, who had just returned from his Numidian victories, was reappointed consul; and at Aquæ Sextiæ (Aix, in Provence) he overwhelmed the Teutones, a northern horde, who had accompanied the Cimbri in their irruption into Spain (B.C. 102). Next year, on the Raudian Fields, in Transpadane Gaul, the same doom befell the Cimbri themselves. In the same year a second insurrection of the slaves in Sicily, which had reached an alarming height, was suppressed by the Consul Marcus Aquilius.

In the succeeding years the internal history of Rome is a scene of wild confusion and discord. Marius, an admirable soldier, but otherwise a man of mediocre talents, and utterly unfit to play the part of a statesman, was the idol of the poor citizens, who urged him to save the State from the misgovernment of the rich. His attempts were failures. Not less fruitless was the wise and patriotic effort of Livius Drusus to effect a compromise between the privileges of the rich and the claims of the poor. The digressive party among the former, i.e. the senate, were enraged by his proposition to double their numbers by the introduction of 300 equites; the latter by his offer to the 'Latins' and 'allied Italians' of the Roman franchise. Drusus fell B.C. 91, by the steel of an assassin. Hardly a year elapsed before the whole of the subject 'Italians,' the Marsians, Pelignians, Marrucinians, Vestinians, Picentines, Samnites, Apulians, and Lucanians, were up in wild and furious revolt against Rome (Marsic or Social War); and, though the rebellion was crushed in less than two years by the generalship of Marius, Sulla, and Pompeius Strabo (father of the great Pompey), aided by the shrewd diplomacy of Rome, the insurgents virtually triumphed; for the promise which Drusus had held out to them of the 'Roman franchise,' was made good by the *Lex Plautia Papiria*, B.C. 89. The jealousy that had long existed on the part of Marius toward his younger and more gifted rival, Sulla (q.v.), kindled into a flame of hate when the latter was elected consul B.C. 88,

and received the command of the Mithridatic war — an honor which Marius coveted for himself. Then followed the fearful years of civil war (B.C. 88-82), the partisans of Marius continuing to fight fiercely after their leader's death (B.C. 86); proscriptions and massacres were the order of the day. Sulla, the leader of the aristocracy, which was nominally the party of order, triumphed, but the energy displayed by the revolutionists convinced him that the 'Roman franchise' could never again be safely withdrawn from the 'Italians,' and Roman citizens, therefore, they remained till the dissolution of the Empire; but, on the other hand, Sulla's whole legislation was directed toward the destruction of the political party of the bourgeois and to the restoration to the senatorial aristocracy and priesthood of the authority and influence they had possessed in the times of the Punic wars. That his design was to build up a strong and vigorous executive cannot admit of doubt, but the rottenness of Roman society was beyond the reach of cure by any human policy. It would be hopeless in our limits to attempt even the most superficial sketch of the complicated history of this period, which will be found given with considerable fullness of detail in the biographies of its leading personages, POMPEY, SERTORIUS, MITHRIDATES, CICERO, CATTILINE, CESAR, CRASSUS, CATO, CLAUDIUS PULCHER, BRUTUS, CASSIUS, ANTONIUS, AUGUSTUS. The very utmost we can attempt is to enumerate results.

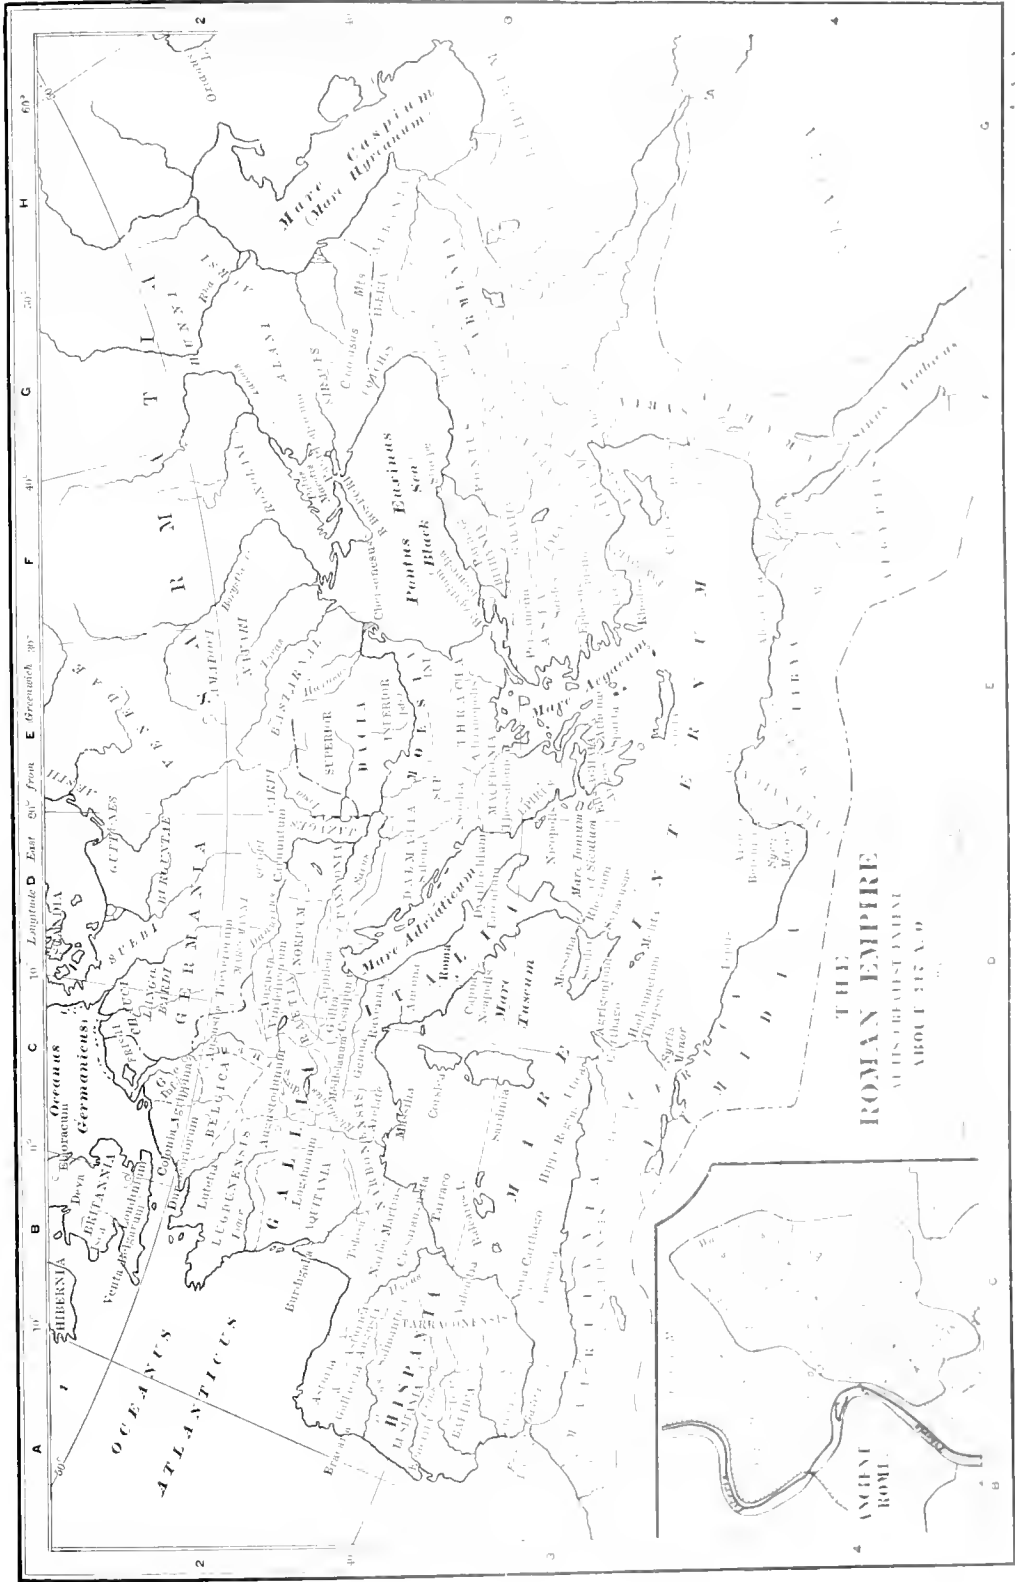

Abroad the Roman army continued as before to prove irresistible. About thirteen years after the extermination of the northern barbarians, the Cimbri and Teutones, or in B.C. 88, broke out in the Far East the first of the three 'Mithridatic wars.' Begun by Sulla, B.C. 88, they were brought to a successful close by Pompey, B.C. 65, although the general that had really broken the power of Mithridates was Lucullus. The result was the annexation of the Kingdom of Pontus, as a new province of the Roman Republic. In B.C. 64 Pompey marched southward with his army, deposed Antiochus Asiaticus, King of Syria, transforming his kingdom also into a Roman province, and in the following year he made Palestine a dependency of Rome. In B.C. 63 there was hatched at Rome the conspiracy of Catiline (q.v.), which, if it had not been frustrated by the Consul Cicero, would have placed at least the city of Rome at the mercy of a crew of aristocratic desperadoes and cut-throats. One thing now becomes particularly noticeable, the paralysis of the senate. In spite of all that Sulla did to make it once more the governing body in the State, the power passed out of its hands. Torn by jealousies, spites, and piques, it could do nothing but squabble or feebly attempt to frustrate the purpose of men whom it considered formidable. Henceforth the interest as well as the importance of Roman history attaches to individuals, and the senate sinks deeper and deeper into insignificance, until at last it becomes merely the council of the emperors. The famous coalition of Crassus, Pompey, and Cesar (known as the *First Triumvirate*), formed in the year B.C. 60, showed how weak the Government and how powerful individuals had become; and the same fact is even more clearly shown by the lawless and bloody tribunes of Clodius and Milo (B.C. 58-57), when Rome was for a while at the mercy of bravos and gladiators. The campaigns of Cesar in Gaul (B.C. 58-51), by

which the whole of that country was reduced to subjection; his rupture with Pompey; his deposition of the senate; the civil wars; his victory, dictatorship, and assassination; the restoration of the senatorial oligarchy; the second triumvirate, composed of Antony, Lepidus, and Octavianus (Augustus); the overthrow of the oligarchy at Philippi; the struggle between Antony and Octavianus; the triumph of the latter, through his victory at Actium over the fleets of Antony and Cleopatra (B.C. 31), and his investment with absolute power for life (B.C. 29), which put an end at least to the civil dissensions that had raged so long (and was therefore so far a blessing to the State), are described in the biographical articles already referred to.

THE ROMAN EMPIRE. When Augustus had gathered up into himself all the civil and military powers of the State, its political life was at an end. Rome had been transformed into an empire, in which some of the forms of the Republic, including the senate and consulship, were preserved. When Augustus died (A.D. 14), the Roman Empire was separated in the north from Germany by the Rhine, but it also included both Holland and Friesland; from the vicinity of the Lake of Constance the boundary followed the Danube to Lower Mesia, though the imperial authority was far from being firmly established there. In the extreme east the boundary-line was, in general, the Euphrates; in the south, Egypt (annexed on the death of Cleopatra in B.C. 30), Libya, and, in fact, the whole of Northern Africa, as far inland as Fezzan and the Sahara, acknowledged Roman authority. The Roman franchise was extended to transmarine communities, and in the western provinces especially it became quite common. To keep under subjection this enormous territory—containing so many different races—an army of forty-seven legions and as many cohorts was maintained, levied mainly among the newly admitted burgesses of the western provinces. The reigns of Tiberius (A.D. 14-37), Caligula (A.D. 37-41), Claudius (A.D. 41-54), Nero (A.D. 54-68), Galba (A.D. 68), Otho (A.D. 69), and Vitellius (A.D. 69) present little of any moment in a general survey of the external history of the Empire. The most notable incident of this period is probably the concentration of the prætorian guards in the vicinity of Rome during the reign of Tiberius. Under Claudius, the conquest of Britain, to which Cæsar had made two expeditions, was begun. In Nero's time Armenia was wrested from the Parthians, and only restored to them on condition of their holding it as a fief of the Empire; the Roman authority in Britain was extended as far north as the Trent; and a great rebellion in Gaul (not, however, against Rome, but only against Nero), headed by Julius Vindex, a noble Aquitanian and a Roman senator, was crushed by T. Verginius Rufus, the commander of the Germanic legions. During the profound peace that the Empire had enjoyed everywhere, except on its frontiers, its material prosperity had greatly increased. The population was more than doubled; the towns became filled with inhabitants and embellished with splendid monuments of architecture and sculpture; the wastes were peopled, wherever, at least, the publicani (q.v.) or farmers-general had not got the land into their hands; Roman literature reached its culmination; the refinements of civilization were carried to the Roman frontiers in

the far north and to the borders of the African desert in the south; but the immorality of the rich, especially among the women, became yet worse than before, and corruption reigned supreme at the centre of authority.

With the accession of Vespasian (A.D. 69-79) a better era commenced, which, if we except the reign of Domitian, continued uninterrupted for a space of one hundred years, comprising the reigns, besides those mentioned, of Titus (A.D. 79-81), Nerva (A.D. 96-98), Trajan (A.D. 98-117), Hadrian (A.D. 117-138), Antoninus Pius (A.D. 138-161), and Marcus Aurelius Antoninus (A.D. 161-180). These were all men of fine and honorable character. Under all of them the provinces were better governed, the finances better administered, and public morals wonderfully improved. After the time of Vespasian the worst days of Rome (in a moral point of view) were over. Bad emperors she had as well as good, but they did not again succeed in corrupting their age. How far the change was due to the influence of the ever-extending Christian religion it is impossible to tell; but that Christianity did send a reinvigorating breath of new life through the old decaying body of the State is beyond all dispute, and is written on the very face of the history of the first centuries. The chief military events, from the days of Vespasian to those of Marcus Aurelius, are the final conquest of Britain by Agricola (q.v.), the conquest of the Dacian monarchy by Trajan, the victorious invasion of Parthia and of Northern Arabia; the conquest of the valley of the Nile as far south as Upper Nubia, by Trajan; and the chastisement of the Marcomanni, Quadi, Chatti, etc., by Marcus Aurelius. Hadrian's long rule of twenty-one years was peaceful, but is memorable as the most splendid era of Roman architecture. The reigns of Commodus (q.v.), Pertinax (q.v.), and Didius Julianus (q.v.) were insignificant, except in so far as they show the wretched confusion into which the administration of affairs had fallen. Able generals, respectable jurists, honorable senators are not wanting, but their influence is personal and local. The reign of Septimius Severus (A.D. 193-211) is memorable as marking the first real change in the attitude of the emperors toward Christianity. The new religion was beginning to make itself felt in the State; and Severus, who was a Carthaginian, while his wife was a Syrian, may have felt a special interest in a faith that like themselves was of Semitic origin. At all events it was taken under the Imperial protection, and began to make rapid way. Caracalla (q.v.) and Elagabalus (q.v.) are perhaps the worst of all the emperors in point of criminality; but the mad brutality of the one and the monstrous debauchery of the other were purely personal affairs, and were regarded with horror by the citizens of the Empire. The reign of Alexander Severus (A.D. 222-235) was distinguished by wisdom and justice. After the death of Severus followed a period of confusion and bloodshed. The names of Maximinus (q.v.), Maximus (q.v.), Balbinus (q.v.), Gordianus (q.v.), and Philip recall nothing but usurpation, often ending in assassination. Then followed the beginning of the end. The whole of Europe beyond the Roman frontier began to ferment. The Franks showed themselves on the Lower Rhine, the Swabians on the Main; while the Goths burst through Dacia, overthrew the

ANCIENT
 ROME

Emperor Decius (q.v.), and ravaged the whole northern coast of Asia Minor. A little later—during the reigns of Valerianus (q.v.), Gallienus, and the so-called *thirty tyrants*—the Empire is nothing but a wild distracted chaos. Franks, Alemanni, Goths, and Persians rushing in from their respective quarters. The Goths swept over the whole of Achaia, pillaging and burning the most famous cities—Athens, Corinth, Argos, etc.; while the hosts of Sapor committed even greater havoc in Syria and Asia Minor, and but for the courage and skill of Odenathus, husband of Zenobia (q.v.), who had built up a strong independent kingdom in the Syrian desert, with Palmyra for its capital, might have permanently possessed themselves of the regions which they merely devastated. With Claudius Gothicus (A.D. 268-270), the fortunes of the Empire once more begin to brighten. By him, and his successors Aurelian (q.v.), Probus (q.v.), and Carnus, the barbarians of the north and northwest, as well as the Persians in the east, were severely chastised. Nay, when Diocletian obtained the purple (A.D. 284), it seemed as if the worst were over, and the Empire might still be rescued from destruction; but his division of the Empire into East and West, with separate *Augusti* and assistant *Cæsars*—though it sprang from a clear perception of the impossibility of one man's administering successfully the affairs of so vast a State—led to those labyrinthine confusions and civil wars, in which figure the names of Maximian (q.v.), Constantius, Galerius (q.v.), Maxentius (q.v.), Maximinus (q.v.), Licinius (q.v.), and Constantine, and which were only brought to a close by the genius of the last-mentioned. Under Constantine (sole Emperor A.D. 323-337) occurred the establishment of Christianity as the religion of the State. Constantine transferred the seat of government from Rome to Byzantium on the Bosphorus, where he founded a new city, and named it after himself, Constantinople. But no sooner was the statesman dead than the discords that he had kept under by the vigor of his rule broke loose; the Empire underwent a triple division among his sons; and though Constantius, the youngest, soon became sole ruler, he failed to display the genius of his father, and in his repeated campaigns against the Persians reaped nothing but disaster and disgrace. But the political fortunes of the Empire now possess only a secondary interest: it is the struggle of the Christian sects and the rise of the Church that mainly attract the attention of the historian. There, at least, we behold the signs of new life—a zeal, enthusiasm, and inward strength of soul that no barbarism could destroy. Christianity came too late to save the ancient civilization, but it enabled the Roman world to endure three centuries of utter barbarism, and afterwards to recover a portion of the inheritance of culture that it once seemed to have lost forever. The attempt of the Emperor Julian (A.D. 361-363) to revive paganism was an anachronism. After the death of Julian, who shortly before his accession had beaten back the Franks and Alemanni, the signs of the approaching dissolution of the Empire became more unmistakable. Yet the great State again and again put forth a momentary strength that amazed her foes, and taught them that even the expiring struggles of a giant were to be feared. Valentinian (q.v.), Gratian (q.v.), and Theodosius the Great (q.v.) were rulers worthy

of better times. But they fought against destiny, and their labor was in vain. Already swarms of Huns (q.v.) from the east had driven the Goths out of Dacia, where they had long been settled, and forced the Visigoths to cross the Danube into the Roman territory, where the cruelty and oppression of the Imperial officers goaded the refugees into insurrection, and in their fury they devastated the whole East from the Adriatic to the Euxine. Theodosius, indeed, subdued and even drove them back, but he could not prevent them from driving nearer to the heart of the Empire, and already they are found scattered over all Achaia and Northern Italy. For a brief moment (A.D. 390-395) the Roman world was reunited under the rule of Theodosius the Great. On his death occurred the final division into the Western Empire and the Eastern or Byzantine (Greek) Empire. Arcadius and Honorius, the sons of Theodosius, succeeded to the sovereignty of the East and West respectively. Hardly was Theodosius dead when the Visigoths rose again, under their chief, Alaric (q.v.), against Honorius, Emperor of the West. Rome was saved only by the splendid bravery and skill of Stilicho (q.v.), the Imperial general; but after his assassination the barbarians returned, sacked the city (A.D. 410), and ravaged the peninsula. Four years earlier hordes of Suevi, Burgundians, Vandals, and Alani burst into Gaul (where the native Celts had long been largely Romanized in language and habits), overran the whole, and then penetrated into Spain. It is utterly impossible (within our limits) to explain the chaotic imbroglio that followed in the West—the struggles between Visigoths and Vandals in Spain, between Romans and both, between usurpers of the purple and loyal generals in Gaul; the fatal rivalries of Boniface, Governor of Africa, and Aëtius, Governor of Gaul, which led to the invasion of Africa by the Vandals under Genseric (q.v.), and its devastation from the Straits of Gibraltar to Carthage (A.D. 429). Meanwhile in the East the Huns had reduced vast regions to an utter desert. In 451 they swept westward as far as the interior of Gaul. Here they were checked by the forces of Aëtius and the Visigoths on the Catalaunian Plain. In the following year Rome was saved from their assault only through the personal interposition of its Bishop, Leo the Great. Aëtius was assassinated by his sovereign Valentinian III., whose outrages led to his own murder; while his widow, Eudoxia, to be revenged on his murderer and successor, Petronius Maximus, invited Genseric over from Africa, and exposed Rome to the horrors of pillage at the hands of a Vandal horde. Ricimer, of the nation of the Suevi, next figures as a sort of governor of the city, and what relics of empire it still possessed, for Gaul, Britain, Spain, Western Africa, and the islands in the Mediterranean, had all been wrested from it. While Majorian—the last able Emperor—lived, Ricimer's position was a subordinate one, but, thenceforth, the Western Emperor was merely an Emperor in name, while the real sovereignty was exercised by this *Suevic maître du palais*, who was succeeded in his functions by the Burgundian King Eudobald, and the latter again by Orestes, in whose time the final catastrophe happened, when Odoacer (q.v.), placing himself at the head of the barbarian mercenaries of the Empire, deposed the last occupant of the throne

of the *Centors* (A.D. 476), who, by a curious coincidence, bore the same name as the mythical founder of the city—Romulus. The Empire of the East (see *BYZANTINE EMPIRE*) outlived the Roman Empire by nearly 1000 years. See paragraph *History* under *ITALY*; *PAPAL STATES*. Roman archaeology has been treated under the head of *ARCHAEOLOGY*. For the art and religion of ancient Rome, see *ROMAN ART* and *ROMAN RELIGION*.

ROME. A city and the county-seat of Floyd County, Ga., 72 miles northwest of Atlanta; at the junction of the Etowah and the Oostanaula rivers, which here unite to form the Coosa, and on the Southern, the Chattanooga, Rome and Southern, the Nashville, Chattanooga and Saint Louis, and other railroads (Map; Georgia, A 1). It is the seat of Shorter College for Women (Baptist), opened in 1877. Among other features of the city are eight iron bridges, which connect Rome and its suburbs; Mobley Park; the post-office building; and the county court house. Rome is the centre of one of the most productive sections of the State. The river valleys yield large crops of cotton, grain, and hay, and the higher land many varieties of fruit. In addition to its

commercial importance, Rome has acquired considerable prominence as an industrial city. It has cotton mills, planing mills, hosiery mills, a tannery, stove works, machine shops, an iron furnace, a large nursery, and manufactories of cottonseed oil, plows, scales, furniture, fertilizers, wrapping twine, brick, lime, crates and boxes, trousers, and mattresses. The government, under the charter of 1883, is vested in a mayor, chosen biennially, and a unicameral council. The water-works are owned and operated by the municipality. Rome was chartered as a city in 1847. In 1863 the Confederate General Forrest with 600 men here captured a Federal force of 1800 under General Streight, and in 1864 the city was occupied for some time by General Sherman. Population, in 1890, 6957; in 1900, 7291.

ROME. A city in Oneida County, N. Y., 15 miles northwest of Utica; at the junction of the Erie and Black River canals; on the Mohawk River and on the New York Central, the New York, Ontario and Western, and other railroads (Map; New York, E 2). An attractive residential city, Rome is regularly laid out with wide, beautifully shaded streets. The main features of interest are the Jarvis and Young Men's Christian Association libraries, State Custodian Asylum, Deaf Mute Institute, and Saint Peter's Academy. The city is the shipping centre of a dairying and farming section, especially noted for its large output of cheese, butter, and hops. The principal manufactures are steel rails, locomotives, brass and copper products, bath-tubs, knit goods, beer, and brick. The government is vested in a mayor, chosen biennially, and a unicameral council. Other administrative officials, with the exception of the school board, which is elected by popular vote, are appointed by the mayor. The water-works are owned and operated by the municipality. On the site of Rome, Fort Stanwix was built in 1758. Near here on August 6, 1777, the battle of Oriskany (q.v.) was fought. Soon after the Revolution Rome was permanently settled, and was organized as a town in 1796. The village was incorporated in 1819, and in 1870 was chartered as a city. Population, in 1890, 14,991; in 1900, 15,343.

ROME. The name of the second novel (1895) of Emile Zola's 'trilogy'—*Lourdes, Rome, and Paris*. The young priest and hero of *Lourdes*, Pierre Froment, here continues, in the Papal capital, his experiences, which appear to show him how unsatisfactorily, even in Rome, Catholicism enters into the vital progress of modern civilization. He is made to observe, by contrast, the grand working powers of science and of nature.

ROME, UNIVERSITY OF. An institution founded in 1303 by Pope Boniface VIII. It perished during the Great Schism, and was refounded in 1431 by Eugenius IV. It was a Papal institution until 1870, when it came under control of the Italian Government. This university is the old Studium Urbis, now the Royal University, and is not to be confounded with the University of the Curia or the Papal Court, which was founded by Innocent IV. in 1244-45. The Royal University had in 1901 a budget of about 975,000 lire, and between 2300 and 2400 students, and included an engineering school and a school of pharmacy besides the faculties of philosophy, science, and law. Its library, the Biblioteca Alessandrina, contains about 95,000 volumes, besides 60,000

pamphlets and several hundred manuscripts. The university comprises one college, the Collegio Capranica, founded by Cardinal Capranica in 1458.

ROMEO AND JULIET. A tragedy by Shakespeare, first printed surreptitiously by Danter in 1597, probably from an odd-stage copy. A corrected edition appeared in 1599. The earliest form of the play was written possibly in 1591, while the development into the present setting can be detected by comparing the two editions. The source of the story of the lovers is a tale in the collection of Massuccio di Salerno, printed in 1476, though similar incidents are found in a romance by Xenophon Ephesus, a mediæval Greek writer. It was told again by Luigi da Porto in his *Historia di due nobili amanti* in 1530, derived from oral sources and the first to give the names of the lovers. The story was told in verse by Gherardo Boldiero in 1553, and again by Bandello as *La sfornata marcia di due infelicitissimi amanti*, in his *Novelle* in 1554. This was translated into French by Pierre Boistean in his *Histoires tragiques*, 1559, and thence into English by Paynter in the *Palace of Pleasure*, 1567, as *Rhomo and Julietta*. The direct source of the tragedy, an English poem, "The Tragicall Historie of Romeus and Juliet," was written by Arthur Brooke in 1562, who mentioned an odd play on the subject, now lost. The tale has no historical foundation, though told in Girolamo della Corte's *Storia di Verona* in 1594, as an event of 1303. It has been a favorite subject for musical composers. Zingarelli produced the opera *Giulietta e Romeo* in 1796; Bellini, *I Capuletti ed i Montecchi* in 1830; and Gounod, *Roméo et Juliette* in 1867; while Berlioz wrote the dramatic symphony *Roméo et Juliette* in 1839.

ROMERO, rō-mā'rō, MATIAS (1837-98). A Mexican diplomat, born and educated in Oaxaca. He studied law in the City of Mexico and was admitted to the bar in 1857. From 1859 to 1863 he was connected with the Mexican legation at Washington, most of the time as chargé d'affaires; and, after serving under Diaz against the French, returned to Washington as plenipotentiary. Returning to Mexico in 1868, he was for six years Secretary of Treasury (1868-72, and 1877-78), and for two years Postmaster-General. From 1882 until his death, except for an interval in 1892, he was again Minister to the United States. He published many official reports, *Correspondence of the Mexican Legation at Washington During the French Intervention* (1870-85), *Geographical and Statistical Notes on Mexico* (1898), and *Mexico and the United States* (1898).

ROMEYN, rō'mīn, JOHN BRODHEAD (1777-1825). An American clergyman. He was born at Marbletown, Ulster County, New York, received his early education at an academy, since developed into Union College, and graduated at Columbia in 1795. In 1798 he was licensed to preach by the Classis of Albany, and the following year was ordained pastor of the Reformed Dutch Church of Rhinebeck, New York. In 1803 he became pastor of the Presbyterian Church in Schenectady and the following year accepted a call from the First Presbyterian Church in Albany. In 1808 he removed to the Cedar Street Church, New York, with which he remained until his death. He was one of the movers in the es-

tablishment of the Princeton Theological Seminary and served as director until his death. In 1810, then only thirty three, he was appointed Moderator of the Presbyterian General Assembly.

ROMFORD, rom'fōrd. A market town in Essex, England, on the Bourne, 12 miles east-northeast of London (Map: England, C. 5). It is noted for its ale breweries and market gardens, which are extensively cultivated; it has also iron works and pyrotechnic factories, and grain and cattle markets are periodically held. Romford dates from the Saxon period. Population, in 1901, 13,650.

ROM'ILLY, Sir SAMUEL (1757-1818). An English jurist, born at Westminster. He was called to the bar in 1783, and in 1805 was made Chancellor of the County Palatine of Durham, which position he held until 1815. He was returned to Parliament several times and was active in securing various reforms, especially in the mitigation of the harsh criminal laws. He was opposed by the conservative faction in the House of Commons. His mind was deranged by the death of his wife and he committed suicide in 1818. Besides numerous pamphlets, he published: *Observations on the Criminal Law of England* (London, 1813); *Thoughts on Executive Justice* (ib., 1786); *Objectious to the Project of Creating a Vice-Chancellor of England* (ib., 1813).

BARON ROMILEY, son of Sir Samuel, was successively Solicitor-General, Attorney-General, and Master of the Rolls. He performed a great public service in the supervision of a compilation and collection of the Public Records of England.

ROM'NEY, GEORGE (1734-1802). An English portrait painter, born at Dalton, in Lancashire. In 1753 he was apprenticed for a short time to Steele, a portrait painter, at Kendal, after which he settled at Westmoreland, where he practiced portrait painting for several years. In 1762 he went to London, where his "Death of Wolfe" won him a prize of the Society of British Artists. He also studied in Italy and France, being much influenced by Titian in color, and by Greuze, whose sentimental manner he adopted. Upon his return to London, in 1775, he became very popular and divided patronage with Reynolds and Gainsborough. He continued to reside there until 1799, when he returned to his wife, whom he had deserted when he first went to London, and who now nursed him until his death. He had bestowed his affections upon his favorite model, the beautiful Emma Hart, afterwards Lady Hamilton, whom he painted as Baccante, Citee, Jean of Arc, Magdalen, and Sibil. Among his other works are portraits of Mrs. Crawford and child, Lady Cavendish Bentinck, Miss Sneyd as Serena, Lady Warwick and her children, Mrs. Davenny, the actress, and Lady Russell and child (1784). In the National Gallery are the "Parson's Daughter" and "Baccante," in the National Portrait Gallery, a portrait of Richard Cumberland and Lady Hamilton. The art of Romney has been described by Arthur as "holding the mean course between the refined classic art of Reynolds and the imaginative poetic art of Gainsborough." He was a very dexterous painter and possessed the art of beautifying his model without making the picture unlike the original. His treatment was broad and the number of colors was limited, but he used them at times with depth and harmony. Consult: Hagley, *The*

George Romney (London, 1809); John [unclear] (son of the painter), *Memoirs of the* [unclear] *Writings of George Romney* (London, 1830).

ROMNY, ró'm'no. A town in the Government of Poltava, Russia, 110 miles northwest of Poltava (Map: Russia, D 4). It has extensive manufactures of tobacco and flour. Its fairs are also important. Population, in 1879, 22,539.

ROM'OLA. A novel by George Eliot (1863), which appeared in the *Corahall Magazine*, 1862-63. The scene is laid in Florence in the fifteenth century, the time of Savonarola, who plays an important part in the story. His influence is sharply contrasted with the spirit of the Renaissance, then in its glory under the Medici. These two forces stir the soul of the heroine, the daughter of the blind scholar, Bardi. One attracts her to the beautiful Greek, Tito Melema, brilliant but false; and the other, after the disastrous failure of her marriage, leads her to a life of devotion to the unfortunate.

ROMORANTIN, ró'mó'rán'táx'. The capital of an arrondissement in the Department of Loir-et-Cher, France, 39 miles southwest of Orleans (Map: France, H 4). It has important manufactures of cloth. The edict issued from here in 1560 prevented the establishment of the Inquisition in France. Population, in 1901, 8130.

ROM'ULUS. The mythical founder of the city of Rome. His name indicates that he is to be regarded rather as a symbolical representation of the Roman people than as an actual individual. According to the legend there had ruled at Alba Longa, in Latium, a line of kings descended from the Trojan prince Æneas. One of the latest of these at his death left the kingdom to his eldest son, Numitor, Amulius, a younger brother of Numitor, deprived the latter of the sovereignty, murdered his only son, and compelled his only daughter, Silvia (generally called Rhea Silvia), to become a vestal virgin. Silvia having become the mother of twins by the god Mars, the fears of Amulius were aroused, and he caused the cradle containing the babes to be thrown into the Anio, whence it was carried into the Tiber. The cradle was stranded at the foot of the Palatine, and the infants were saved from death by a she-wolf which carried them into her den, near at hand, and suckled them, while a woodpecker brought them whatever food they wanted. Faustulus, the King's shepherd, who bore the infants home to his wife, Acca Larentia, had them brought up with his own children. In a quarrel between them and the herdsmen of Numitor, Remus, one of the twins, was taken prisoner, and carried off to Numitor.

Romulus soon made his appearance, accompanied by his foster-father; their story was related, and Numitor recognized the boys as the sons of his daughter Silvia. They immediately proceeded to avenge the family wrongs by slaying Amulius and placing their grandfather on the throne. But Romulus loved their old abode on the banks of the Tiber, and resolved to build a city there. The Palatine was chosen (by augury) for the site, and Romulus, yoking a bullock and a heifer to a plowshare, marked out the *pomerium*, or boundary, on which he proceeded to build a wall. Remus, to show its inefficiency, scornfully leaped over it, whereupon Romulus

slew him, but was immediately struck with remorse, and could obtain no rest till he had appeased the shade of his brother by instituting the *Lemuria*, or festival for the souls of the departed. Romulus next erected a sanctuary on the Capitoline for runaway slaves and homicides. But wives were much wanted; and this led to the "Rape of the Sabine Women"—a wholesale abduction of virgins, the consequence of which was a series of wars, in which, however, Romulus was invariably victorious, until Titus Tatius, at the head of a large army of Sabines, forced him to take refuge in his city on the Palatine. The treachery of Tarpeia, a daughter of a lieutenant of the fort, placed the Capitolium in the hands of his adversaries. In the battle the next day between the two hills, Sabines and Romans fought till they were exhausted, when the Sabine women rushed in between their husbands and fathers and implored them to be reconciled. This was agreed to, and henceforth they resolved to unite and to form one people—the followers of Romulus dwelling on the Palatine, those of Titus Tatius on the Capitoline and Quirinal. On the death of Titus Tatius Romulus became sole sovereign, and subsequently made successful war against the Etruscan cities of Fidene and Veii. After a reign of thirty-seven years Romulus was miraculously removed from earth. While he was standing near the "Goat's Pool," in the Campus Martius, reviewing his militia, the sun was eclipsed, and he was carried up to heaven in a chariot of fire by Mars. Some time after he reappeared, announced the future glory of the Roman people, and told them that henceforth he would watch over them as their guardian god, under the name of Quirinus. The festival of the Quirinalia, February 17th, was instituted in his honor; but the nones of Quirilis (July 7th) was the day on which he was believed to have departed from earth. As early as the end of the Republic a sacred spot, marked by a 'black stone,' by or upon the Comitium, near the Rostra, was pointed out as the grave of Faustulus, or, as some said, of Romulus. Excavations in the Forum in the year 1898-99 brought to light in this place a rectangular pavement of black marble, about ten by thirteen feet in dimensions, which for various reasons it seems safe to identify with this monument. See FORUM.

RON'ALDSHAY, NORTH AND SOUTH. Two of the Orkney Islands (q.v.).

RONCADOR (Sp., snorer, grunter), or Ronco. A name in California for several fishes of the family Sciaenide (see DRUM), which furnish both food and sport. The principal one is *Ron-*

RONCADOR (*Roncador Stearnsii*).

cador Stearnsii, from two to three feet long when full-sized, and highly esteemed. Another species is the 'red' roncador (*Corvina Saturna*).

RONCAGLIA, rôn-kä'lyä. A village in the Province of Piacenza, Italy, noted for the diets and reviews which the Holy Roman emperors frequently held here, on the Roncaglian Fields, when they descended from Germany into Italy. In 1158 Frederick Barbarossa held a diet here which determined that the cities did not possess the right to elect their own officers, and in other respects were subject to the Emperor. The result was a rebellion of the Lombard towns. See LOMBARD LEAGUE.

RONCESVALLES, *Sp. prom.* ron'thës-väl'yäs (Fr. *Roncesvaux*), a pass in the Pyrenees between Pamplona and Saint-Jean-Pied-de-Port. Here the rear guard of Charlemagne's army was defeated in 778. See ROLAND, THE SONG OF.

RONDA, rôn'dä. A town of Southern Spain, in the Province of Malaga, situated 42 miles north of Gibraltar, on the railroad between that place and Granada (Map: Spain, C 4). It is very picturesquely located among lofty mountains, and the town is divided by a gorge 300 feet wide and nearly 600 feet deep, with precipitous rocky sides, at the bottom of which rushes the Guadalquivir River. The gorge is crossed by three bridges, one said to date from Roman times, one built by the Moors, and the third built in the eighteenth century. The town itself is surrounded by olive groves and vineyards, and has a delightful climate. It is a very old town, with well-preserved remains of Moorish walls and towers, and many Moorish buildings. It has a *Plaza de Toros*. The chief industries are flour-milling and wine production. Population, in 1887, 18,350; in 1900, 20,822.

RONDEAU, rôn'dô' (Fr. *rondeau*, from OF. *rondel*, round plate, cake, scroll, diminutive of *round*, round, from Lat. *rotundus*, round, wheel-shaped, from *rota*, wheel). A French form of versification often imitated in other countries. The rondeau consists of thirteen verses, eight on one rhyme, five on another, separated by a pause at the fifth verse and by another at the eighth. The first word or words are repeated after the eighth and the thirteenth verses. The *rondeau redoublé* or doubled rondeau is a poem of twenty verses in five quatrains. The four verses of the first quatrain made successively the last verse of the other four quatrains. Sometimes a sixth quatrain, called the *enroulé*, is added, after which the first word on the first half-verse of the poem is repeated. The rondeau was a favorite form of Adam de la Halle (q.v.) and of Guillaume de Machault (q.v.) and was cultivated by many other poets. Nowadays it is seldom employed in France or elsewhere. In England the rondeau was skillfully revived by poets like Rossetti and Swinburne, Austin Dobson, and Andrew Lang. It had been used as early as Chaucer (c.1340-1400), and later by Hoccleve (c.1370-c.1450), by Lydgate (c.1370-c.1451), by Charles of Orleans both in his French and English poems (but with fourteen lines), and by others. What is known as the rondeau of Villon has only ten lines. Consult Gleeson White, *Ballades and Rondes* (London, 1887). For the musical form of similar name, see RONDO.

RONDO (It., from Fr. *rondeau*, roundel). One of the oldest and most generally used of the musical forms, characterized by the constant recurrence of one principal theme. The oldest ron-

dos of the sixteenth century consisted of a plain theme of four bars, which was followed by a few bars of interlude, when the original theme was repeated. Soon the theme itself was lengthened to eight or sixteen bars, and the interlude avoided the principal key. Then the intermediate passage appeared as a fully developed second theme in a related key. The fundamental idea of the rondo as established by Bachoven is denoting the three themes by A, B, C respectively. A, B (in key of dominant), A, C, A, B (in key of tonic), coda. Of its second and third recurrence A appears in different keys. Also, in order to avoid monotony, Bachoven does not repeat literally. When only two themes are employed the following may be given as the fundamental scheme: A, B, A (in key of B), B (in key of A), A. Under later composers (notably Chopin) the rondo form becomes even more elastic.

RONGE, rôn'gë, JOHANNES (1813-87). The principal founder of the German Catholics (q.v.). He was born at Bischofswalde, Silesia, was educated at Breslau, entered the Roman Catholic priesthood, and was settled at Grottkau when he published criticisms of the relation between Rome and the Breslau Cathedral chapter, and was suspended in consequence (1843). He then went to Laurahütte in Upper Silesia as a teacher, and while there the exhibition of the Holy Coat (q.v.) at Treves so stirred his ire that he denounced it in print (1844), and was excommunicated. The agitation occasioned by his action led to the founding of the German Catholic Church, and he became pastor of the German Catholic Church at Breslau in 1845. Ronge took part in the political struggles of 1848 and was prominent as a democratic leader. From 1849 to 1861 he was a fugitive in consequence of his political activities. When permitted to return he went to Breslau, and in 1863 to Frankfurt, and endeavored to revive the waning German Catholicism. In 1873 he removed to Darmstadt, and there edited a paper in promotion of his plans. He died in Vienna, October 26, 1887. Consult *The Autobiography and Justification of J. Ronge*, Translated from the Fifth German Edition (London, 1846).

RONGER, rôn'zhë', FLORENCE. The real name of the French musical composer commonly known as Hervé (q.v.).

RONGS. A Tibetan people. See LEPCHAS.

RONSARD, rôn'sär', PHILIP DE (1524-85). A French poet and literary reformer. Ronsard was born at the Château de la Poissonnière (Vendôme), of a noble family, which may have come from Hungary in the reign of Philip VI, though recently discovered documents suggest rather a Flemish origin and a less ancient nobility. At the age of nine he was sent to the College of Navarre, but he left it after six months, "without profit," he said. Then his father took him to Avignon, where he remained a little while as a page in princely service. In 1540 he accompanied Lazare de Baif on his embassy to Speyer and Guillaume de Langey (du Bellay), the Viceroy of Piedmont, to Turin. In 1542 he returned to France, apparently destined to a brilliant diplomatic or military career; but growing deafness checked his ambition in that direction and he turned to study and to literature. His first studies were shared with

Jean Antoine de Baif, son of the ambassador. This was the kernel of the future Pléiade (q.v.). Du Bellay (q.v.) soon became a fellow-student, and with him Ronsard shared in the *Deſcende et illustration de la langue française*, which inaugurated the classic reform in diction with which the Pléiade is associated. In 1550 Ronsard published his first poems, the *Odes*, and in 1552 the first of the *Amours*. These brought him honors and pensions from the Court circle, and won him the friendship of distinguished literary men. Ronsard followed up the *Odes* and *Amours* with *Hymnes* (1555 and 1556), and collected his works in four volumes (1560). In the religious wars he was a partisan of Catholicism, became recognized as the Court poet, and won new favors from Charles IX. for his *Franciade* (1572), an unfinished epic, and for many occasional poems. His last years were spent in lettered ease at two of his priories, Val-Croix and Saint-Cosme, in his native Vendômois. Here he received costly gifts from Queen Elizabeth of England, and from her prisoner, Mary of Scotland; here he made a final collection of his works (1584).

Ronsard was a master in poetic imagination, and in the technique of language and metre. His vigor and brilliancy, whether in verse or prose, had not been equaled in France. He was first to popularize the sonnet. He restored the Alexandrine line to due honor, and introduced many original lyric stanzas with which anthologies and imitation have made all familiar. His lyrics have the naïveté of the Renaissance, a free healthy naturalism, in which there is hardly ever a morbid strain.

Ronsard's works were printed seventeen times before 1630, and were well edited by Blanchemain (8 vols., Paris, 1857-67), and by Marty-Laveaux (6 vols., ib., 1887-93). There is a selection, *Œuvres choisies*, in one volume by Sainte-Beuve (Paris, 1828, and since often reprinted, with additions by Louis Moland); other selections are by Voizard, Noël, and Beq de Fouquières. For criticism and biography, consult: Pellissier's essay in Petit de Julleville's *Histoire de la langue et de la littérature française* (vol. iii., Paris, 1898, with a good bibliography); Gandar, *Ronsard imitateur d'Homère et de Pindare* (Metz, 1854); Rochembeau, *La famille de Ronsard* (Paris, 1869); Chandon, *Essai sur Ronsard* (ib., 1875); Mellerio, *Le régime de la langue de Ronsard* (ib., 1895); Pieri, *Pétrarque et Ronsard* (ib., 1895); Faguet, *XVI. siècle* (ib., 1894); and Sainte-Beuve, *Causeries du lundi*, vol. xii. (which is used also by way of introduction to later editions of the *Selections* by Sainte-Beuve, mentioned above). Among those who have translated poems by Ronsard are Henry Francis Cary, Longfellow, Lord Lytton (in *Orral*), and Andrew Lang. In his *Songs and Sonnets of Pierre de Ronsard* (Boston, 1903), C. H. Page has put into English verse seventy-six poems, most of which had not previously been translated.

RONSDORF, rôn'sdôrf. A town and railway station in the Rhine Province of Prussia, 3 miles southeast of Elberfeld. It is largely engaged in manufacturing, having iron works, foundries, machine shops, copper works, ribbon mills, dyeing establishments, etc. Population, in 1900, 13,297.

RÖNTGEN, rônt'gen, WILHELM KONRAD. See ROENTGEN, WILHELM KONRAD.

RÖNTGEN RAYS. See X-RAYS.

ROOD. The cross on which Christ suffered; in modern usage, the name is most commonly applied to the large and striking crucifix, generally with standing figures of Mary and John on either side of it, which was placed at the entrance of the choir or chancel in most mediæval churches. Often it stood on a gallery or screen, known as the rood-loft or rood-screen.

ROOD (AS. *rôd*, pole, crucifix, OHG. *ruota*, Ger. *Rute*, rod; possibly connected with Lat. *radius*, staff, Skt. *rudh*, to grow). A measure of surface. It is the fourth part of an acre and contains 40 square poles or perches.

ROOD, OGDEN NICHOLAS (1831-1902). An American physicist, born at Danbury, Conn. After graduating at Princeton in 1852 he studied at the universities of Munich and Berlin, and was made professor of physics and chemistry at the University of Troy (1858), and professor of physics in Columbia College (1863). He was elected a member of the National Academy of Sciences in 1864, and served as vice-president of the American Association for the Advancement of Science (1868). His investigations have embraced problems in mechanics, electricity, optics, and acoustics. He was the first to construct fluid prisms of great dispersive power for use in spectroscopic studies, and was also one of the first to apply photography to the microscope. His investigations on the nature of the electric spark and duration of lightning flashes are valuable, as they determined most accurately minute intervals of time. He constructed an air-pump (q.v.) which for many years held a record for high vacua, and devised a method of photometry which was independent of color. Professor Rood was able to demonstrate the regular or specular reflection of X-rays and also investigated materials of high electrical resistance. He wrote *Modern Chromatics* (New York, 1874), a standard work on color, and many scientific papers published for the most part in the *American Journal of Science*.

ROOF (AS. *icel*, *hrôf*; probably connected with Gk. *κρύπτειν*, *kryptein*, to hide). The top-most covering of a building, including its supporting framework. The commoner forms of roof are the *gambrel*, having two slopes meeting in a horizontal ridge and terminated at the end walls by triangular *gables* or pediments; the *hipped* roof, which has four sloped surfaces rising from the four walls to the short central ridge; the *gabled*, with a double slope on either side, the lower part steep, the upper part flatter; the *mansard*, which is a hipped gambrel roof with a nearly flat upper slope. Other roofs form pyramids or cones, which are called *spires* when very lofty and relatively slender. A roof of convex form on a round or polygonal plan is called a *dome* or *cupola*; if formed with a double curve it is sometimes called a *bell-roof*. A roof of a single slope from a higher to a lower side wall is called a *lean-to*, *pent*, or *shed roof*; such are the roofs of most side-aisles of churches.

The construction of roofs varies with material and span. The simplest are the primitive flat roofs of the Orient, made with cross-beams, thatch, and a heavy layer of stamped clay. In Central Syria and in Egypt important buildings were roofed with enormous beams and slabs of stone. The Greeks employed a low-pitched gable roof, carried by simple trusses of wood and cov-

ered with tiles of marble or terra-cotta. The Romans were the first to span broad halls with vaults and domes of brick or concrete, covered probably with lead for protection from the rain; they also used roofs carried by elaborate timber trusses and covered with tiles or with bronze plates. It was in the mediæval cathedrals that the system was developed of an inner covering or *ceiling* of stone vaulting, with an outer protec-

ROOK (AS. *hruc*, OIRG. *hruck*, rook; connected with Goth. *hrakjan*, to crow, Skt. *hruc*, to cry out). A species of crow (*Corvus frugilegus*), very common in the southern parts of Britain and found in many parts of Europe and Asia, even to Japan; about the same size as the common crow, but easily distinguished from it, even at a distance, by its color, which is a glossy, deep-blue black, in certain aspects grayish. On

1. KING-POST ROOF.

2. QUEEN-POST ROOF.

tive roof of timber trusses sheathed with boards and covered with copper, lead, slate, or tiles; these roofs were of a very steep pitch. At the same time there were built many roofs without the stone vaultings, the timber supporting trusses being exposed to new and decoratively treated ('open-timber roofs') and the spaces between them richly paneled. Since the Renaissance it has been customary to hide the roof behind a decorative ceiling of plaster or of paneled woodwork; on the other hand, the external roof has received much attention, and its form and decorative treatment are important elements in the design of many modern edifices. In those, however, of Italian classic type, the roof is kept nearly flat and masked by balustrades and parapets.

The structural design of the trusses or other framework which supports the roof has in all ages been one of the determining factors in architectural development. In modern practice, although wood is by far the commonest material used, steel takes its place for structures of great span, and by its use spans 376 feet wide have been roofed without intermediate supports (Liberal Arts Building, Chicago Columbian Exhibition, 1893). For such roofs arched trusses are used. Iron and steel roofs of 250 feet span are not uncommon in railway stations. The largest vaulted roof is that of the Pantheon at Rome, a dome 142 feet in diameter. See **DOME**.

In ordinary roof construction the truss is of the *king-post* type (Fig. 1), for spans up to 35 feet; or the *queen-post* type (Fig. 2) for spans up to 60 feet; though there are more complex types. The horizontal beams resting on these are called *purlins*; these carry the *jack-rafters*, and to these last is nailed the *sheathing*, which is covered by the *roofing*. The roofing may be of tar and gravel, of tin or of copper (for nearly flat roofs), of shingles, slates, metal tiles, or terra-cotta tiles for steep roofs. The part of the roof which projects over the wall is called the *eaves*, and the trough for carrying off the rainwater, the *gutter*. Consult: Denfer, *Couverture des édifices* (Paris, 1893); Merriman and Jacoby, *Roofs and Bridges* (New York, 1896); and the authorities referred to under **BUILDING**.

ROOFING FELT. See **FELT**.

a nearer view a more notable distinction is found in the naked warty skin at the base of the bill, extending back rather beyond the eyes, and quite far down on the throat. The rook is gregarious; and very large companies often assemble in rookeries, making their nests in close proximity, generally in tall trees, the same tree often sustaining many nests. Most cities or large towns in Great Britain have rookeries, sometimes of considerable magnitude. In all of their habits rooks are much like the American crows. Consult writings of European naturalists, especially as to the flocking, Selous, *Bird Watching* (London, 1901).

ROOKE, Sir GEORGE (1650-1709). An English admiral. He was born near Canterbury, at the country-seat of his father, Sir William Rooke. He entered the navy, saw active service against the Dutch, and in 1689 was promoted to the rank of rear-admiral. He was engaged in the action off Beachy Head in 1690 between the Earl of Torrington and the French admiral Fourville, and in 1692, in the battle of La Hogue, fought between the French fleet and the combined English and Dutch force under Admiral Russell, led the night attack on the enemy's fleet which resulted in the burning of 13 French ships with the loss on the allied side of only 10 men. For his brilliant services on this occasion he received the rank of vice-admiral of the red, the honor of knighthood, and a pension of £1000 a year. His next important service was the destruction of a Franco-Spanish plate fleet in the port of Vigo; and in July, 1704, in connection with Sir Cloudesley Shovel, he accomplished the capture and annexation to the British Crown of Gibraltar (q.v.). A few days later off Malaga, he fought an indecisive battle with a French fleet of superior force, under the Comte de Toulouse; the French loss was upwards of 3000, the English upwards of 2000 men. Consult *The Life and Glorious Actions of Admiral Sir George Rooke, M.P.* (London, 1707; new ed., 1713).

ROON, von, ALBRECHT TUDORUS PRINZ, Count von (1805-79). A Prussian black-and-white minister, born at Pleustagen near Kollberg. He was trained at the military school in Berlin, and in 1836 was appointed to the general staff with the rank of captain. In 1858 he was

commander of the Fourteenth Division, and six months later became lieutenant-general. In 1859 he was made Minister of War, and in 1861 became also Minister of Marine, holding that office for 10 years. The splendid effectiveness of the German army in 1866 and 1870-71 was due in very great measure to Von Roon's talents as an organizer and administrator. On January 1, 1873, he was made President of the Cabinet, and Field-Marshal. He resigned November 9, 1873, the ministry of war and the presidency of the Cabinet, as Bismarck found it necessary to combine his position as Imperial Chancellor with that of President of the Cabinet. Von Roon, who was a pupil of Karl Ritter, wrote a number of authoritative geographical works, the best known of which is the *Anfangsgründe der Erd-, Völker- und Staatenkunde* (1834). Consult: Waldemar Count Roon, *Denkwürdigkeiten aus dem Leben des General-Feldmarschalls Grafen von Roon* (2 vols., Breslau, 1892); id., *Kriegsminister von Roon als Redner* (Gib., 1895-96).

ROOS, rōs, **JOHANN HEINRICH** (1631-85). A German animal painter and etcher, born at Otterberg in the Palatinate. Early in life he went to Amsterdam, where he studied under Juliana du Jardin, Barend Graat, and Adriaen de Brie. In 1650-54 he visited Italy, France, and England, in 1657 settled at Frankfort, and in 1673 was appointed court painter to the Elector-Palatine. At first Roos painted portraits and genre scenes, but soon turned to those animal pieces with landscape surroundings, for which he is famous, excelling particularly in the representation of sheep. His works, notwithstanding their great finish and his comparatively short life, are very numerous and are to be found in the Pinakothek in Munich, in Berlin, Dresden, Vienna, and Frankfort, while two may be seen in the collection of the Historical Society, New York. His forty-four etchings are also held in great esteem. His son and pupil, **PHILIPP PETER** (surnamed Rosa di Tivoli) (1655-1705), born at Frankfort, painted landscapes and animals, in his earlier period in the style of his father; but in 1677 he went to Rome, studied under Brandi, whose daughter he married, and after settling at Tivoli, whence his surname, he adopted a peculiar style of his own, painting life-size figures and animals in a broad manner and a heavy brown tone and producing a rather unpleasant effect. Another son and pupil, **JOHANN MELCHIOR** (1659-1731), born at Frankfort, was an animal and portrait painter. The Darmstadt and Stuttgart museums contain each a "Stag Hunt" and a "Boar Hunt," the Dresden Gallery, "Stags Under an Oak" (1714), and the Stüdel Gallery, Frankfort, a "Lion Family in a Landscape" (1716).

ROOSA, rōō'sā, **DANIEL BENNETT ST. JOHN** (1838—). An American physician, born at Bethel, Sullivan County, N. Y. He graduated in 1860 at the medical school of the University of New York, was assistant-surgeon in the Fifth New York Volunteers' three-months' troops, became resident surgeon at the New York Hospital in 1862, and in 1864, after study in Europe, began practice in New York City. From 1863 to 1882 he was professor of diseases of the eye and ear in the medical school of the University of the City of New York (now New York University), and from 1875 to 1880 held a similar chair in the University of Vermont (Burlington). In

1888 he was appointed professor of diseases of the eye in the New York Post-Graduate Medical School, of whose faculty he also became president. He was one of the founders of the Manhattan Eye and Ear Hospital. Among his original works are: *A Treatise on the Ear* (1866) and *On the Necessity of Wearing Glasses* (1877).

ROOSEVELT, rōz'vĕlt, **NICHOLAS J.** (1767-1854). An American inventor. He was born in New York City. His claim to distinction is based upon his invention of the vertical paddle-wheel for use in steamboats. As early as the Revolution he used the idea in a small boat in which there were two side-wheels that were turned by springs. In 1797, together with R. R. Livingston and John Stevens, he built a steamboat; but, as contrary to his advice, chains and floats were used instead of paddle-wheels, the boat proved a failure. Financial difficulties prevented him from following out his idea, and ultimately Fulton adopted it with success. In 1809 Roosevelt, after considerable controversy with Fulton, entered into a partnership with him for the introduction of steamboats on western waters. Two years later Roosevelt built at Pittsburg the boat *New Orleans*, and successfully navigated her down the Ohio and the Mississippi to New Orleans. Consult Latrobe, "A Lost Chapter in the History of the Steamboat," in vol. v. of the *Maryland Historical Society Fund Publication* (Baltimore, 1871).

ROOSEVELT, **ROBERT BARNWELL** (1829—). An American author and reformer. He was born in New York City, and was the son of Nicholas van Schaick Roosevelt and an uncle of Theodore Roosevelt. He was admitted to the bar in 1850, and practiced with success for many years. In 1867 he brought about the formation of the New York State Fishery Commission, and until 1888, when he became United States Minister to Holland, was one of its commissioners. He first entered active politics as an opponent of the 'Tweed Ring,' and as an organizer of the 'Committee of Seventy,' as vice-president of the Reform Club, and as an editor of the *Citizen*. He did much to break up that organization. In 1870 he was elected to the lower House of Congress, and served there with credit. He published: *The Game Birds of North America* (1860); *The Game Birds of the North* (1866); *Superior Fishing* (1866); *Florida and the Game Water Birds* (1868); and *Progressive Petticoats* (1871).

ROOSEVELT, **THEODORE** (1858—). The twenty-sixth President of the United States, born in New York City, October 27, 1858. He was educated at Harvard University, where he graduated in 1880, and afterwards attended the law school of Columbia University. He turned early to politics and was elected to the New York Assembly in 1881 as an opponent of the Tammany Hall machine. There, for more effective service, he allied himself with the Republican minority, although not a member of that party, and for three terms, 1882-83-84, was its leader. He was a delegate to the Republican National Convention of 1884 and in the same year removed to Melora, N. Dak., where he conducted a ranch for two years. As the Republican candidate for Mayor of New York in 1886, he opposed Henry George, Single-Taxer, and Abram S. Hewitt, Democrat, the successful candidate. From 1889 to 1895 he was a mem-

cinth bulb, in water; air roots are constructed for an aquatic medium, for instance, the dangling roots of an epiphytic orchid; clinging roots are organized for climbing, as in the ivies; prop roots are sent out to support wide-spreading branches to enable

lengthens new root-hairs appear near the tip, and the older ones perish (Figs. 1, 2). Just beneath the root-cap is the group of rapidly dividing apical cells, from which all the tissues of the root are derived. Just behind the apical group the three embryonic regions of the root begin to differentiate (Fig. 3). In the centre is the pterome, an axial mass of cells that tend to elongate. When fully organized this becomes the stele, in which originate the vascular bundles or main conducting strands of the root. Surrounding the pterome is the periblem, that later becomes the cortex, in roots a very prominent region. The cortex is covered by a single layer of cells, the dermatogen, that later becomes the epidermis. The dermatogen gives rise to the root-cap. In most roots also the epidermis behind the root-cap is replaced by a modified outer layer of the cortex, called the epiblema. Probably the chief anatomical peculiarity of the root is the central and solid woody axis, whose tissues are arranged in a way which distinguishes the root from most stems. Early in the history of perennial roots secondary changes occur, that greatly modify the general structure, especially in the appearance of growth rings, and assimilate it to that of stems. See HISTOLOGY.

FIG. 1. CROSS-SECTION OF YOUNG ROOT. Showing root-hairs with adherent soil-particles.

them to spread farther, as in the screw-pine, banyan, etc. Unlike stems, roots bear no leaves or foliar structures, joints (nodes); do not increase in length by joints, but by continuous multiplication and enlargement of apical cells; and their branches arise from the central woody cylinder.

In minute structure roots are still more distinct from stems. (See HISTOLOGY.) In general the tips bear more or less conspicuous root-caps

ROOT. In philology (q.v.), that abstract form of a word which remains after all formative elements have been removed. In strict scientific discussion in Indo-Germanic linguistics a root is regarded as pre-Indo-Germanic; that is, it is a hypothetical word derived not only by omission of all formatives, but also by comparison of all cognate words in the Indo-Germanic languages. To speak of Greek, Celtic, or Germanic roots is, therefore, scientifically inaccurate. Roughly speaking *fōt* may be called the root of *foot*, but properly the root is the hypothetical Indo-Germanic form **pōd*, as shown by a comparison of Sanskrit *pāda*, Avesta *pāda*, Armenian *otn*, Greek *ποῦς*, Doric Greek *πῶς*, Latin *pēs*, Lithuanian *padas*, Gothic *fōtus*, Old High German *fuoz*, and Anglo-Saxon *fōt*. In all probability roots never had an actual existence. Consult: Delbrück, *Einleitung in das Sprachstudium* (3d ed., Leipzig, 1893); Hirt, *Indogermanischer Ablaut* (Strassburg, 1900); Gabelentz, *Sprachwissenschaft* (Leipzig, 1901); Fick, *Vergleichendes Wörterbuch der indogermanischen Sprachen* (3d ed., Göttingen, 1874-76; 4th ed., 1890—); Persson, *Wurzelerweiterung und Wurzelvariation* (Upsala, 1891). See PHILOLOGY.

ROOT. In music, the lowest tone of any chord in its fundamental position. See CHORD; HARMONY.

ROOT. A number or expression resulting from the process of evolution. (See INVOLUTION AND EVOLUTION.) Also the values of the unknowns which satisfy an equation (q.v.) are called the roots of the equation.

ROOT, ELIHU (1845—). An American lawyer and administrator, born at Clinton, N. Y., where his father was professor of mathematics in Hamilton College, at which Elihu graduated in 1864. He began to practice law in 1867, forming partnerships with John N. Strahan in that year, with Willard Bartlett in 1876, and in 1886 with Samuel B. Clarke. Root was especially successful as a corporation lawyer and was counsel for the Sugar Trust, for New York street rail-

composed of hood-like masses of cells, which die and slough off in front, and are renewed from behind (c, Fig. 3). This cap serves to protect the delicate growing tip as the root pushes its way through the soil. Just behind the root-cap are usually very numerous and delicate hairs, which are elongated outgrowths from the epidermal cells. They increase the absorbing surface of the root and are developed only in the activity absorbing region near the tip. As the rootlet

ways, and for various railroad companies. His greatest prominence at the bar was due to his being retained as counsel for William M. Tweed in the "Tweed ring" trial; for Judge Hilton in the Stewart will case; and for Hamilton College in the Fayerweather will case. From 1883 to 1885 he was United States District Attorney in New York City. In 1899 he was appointed Secretary of War to succeed Russell A. Alger. In this capacity he planned the new War College and a modification of the rules of promotion, by which seniority ceased to be the sole claim. Another reform was the institution of the general staff. He continued in office during McKinley's second administration and under President Roosevelt until the summer of 1903, when he resigned and was succeeded by William H. Taft (q.v.).

ROOT, GEORGE FREDERICK (1820-95). An American musician and composer. He was born at Sheffield, Mass., and studied music under George J. Webb of Boston, after which he taught music in New York City (1844-45), where he was organist of the Church of the Stranger. In 1859 he became a member of the Chicago music firm of Root & Cady. He composed many popular songs and battle songs, notably "Battle Cry of Freedom," "Tramp, Tramp, Tramp," "Just Before the Battle, Mother," and the quartet, "There's Music in the Air," besides which he edited numerous books of sacred music. Other works were the cantatas *Flower Queen* (1852); *Daniel* (1852); *The Pilgrim Fathers* (1854); *Belshazzar's Feast* (1856); and *The Haymakers* (1857).

ROOT BARNACLE. See RHIZOCEPHALA.

ROOT PARASITES. Plants attached to the roots of other plants, whose elaborated food they consume. They are usually without chlorophyll. In temperate climates the best known are probably broom rape and cancer root; in tropical countries, Rafflesia (q.v.). Many species of Scrophulariaceae and the Indian pipe (*Monotropa uniflora*) are semi-parasitic.

ROOT PRESSURE. If while a plant is rapidly absorbing water by the root system, it be decapitated, water will soon ooze from the stump—a phenomenon known as bleeding. The amount may be measured and the pressure under which it escapes may be ascertained. Since the pressure thus determined was first recognized as arising in the root system, the name root pressure was given to it. Since investigation shows, however, that cells of suitable character, located in any part of the plant, under proper conditions may develop a similar pressure, the terms sap pressure and bleeding pressure are superseding it. Sap pressure is dependent upon the osmotic pressure (see OSMOSIS) of active cells which adjoin xylem bundles (see ANATOMY), into which water escapes and travels to the point of exit under the pressure of additional quantities of water from behind. There is no satisfactory explanation of the action of the cells which thus force water into the xylem. Root pressure shows itself most strikingly in the spring before the leaves are fully developed, when the sap often exudes from wounds, as in grapevines and many trees, in considerable quantities. After the development of the foliage and under conditions which permit transpiration (q.v.), root pressure becomes less

or disappears. It is, therefore, not an important factor in lifting water when water is most needed. The amount of water which may escape is often much greater than the volume of the root system. Thus, in two and a half days, the stump of a stinging nettle gave off over eleven liters

APPARATUS TO MEASURE ROOT PRESSURE. t, T-tube attached to stump of plant, filled with water and closed by sealing in flame the tip of c. m, mercury pressure gauge connected with t, registering the force with which water is forced from the stump. s, a support.

(11 quarts) of water,* more than eight times the volume of the root system. A twelve-year old birch in seven days exuded from an opening in the trunk 36 liters of water. When the central bud is cut out, various species of century plant exude water several months. A vigorous plant is said by Humboldt to yield as much as 1000 liters. The extrusion of water from the sugar maple in late winter or early spring is at first not due to root pressure, but rather to the expansion of gases in the twigs which are warmed during the sunny days. See SAP.

ROOT TUBERCLES. Irregular swellings upon the roots of Leguminosae, the alder, and a few other plants. They are due to an infection by various bacteria, or bacteria-like organisms. The ability of plants to assimilate the free nitrogen of the air was a subject of discussion among agricultural chemists for many years. Georges Ville seems to have been one of the first to maintain that certain plants can so assimilate, but he did not discover the true explanation. The claim of Ville was attacked by Boussingault, Lawes and Gilbert, and others, whose experiments seemed to give opposite results. Later Hellriegel (q.v.) proved, by carefully conducted experiments, that clovers and similar crops enrich the soil by adding nitrogen to it and that they obtain this nitrogen from the air, and subsequent studies show that the bacteria gain entrance through the root hairs. The action is reciprocal; the plant furnishes the carbohydrates necessary for the growth of the bacteria, which

to supply nitrogen to the host plant. (See SYMBIOSIS.) In this way if the soil contains sufficient available nitrogen for the maximum development of the plant, few tubercles will be developed, but well supplied with soil organisms, tubercles will be developed in abundance. The failure of Boussingault and others to observe any increase in nitrogen was due either to the absence of the micro-organisms or to a large amount of available nitrogen in the soil, since the organism (*Bacillus radicicola*) is not always present in the soil. Two means for securing them have been developed. One, called soil inoculation, consists in scattering soil rich in these organisms over a field to be planted, and the other in the use of cultures of the organisms distributed on the seed or over the soil. This last method is in some ways preferable and has resulted in the commercial preparation of a 'nitrogen.' See CLOVER; LEGUMINOSÆ; GREEN MANURING; NITROGEN.

ROPE (AS. *rāp*, Goth. *raips*, OHG. *reif*, cord, Ger. *Raf*, ring; of uncertain etymology). Technically, cordage one inch or more in diameter. The term cordage is used in a collective sense to include all sizes and varieties of cords and rope from harvester twine to the largest cables. It is probable that rope-making was among the very earliest of human industries. The materials first used for the purpose were probably the fibres of various plants, the inner bark of trees, and the hides of animals cut into thongs and twisted together. Sculptural representations of rope-making are found upon ancient Egyptian manuscripts, showing that they made use of flax and the fibres of the date tree as well as of rawhide. Herodotus states that the Persians manufactured cables 28 inches in circumference of flax and papyrus with which to aid in constructing the bridge of boats upon which the army of Xerxes crossed the Hellespont. Peruvians used fibres of the magney for rope and twisted cables of sufficient strength to carry the primitive suspension bridges.

Prior to the year 1820, hand labor, aided only by the clumsy wheels and other imperfect contrivances pertaining to the old-fashioned rope-walk, was exclusively employed in the manufacture of rope. In that year some machines were constructed in England for twisting hand-spun yarn into strands, and a few were imported into the United States. The next step was the introduction of machines for spinning the threads from the raw material. The first machinery for this purpose was constructed in Massachusetts in 1834. American machines are now extensively employed in Europe, and American cordage is held in such high estimation that it is exported to all parts of the world.

MATERIALS. The materials employed for rope-making include hemp, flax, cotton, manila, sisal, jute, and other vegetable fibres. Russian hemp for tarred rigging has long maintained a reputation for superiority; its great strength and durability are attributed to the method of retting the fibre under water in lieu of the mode usually adopted with American hemp, called dew-retting. Italian hemp is also of excellent quality, and for some uses is unsurpassed. Manila hemp is perhaps more extensively used in the manufacture of cordage than any other material, as its great pliability and strength particularly adapt it for

the running rigging of vessels and for a multiplicity of ordinary uses. Russian and American hemp are preferred for standing rigging, because they will absorb a great amount of tar and will withstand the weather without shrinking or stretching. Sisal, from Yucatan, and East Indian jute, are largely used for the manufacture of the cheaper grades of cordage. See FLAX; HEMP; JUTE; SISAL.

ROPE-WALK ROPE-MAKING. The old walk was usually from 1,000 feet to 1,400 feet long. Fibres of hemp were barked or straightened out by drawing the material through a steel-toothed comb. The workman then wound a bundle of hemp about his body, attaching one end to one of a series of hooks on a 'whirl' or looper, drawing out the fibres from the bundle with one hand and compressing them with the other, experience teaching the number of fibres to draw out and how to twist them so as to hold firmly to the hook. He then walked slowly backward down the walk, making his yarn as he went, the spinning being done by the wheel or 'whirl' turned by an assistant, the spinner seeing that the fibres were equally supplied and joining the twisted parts at the ends. Two or more spinners might be going down the walk at the same time and at the end two would join their yarns together, each then beginning a new yarn and returning on the walk to the end where the second spinner again took his yarn off the 'whirl' and joined it to the end of the first spinner's yarn, so that it continued on the reel. When a sufficient number of yarns were spun they were twisted into strands and the strands into ropes, horse power being usually employed.

A CABLE-LAID ROPE.

The next improvement was the introduction of machines for twisting the yarn into strands and laying the strands into cables. The nature and operation of these machines can best be explained by describing a modern rope-walk plant, the reader taking care to remember, however, that, at first, hand-spun yarn was employed instead of the present machine-spun yarn. Most large rope, such as towing lines and ship cables, is walk-laid rope. The first operation is to wind the yarn on large bobbins. These bobbins are put on a framework of wood located near one end of the

rope-walk and the ends of the yarns from them are passed through holes in an iron gauge plate, known as the face plate, and then through a cast-iron tube, which acts to collect the separate yarns into a closely laid cylindrical bundle. After being passed through the tube the yarns are fastened on a hook of the forming machine, which runs on a track the entire length of the walk, and which at the same time twists the yarns left-handed into a strand. To lay these strands into a rope, two laying machines are required, one at each end of the walk, which are known as the upper and lower machines. As many of the strands as are required for the rope are stretched at full length along the walk and are attached to the hooks on the laying machines. The upper machine has but one hook, to which all the strands are attached and which operates in one direction; while the lower machine has as many hooks as there are strands and operates in the opposite direction. To keep the strands equidistant they are placed in the grooves of a conical wooden block called a 'top,' which is attached to an upright post on a car called a top-stud. The top is pushed up close to the upper laying machine at the beginning of the twisting process, and, as the twisting proceeds, the strands closing in behind it gradually force it down the walk until the lower laying machine is reached and the rope completed.

MACHINE ROPE-MAKING. The greater part of medium-size rope is made by rope-making machines, as distinguished from the rope-walk. In describing rope-making by machines reference will be had particularly to the working of Manila hemp, the material most extensively used, but Russian, Sisal, and other hems are manipulated in essentially the same manner. The treatment of jute requires a rather different process, owing to its shorter and weaker fibre. The bales of Manila hemp, averaging in weight about 270 pounds each, are opened, and, after the fibre has been lightly shaken apart, it is placed in layers which are sprinkled lightly with oil to soften and to lubricate the fibre previous to its passage through the machines. The first mechanical operation is called 'scutching,' and consists in passing the hemp over revolving cylinders bristling with sharp steel prongs or teeth, which straighten out the fibres and remove the coir, or fine broken particles, the dirt, and other foreign substances. It is then passed on to the breakers, which are large frames each about 25 feet long, consisting of two endless chains covered with long steel pins. The first chain feeds the fibres to the second, which runs much slower, the effect being to comb or straighten out the fibres and draw them into a continuous ribbon or sliver. Following this operation comes the passage of the hemp through the spreaders and drawing frames, machines similar to the breakers, but smaller, and furnished with steel pins and teeth of gradually increasing fineness, which still further comb and straighten out the fibres—a number of slivers being put together behind each machine and drawn down to one sliver again at the end of each machine. This drawing is repeated several times through machines of various degrees of fineness, in order to make the sliver even, without which it would be impossible to spin fine even yarns. This process is completed on a very fine drawing frame called a

finisher, and from this the material emerges in complete readiness for spinning. The spinning is done on spinning machines or bennies, each operating two spindles, moving at about 1500 revolutions per minute. The spinning twists the fibre right-handed into yarn, about 1000 yards of which are wound upon each bobbin. The next process is to 'form' the yarn into strands and 'lay' the strands into rope, and this is performed upon machines known as formers and layers. For the larger sizes of rope there are usually separate machines, but for rope $\frac{1}{2}$ inch in diameter and less the former and layer are combined into a single machine. The former consists of a circular iron disk, at the centre of which is erected a perpendicular shaft, carrying at its end a 'head' or die. The plane of the disk may be either horizontal or vertical. Around the edge of the disk are spaced several bobbins or spools full of yarn, the number of spools used depending upon the number of yarns in the final strand. The free end of the yarn from each spool is carried to the head, where, by a revolving motion of the disk, they are twisted together and wound off on to a spool or drum. If we substitute for the spools of yarn just described spools filled with twisted strands we have in its essentials a layer. When former and layer are combined, each spool on the large disk is replaced by a small disk and head, which twists a strand, the several strands being led to the head of the main disk and there twisted into completed rope, which is wound off onto a drum or reel.

SPECIAL ROPES. Cables for drilling oil and water wells have to be made unusually long and run all the way from 1,400 feet to 3,500 feet in length, and from $1\frac{1}{8}$ inches to $2\frac{1}{2}$ inches in diameter. They are composed of three strands of manila ropes, laid together with a very hard lay, so that they will not untwist when used for drilling, and also will resist the continual wear and rubbing against the side of the casing and the wall of the well. Cables of this kind are always made on machines and not in the rope-walk. These machines have to be exceedingly large and heavy to carry this amount of rope, and only a few mills in the world are equipped for making well-drilling cables. For making tarred rope the yarns are first run through copper tanks filled with heated tar; the yarns enter through holes in an iron plate and are drawn through the tank by machinery. As the yarns emerge from the tank the superfluous tar is removed by means of pressing rollers. Tared rope may be made any size by the methods already described, but a large proportion of tared yarn is made into small cordage.

STRENGTH OF ROPE. The strength of rope varies with the material of which it is made, the weight of the rope per fathom, etc. The following figures compiled from Kent's *Mechanical Engineer's Pocket Book* (New York, 1900) give some general information on this matter:

MATERIAL	Circ. in inches	Weight lbs. per fathom	Strength, lbs.
Untarred hemp	1.33 to 6.9	0.42 to 7.77	1,670 to 33,898
Tarred hemp	1.44 to 7.42	0.58 to 10.39	1,946 to 31,549
Cotton rope	2.18 to 6.51	1.08 to 8.17	3,089 to 23,258
Manila rope	1.19 to 8.9	0.2 to 11.4	1,280 to 65,790

The comparative strength of hemp, iron, and steel ropes is indicated in a general way by the

following figures from Weisbach: Girth required to give tensile strength of 40 tons: Hemp, 12 inches; iron, 4½ inches; steel, 3¾ inches.

For a description of the manufacture of wire rope, see WIRE AND MANUFACTURES OF. For details of the strength and efficiency of rope and its application to transmission of power, see Kent, *Mechanical Engineer's Pocket Book* (New York, 1900), and Flather, *Rope Driving* (New York, 1895).

ROPES. ARTHUR REED (1859—). An English author best known for his comic operas. He was born in London, studied at King's College, Cambridge, and was Lightfoot and Whewell scholar in 1883 and fellow of King's from 1884 to 1890. He lectured on history at Cambridge and wrote a *Short History of Europe* (1889). He edited *Lady Mary Wortley Montagu's Letters* (1893), besides several modern language texts for the Pitt Press Series. Ropes's first comic opera, *Faddimic*, was produced in 1889. His other productions, entire or in part, include libretti for *Joan of Arc* (1891), *Go Bang* (1894), *A Greek Slave* (1898), *San Toy* (1899), *The Messenger Boy* (1900), and *The Tormentor* (1901).

ROPES. JOHN CODMAN (1836-99). An eminent American lawyer and military historian. He was born in Saint Petersburg, Russia, where his father, a prominent Boston merchant, lived for some time; graduated at Harvard in 1857 and at the Harvard Law School in 1861; and in the latter year was admitted to the bar. In 1865 he became associated in practice with John C. Gray; from 1866 to 1870 was one of the editors of the *American Law Review*; and from 1878 until his death was head of the law firm of Ropes, Gray & Loring. Though an able advocate, he devoted himself largely to the care and management of trust estates. He early became interested in military history; founded the Military Historical Society of Massachusetts in 1876; and gained a wide reputation as a military historian. Besides a number of magazine articles, he published: *The Army Under Pope* (1881), in the "Campaigns of the Civil War Series;" *The First Napoleon* (1885); *The Campaign of Waterloo* (1892-93), probably the ablest monograph yet published on that subject; and *The Story of the Civil War* (2 vols., 1894-98), which was left unfinished, but is generally regarded as the best account yet produced of the military operations of 1861 and 1862 in the United States.

ROPEWAY. A line of rope or steel cable in which a carriage with grooved wheels is supported and carries a load. This carriage, with its burden, may be moved either by power or by gravity and the device is frequently employed in mining and other operations, especially for crossing valleys. Ropeways have been in use since the early part of the nineteenth century, but the idea is now more generally applied in the cableway (q.v.), where a load is not only transported, but is hoisted from any point on the line and delivered at any other desired point. Telpherage (q.v.) is also a further adaptation of the same principle.

ROPS. FÉLICIEN (1833-98). A Belgian etcher, painter, and lithographer, born at Namur. His first drawings appeared in 1855, in the *Crocodile*, a Brussels publication, and a year afterwards he founded *Ulyssespiegel*, in which several of his best lithographs were published.

After this he was employed mainly in illustrating novels, and the cynical spirit, rare imagination, and often erotic subjects of these drawings have made his name widely and in many cases unfavorably known. His works rank with the highest for breadth, concentration, and sheer technical skill. His series of etchings known as the *Sataniques* are remarkable productions. His other works include several water colors. Consult: Ramiro, *Catálogo descriptif et analytique de l'œuvre gravé de Félicien Rops* (Paris, 1887-91); and Thijsmans, *Certains* (Paris, 1887).

ROQUE. See CROQUET.

ROQUE. RÔK, SAINT. See ROCII, SAINT.

ROQUEFORT. RÔK'fôr'. A village in the Department of Aveyron, France, famous for its enormous production of cheese made from the milk of goats and sheep, and matured in the rocky caves of the Larzac cliffs (Map: France, J 8). Population, in 1901, 937.

ROQUETTE. RÔK'két', OTTO (1824-96). A German poet, born in Krotoschin, Posen, of French descent. He studied at Heidelberg and Halle, and taught in the Darmstadt Polytechnic Institute from 1869 to his death. His first book was his greatest success, an allegoric tale in verse, *Walpurgis's Brautfahrt* (1851), which reached more than sixty editions before his death. Among his other poems, none of which approached the *Brautfahrt* in popularity, mention may be made of the *Liederbuch* (1852; 3d ed. 1880), which is in the Anacreontic manner; *Hans Haidekuckuck* (1885; 4th ed. 1894); and *Cesario*, a volume of narrative verse (1888). Besides several novels and dramas, Roquette wrote a *Geschichte der deutschen Litteratur* (1862-63; revised 1882). Consult the autobiography, *Siebzig Jahre* (Darmstadt, 1893).

RORAIMA. RÔ-râ'é-mâ, MOUNT. A remarkable mesa or flat-topped mountain-block situated at the common boundary point of Venezuela, Brazil, and British Guiana (Map: Brazil, E 2). From a sloping talus at the base the perpendicular rocky walls rise to a sheer height of nearly 3000 feet, though a sloping ledge on one side enables an ascent to be made to the summit, which has an altitude of 8740 feet above the sea. Several streams rise on the summit, and fall over the edges, forming the highest cascades in the world, the water being blown into a fine spray long before it reaches the ground.

RO'RER. SARAH TYSON (1849—). An American author, born at Richboro, Pa. She was educated at the East Aurora, N. Y., Academy, and became principal of the Philadelphia School of Domestic Science. She was editor and part owner of *Table Talk* from 1886 until 1892, and was an editor of *Household News* from 1892 until 1897, when she joined the staff of the *Ladies' Home Journal*. Her published works include: *Mrs. Rorer's Cook Book; Canning and Preserving; Bread Making; How to Use a Chafing Dish; and Good Cooking*.

RORIC FIGURES (from Lat. *ros*, dew). Images produced by breathing on glass or other polished surfaces which have been covered by some object. Moser of Königsberg, in 1842, discovered that when two bodies are in close proximity they receive impressions of each other's images, or, if a smooth surface has been touched by another body, it acquires a property of pre-

evaporating vapors, which, by their action, cause an impression which gives to the surface a different appearance. These roric figures are called by the Germans *Hauchbilder*, or breath figures. Hunt and others have produced similar effects by heat. Gold, silver, and bronze coins and medals were placed on a polished heated copper-plate. After cooling, the coins or other objects were removed and the plate exposed to the vapor of mercury. The parts which had been covered by gold and silver coins gave the most distinct impressions, the gold more than the silver. These phenomena are explained by the fact that there is a molecular change in the surface in consequence of its having been for some time exposed to different external circumstances. Consult Müller-Pouillet, *Lehrbuch der Physik* (Brunswick, 1886).

RORQUAL (either from Swed. *rörhval*, round-headed cachelot, from *rör*, teal, *ryrr*, Goth. *caus*, OHG. *ror*, Ger. *Rohr*, reed + *hvalr*, teal, *hvalr*, OHG. *wal-fisc*, Ger. *Wal-fisch*, AS. *hwal*, Eng. *whale*, or from Norw. *reyðhrhval*, red whale, from teal, *raupr*, Goth. *raups*, OHG. *rot*, Ger. *rot*, AS. *read*, Eng. *red* + *hval*, whale). A whale of the family Baleenoptera, which includes whalebone whales of large size, differing from the right whales in the comparatively small head, the presence of a dorsal fin, and the fact that the throat is deeply ridged and furrowed lengthwise. The baleen is short. Many species of rorqual are known in various oceans, including the largest of known whales, such as Sibbald's, or the 'blue' whale, which reaches a length of 85 feet, the finner, the humpback, and the California gray whale, all of which are elsewhere described. The northern rorqual or razorback (*Baleenoptera musculus*) is a slate-gray, whitish beneath. It is found in the Arctic seas. It is not easily captured; and whalers dislike it, because the Greenland whale is seldom found near it, while its own value is very inferior, owing to the comparative thinness of the blubber, and the shortness and inferior quality of the whalebone. It is, however, an important object of pursuit to the Laplanders and Greenlanders. This rorqual does not feed so exclusively on small prey as does the Greenland whale. Its gullet is much wider, and it preys much on fishes, the shoals of which it follows into bays and estuaries, devouring them in multitudes. Consult authorities cited under WHALE.

RO'RY O'MORE'. A novel by Samuel Lover (1836). Rory, a racy Irish peasant, cares for a sick French officer about the last of the eighteenth century, and is intrusted with important dispatches. On this errand he is involved in a fracas, and hurried off to France. He returns to find himself accused of murder, and is about to be hanged when his supposed victim appears. Lover also wrote a ballad on Rory O'More.

ROSA, rō'zà, CARL (1842-89). A German violinist and impresario, born at Hamburg. He studied in the conservatories of Leipzig and Paris; was concert-meister at Hamburg (1863-65), and on a tour of the United States in 1867 married Euphrosyne Parepa, the famous soprano. Together they formed an opera company, with Madame Rosa as its prima donna, which gave a great number of successful performances both in this country and in England. The Carl Rosa opera company was important principally for its creditable presentations of foreign operas in English.

ROSA, EDWARD BENNETT (1861-). An American physicist, born in Rogetsville, N. Y., and educated at Wesleyan University, where he graduated in 1886, and at Johns Hopkins. He was appointed professor of physics in Wesleyan, made an especial study of electricity, and was associated with Professor Atwater of Wesleyan in experiments on the conservation of human energy in which a new and large form of respiratory calorimeter was employed. His publications include *The Specific Inductive Capacity of Electrolytes* (1892) and *Descriptions of a New Respiratory Calorimeter* (with Atwater, 1899).

ROSA, SALVATOR (1615-73). An Italian painter, etcher, satirical poet, and musical composer, the chief master of the Neapolitan School of Painting. He was born near Naples, June 20, 1615, the son of an architect. He studied music and poetry, before taking up painting under his uncle, Paolo Greco, and his brother-in-law, Fraanzano, a pupil of Ribera, whose school Salvator afterwards also frequented to study figures. Before he was eighteen he wandered about sketching in the mountainous regions and along the shores of South Italy, often falling in with the banditti, who appear so frequently in his pictures. Soon after his return to Naples the death of his father threw the support of the family upon his shoulders, and he painted small pictures at low prices until they attracted the attention of Lanfranco. He now also won the friendship of Falcone, the "Oracle of Battles," under whose instruction Salvator learned to paint battle scenes. In 1635 he went to Rome and found a patron in Cardinal Brancaccio, for whom he decorated his palace at Viterbo, returning thence to Naples. The favorable reception of his "Prometheus" (Palazzo Corsini) at Rome induced him to repair once more (1639) to the Eternal City, where he rapidly acquired fame as a poet, musician, and painter, and where his house became the gathering point of an admiring circle of young scholars, artists, and Church dignitaries. The story of his participation in the insurrection of Masaniello at Naples in 1647, and of his joining Falcone's "Compagnia della Morte," deserves little credence, although the fact of his presence in Naples at the time seems established. After another sojourn of four years in Rome, he incurred the enmity of the Inquisition by two satirical pictures, "Human Futility" and "Fortune," and accepted the invitation to the grand ducal Court at Florence, where he spent nine years, enjoying with other friendships that of Lorenzo Lippi, in whose pictures Salvator painted the landscapes. He finally returned to Rome and remained there until his death, March 15, 1673.

The great ambition of Salvator Rosa was to excel as an historical painter, and some of his pictures, such as the "Conspiracy of Catiline" (Palazzo Pitti, Florence), "Saul and the Witch of Endor" (Louvre), the "Purgatory" (Brera, Milan), and "Jonah Preaching at Nineveh" (Copenhagen Gallery), go far to justify his aspiration. But his chief power lay in painting landscapes, marine views, and battle scenes, an admirable example of the latter being in the Louvre. His genius for landscapes was self-taught and original, preferring such subjects as the lonely haunts of wild beasts and robbers, rocky precipices and gloomy caves; his trees are shattered or torn up by the roots and the at-

in, though itself of a cheerless hue, only occasionally lighted up by a solitary sunbeam. Excellent specimens of this kind are "Mercury and the Dishonest Woodman" and "Forest Scene with Tobias and the Angel," both in the National Gallery, London. In his marines, of which a good example is the unique "Stormy Sea" in the Berlin Museum, he followed the same taste. He displays greater merit in landscapes of smaller dimensions, like those in the Gallery of Augsburg. In other works the landscape becomes subordinate, and the figures form the principal subject, a favorite theme being a "Warrior Doing Penance," of which the Vienna Museum contains a fine example. The "Selva dei filosofi," in the Palazzo Pitti, Florence, is of the same class. In his later Florentine period the influence of Claude Lorrain seems traceable in a few summer harbor views, exemplified by the large and splendid "Coast Scene" in the Palazzo Colonna, Rome. Salvator also painted excellent portraits; his own is in the Uffizi and in the Palazzo Pitti, Florence, and in the Dresden Museum, and he introduced it also into several of his pictures, notably in the "Poet and Satyr," in the Palazzo Chigi, Rome, and in the "Battle," in the Palazzo Pitti. He produced about ninety spirited etchings after his own designs. For his life, consult: Baldinucci (Venice, 1830) and Ignazio Cantù (Milan, 1844); also Regnet, in Dohme, *Kunst und Künstler Italiens*, iii. (Leipzig, 1879).

ROSA'CEA. See ACNE.

ROSA'CEÆ (Neo-Lat. nom. pl. of Lat. *rosaceus*, made of roses, from *rosa*, rose), or ROSE FAMILY. An order of at least 90 genera and 2000 species of dicotyledonous herbs, shrubs, and trees, chiefly natives of the cooler parts of the Northern Hemisphere, and among which are many species of great usefulness and beauty. It embraces the most important fruits of temperate climates, as the apple, pear, plum, peach, blackberry, raspberry, strawberry, and many ornamental plants such as rose, spiræa, mountain ash, etc. The fruit is various, as a drupe, pome, follicle, an achenium, a heap of achenia, or of one-seeded berries, etc. The order, as generally limited, is divided into a number of suborders, several of which have by some botanists been elevated to the rank of distinct orders, as Amygdaleæ, Pomaceæ, Sanguisorbeæ. The classification into suborders and chief genera as adopted by Engler is as follows: *Spiræoideæ*—represented by Spiræa, Quillaja, Holidiscus; *Pomoideæ*—with Pyrus; *Rosoidæ*—Rhodotypos, Kerria, Rubus, Potentilla, Fragaria, Geum, Dryas, Parshia, Urtaria, Agrimonia, Poterium, and Rosa; *Venardoideæ*—Nerada; *Prunoidæ*—Prunus, Nuttalia; *Chrysobalanoidæ*—Chrysobalanus, Hirtella. In addition to the grouping here given the genera are arranged in a dozen or more tribes. See ROSE; RUBUS; STRAWBERRY; AGRIMONY; SPIRÆA.

ROSALES. rô-sâ'lás. A town of Luzon, Philippines, in the Province of Pangasinán, situated on the Agno River, 24 miles southeast of Lingayén (Map: Luzon, D 3). Population, 11,519.

RO'SALIND. (1) The name under which Spencer, in the *Shepherd's Calendar*, refers to his early love, Rose or Rosa Daniel, who married John Florio. She is called Mirabel in the *Faerie Queene*. (2) In Shakespeare's *As You Like It*, the daughter of the banished Duke. She is herself banished, and, assuming male attire,

lives with a companion in the Forest of Arden until Orlando meets her.

RO'SAMOND (c.1140-c.1176). The mistress of King Henry II. of England, usually known as FAIR ROSAMOND. She was the daughter of Walter de Clifford, and Henry II. seems to have first entered into relations with her about the year 1174. Little is really known about her, for the tale that she was secreted in the palace of Woodstock and that Queen Eleanor found her there and poisoned her is of late origin. She probably died in the nunnery of Godstow, in Oxfordshire. It is said that she had two sons by Henry II., William Longsword, Earl of Salisbury, and Geoffrey, Archbishop of York, but there is no proof of this. Late chronicles tell that she was buried before the altar in the church of Godstow, but that in 1191 Hugh, Bishop of Lincoln, caused the body to be removed to the chapter house and there reinterred.

ROSARIO, rô-sâ'rê-ô. A city of Argentina, in the Province of Santa Fé, situated on the west bank of the Paraná, 175 miles northwest of Buenos Ayres, and 214 miles above that city along the river (Map: Argentina, E 10). It is substantially built, and has wide streets traversed by several lines of street railways. The chief importance of the city lies in its commerce. It is the centre of a considerable railroad system, and is the principal port and outlet for the products of all the northern provinces of the Republic. The river is navigable to this point for vessels drawing 16 feet, and transatlantic steamers load directly at the wharves. There are grain elevators. The chief exports are wheat, hides and other agricultural and cattle products, metals, and ores. These were valued in 1900 at \$28,436,000, while the imports amounted to \$9,301,000. Besides river craft, 682 ocean vessels with an aggregate of 1,027,353 tons entered the port in 1900. Rosario is the second city in size in the Republic. It has grown up almost entirely during the last half century. In 1850 it was an insignificant village of about 3000 inhabitants. In 1895 its population was 94,025, and in 1900, 112,461.

ROSARIO. A town of Luzon, Philippines, in the Province of Batangas. It lies about 12 miles northeast of Batangas and is connected by highways with all the larger places of the province (Map: Philippine Islands, F 6). Population, in 1896, 12,435. During the insurrection against the United States the town was completely destroyed by the insurgents.

ROSARY OF THE BLESSED VIRGIN MARY (ML. *rosarium*, garland of roses, chaplet of beads, neu. sg. of Lat. *rosarius*, relating to roses, from *rosa*, rose). The name given to a very popular form of prayer in the Roman Catholic Church. The name rosary has been variously traced either to the title "Mystical Rose," one of the titles under which the Blessed Virgin is addressed in the litany of Loreto (q.v.), or to Saint Rosalia's wreath of roses, well known in sacred art, or to the beads being originally made commonly of rosewood. The origin of the devotion itself is popularly traced to Saint Dominic, but it is quite certain that its characteristic feature, the use of beads as a means of reckoning the number of repetitions of a certain prayer, is of far greater antiquity. (See BEAD.) The same use of beads exists among the Mohammedans, but it

SALVATOR ROSA
A MARINE PAINTING IN THE PITTI GALLERY - FLORENCE

appears quite certain that the practice existed among Christians before the time of Mohammed. Originally, the prayer so repeated was the Lord's Prayer; but when, in the eleventh and twelfth centuries, the angelical salutation, "Hail Mary!" etc., became a frequent form of prayer, it was added to "Our Father"; and it seems beyond all doubt that the rosary in its present form was, if not devised, at least fully introduced and propagated by Saint Dominic. The repetition of these short and simple prayers is supposed to be accompanied by meditation on specific mysteries of the Christian faith, of which fifteen are named, though only five are usually taken up at one time. When recited publicly, the prayers are repeated alternately by the priest or other person presiding at prayer and by the congregation. The first Sunday in October is observed as the Feast of the Most Holy Rosary.

The mechanical instrument, so to speak, of this devotion is also called by the name rosary. It consists of a string of beads, equal in number to the "Our Fathers" and "Hail Marys" which are recited in the rosary—the "Our Father" beads being of a larger size—one of which is passed through the fingers at each recitation of the prayer, and thus secures the person praying from errors of memory. The beads are blessed for the use of the people by the Pope, by bishops and superiors of religious Orders, and by others having special power for the purpose.

ROSAS, rō'sás, JUAN MANUEL (1793-1877). Dictator of the Argentine Confederation. He was born at Buenos Ayres and grew up among the gauchos on his father's estates. He entered the army, identified himself with the Federalist Party, and in 1829 rose to be Governor or Captain-General of his native State, then in federal union with Entre Ríos, Corrientes, and Santa Fé. The predominant position which Buenos Ayres occupied among the Argentine States made Rosas the virtual head of the confederation. In 1832 he resigned, in order to conduct the war against the Indians, and was succeeded by Balcarce, who after three years was deposed. In 1835 Rosas caused himself to be invested with extraordinary powers in Buenos Ayres, and made himself dictator of the Argentine Confederation. He carried on relentless war against the chiefs of the party of the Unitarios, who favored a strongly centralized government, and against them, as well as all who opposed him, he did not hesitate to employ the weapons of torture and assassination. His sanguinary measures, however, gave the country peace, and with peace it attained to a fair degree of prosperity. The other States became jealous of the growth and power of Buenos Ayres, and Rosas was justly accused of a design to extend and uphold the undue predominance of his State, and to give his native city a monopoly of the trade of the river Plata. To extend his influence over Uruguay, which was a hotbed of opposition to him, he took up arms in behalf of Oribe (q.v.), and besieged Montevideo for a long period (1842-51). England and France interfered and in 1845 captured the Argentine fleet; yet Rosas succeeded in 1849 in obtaining terms of peace which were favorable to him. Finally Urquiza, Governor of Entre Ríos, made war on Rosas and with the aid of the forces of Corrientes, Brazil, and Uruguay marched against him. A battle ensued at Monte-Caseros, February 3,

1852, in which Rosas's forces were put to flight Rosas fled to England, where he died.

ROS CELINUS, ROUSSELIN, rōs cel'īnus (1008-1087) or **RUCELIN**, JUAN (c.1000-?). A French philosopher, the virtual founder of Nominalism. It is probable that he was born in Brittany, and was educated at Soissons and Reims. He entered the Church and became canon at Compiègne, where he enunciated the doctrine that abstracts and universals are non-existent, being mere terms or names. Eric of Auxerre had held the same view three centuries before, and Martinus Capella in the fifth century practically installed Roscelinus, who, applying his theory to the Trinity, arrived at a tritheistic concept. In 1092 he was tried at Soissons and forced to recant after a discussion with Anselm, whom he had claimed as an ally. He lived for some time in England, then returned to France, became the teacher of Abelard, and charged his pupil with heresy when he not only failed to support his teacher's position in regard to the Trinity, but declared strongly for the orthodox views. Consult Picavet, *Roscelin, philosophe et theologien* (Paris, 1896).

ROSCHER, rō'shër, WILHELM (1817-94). A German economist, founder of the historical method in political economy. He was born in Hanover, studied in Göttingen and Berlin, became professor in the former university in 1843, and in 1848 was called to a chair in Leipzig. His *magnum opus* was a *System der Volkswirtschaft* in five volumes (1854-94), of which the first, which went through twenty-one editions during Roscher's life, was translated into English by Lalor (1878) under the title *Principles of Political Economy*. The second deals with agriculture and forestry; the third with trade and commerce; the fourth with finance; and the fifth with charities. This great systematic treatise was supplemented by the *Geschichte der Nationalökonomie in Deutschland* (1874) and by the monograph *Zur Geschichte der englischen Volkswirtschaftslehre* (1851-52). Roscher's other writings include: *Ueber Kornhandel und Teuerungspolitik* (3d. ed. 1852); *Kolonien, Kolonialpolitik und Auswanderung* (3d. ed. 1885); *Ansichten der Volkswirtschaft aus dem geschichtlichen Standpunkt* (3d. ed. 1878); *Politik* (1892); and, posthumously published, *Gesammelte Gedanken eines Nationalökonomens* (1894).

ROSCHER, WILHELM HEINRICH (1815-?). A German classical mythologist, son of the economist Wilhelm Roscher. He was born in Göttingen, studied there and at Leipzig, and taught in the gymnasium at Wurtzen, where he became rector in 1894. He traveled widely and became one of the foremost authorities on Greek and Roman mythology, winning especial notice by his treatment of myths of natural forces. He wrote: *Studien zur vergleichenden Mythologie der Griechen und Römer* (*Apollon und Mars*, 1873; *Juno und Hera*, 1875); *Das Naturmysterium der Griechen und Römer* (1875); *Herms der Windgott* (1878); *Die Gorgonen* (1879); *Scheu und Verwunderliches* (1890 and 1895); and *Ephialtes* (1900). Even more important is the *Ausführliches Lexikon der griechischen und römischen Mythologie* (1884 et seq.) under his editorial charge.

ROSCIAD, rôsh-t'ad (from Lat. *Roscius*, name of a famous Roman comedian). THE. A satire in verse by Charles Churchill (1761) on the London actors of that day. All but Garrick, Mrs. Pritchard, Mrs. Cibber, and Mrs. Clive were severely handled.

ROS'CIUS, QUINTUS (?-B.C. 62). The greatest comedian in ancient Rome. He was born at Solonium, a village near Lanuvium. Many of the Roman aristocracy befriended him, and the dictator Sulla, as a token of favor, presented him with a gold ring, the symbol of the equestrian order. Among his most admiring and affectionate patrons Roscius also numbered Cicero, who, at the commencement of his career, received lessons in the art of elocution from the great comedian. So sensible was Roscius of the distinction he enjoyed in sharing the intimacy of the great orator, that he came to look upon his art as one of no small importance and dignity, and wrote a treatise on the comparative methods and merits of eloquence and acting. Cicero's friendship was of use to him in another way, for on his being sued at law by C. Fannius Chærea for the sum of 50,000 sesterces (about \$2000), Cicero defended him before the judex Piso (probably B.C. 68) in his extant oration *Pro Q. Roscio Comodo*. He died B.C. 62.

ROS'COE, SIR HENRY ENFIELD (1833—). An English chemist, born in London, grandson of William Roscoe, the historian. He studied at the University of London and at Heidelberg, where, in association with Bunsen, he published several memoirs on chemical subjects. He was made professor of chemistry in Owens College, Manchester, in 1858, and Fellow of the Royal Society in 1863. He was one of the first to make exact measurements of the chemical action of light; for this and other valuable scientific achievement, he received, in 1873, the Royal Medal of the London Society. In 1896 he was made vice-chancellor of the University of London. Dr. Roscoe's published works include: a text-book entitled, *Lessons in Elementary Chemistry*, which has passed through many editions and been translated into several foreign languages; *Lectures on Spectrum Analysis* (1869; 4th ed. 1885); *John Dalton and the Rise of Modern Chemistry* (1895), etc. Jointly with Schorlemmer he published an exhaustive *Treatise on Chemistry* in 8 volumes (1877-98 and a later edition). He was one of the editors of Macmillan's series of Science Primers and himself wrote the *Primer of Chemistry*.

ROSCOE, WILLIAM (1753-1831). An English historian, born near Liverpool. In 1769 he entered the office of a Liverpool attorney, and in 1774 he began the practice of law. Meanwhile he diligently studied the classics and the Italian language and literature. In 1777 he published a collection of his verse, containing the first protest against the slave-trade, of which, throughout his life, he was a strenuous opponent. In 1796 was published the first volume of his *Life of Lorenzo de' Medici*. Called *the Magnificent*. This work proved very popular; several English editions appeared, and it was translated into German, French, and Italian. In 1805 appeared his second great work, the *Life and Pontificate of Leo X.* This work was received with much commendation, though its tone and spirit, espe-

cially with reference to the Reformation, was severely criticised. During the later years of his life he devoted himself much to the study of botany, and in honor of him a rare genus of monandrian plants received in 1826 the name *Roscoea*. Consult Henry Roscoe, *Life of William Roscoe* (London, 1833).

ROSCOE, WILLIAM CALDWELL (1823-59). An English poet and essayist. He graduated from the University of London (1843) and was called to the bar (1850). Owing to ill health, he soon retired to Wales, but he kept up his literary connection in London. His critical essays were written mostly for the *National Review*, edited by his brother-in-law, R. H. Hutton. They are still of interest. After experimenting with a drama called *Eliduc* (1846), founded on a *lai* of Marie de France, Roscoe produced a fine study in Elizabethan tragedy, *Violenzia* (1851), and wrote considerable occasional verse, some of which is beautiful. His finest powers are seen in the sonnet "To My Mother." Consult his *Poems and Essays*, with memoir by Hutton (London, 1860), and the reissue of the poems by his daughter, Elizabeth M. Roscoe (*ib.*, 1891).

ROSCOM'MON. An inland county of Connaught, Ireland, bounded on the east by the river Shannon (Map: Ireland, C 3). Area, 949 square miles. The surface, which belongs to the central plains of Ireland, is level, with undulations rising in the south and on the north. The principal rivers are the Shannon (q.v.) and the Suck. The soil is fertile in the central district, which is known as the 'plain of Boyle' and which is celebrated for its sheep. Some portions produce good cereal crops; but the chief industry of the Roscommon farming population is the feeding of sheep and cattle, especially the former. The capital is Roscommon (q.v.). Population, in 1841, 254,550; in 1851, 174,570; in 1891, 116,552; in 1901, 101,640.

ROSCOMMON. The capital and assize town of Roscommon County, Ireland, 16 $\frac{1}{2}$ miles west-southwest of Longford (Map: Ireland, C 3). Population, in 1901, 1891.

ROSCOMMON, WENTWORTH DILLON, fourth Earl of (c.1633-85). An Irish poet. He was born in Ireland and was the son of the third Earl of Roscommon and nephew of the Earl of Strafford. After the impeachment of his uncle he was sent to Caen, Normandy, where he was educated at the Protestant university. After the Restoration he held various Court positions, married a daughter of the Earl of Burlington, and devoted himself to literature. His works, commended by Johnson, and praised by Pope as the only pure writings of a dissolute reign, include an *Essay on Translated Verse* (1660); *Horace's Art of Poetry Translated into English Blank Verse* (1684); paraphrases of various psalms; a translation of *Dies Ire*, and a collection of prologues and epilogues to plays. He was buried in Westminster Abbey.

ROSE (AS. *rōsc*, from Lat. *rosa*, from Gk. *ῥόδον*, *rhalon*, Æolic *ῥόδον*, *bralon*, rose; connected with Av. *raro da*, plant, Pahlavi *rartā*, Pers. *gul*, rose), *Rosa*. The popular name for a genus of plants of the natural order Rosaceæ, consisting of more or less erect climbing or trailing woody shrubs with odd-pinnate leaves. The flowers, borne solitary or in

corymbs, are generally 'rose-colored.' In its natural state and in 'single' garden varieties the rose has five petals. The species, of which there are about 180, or according to some botanists only 30 or 40, are in some cases not well distinguished from varieties. Roses are natives of all the temperate parts of the Northern Hemisphere and thrive even in some of the colder regions. They have long been among the chief favorites in flower gardens. Countless single and double flowered varieties have been produced by cultivation by crossing and variation. These may be divided into two large classes, summer roses, or those blooming but once each year, usually in early summer, and perpetual or autumnal roses, which bloom more than once during the same season, many of them producing flowers continuously from early summer until late in the fall.

The summer roses include the Provence, damask and French, alba, Ayrshire, brier, multiflora, evergreen, and pompon garden groups. The Provence group consists of large-flowered varieties with a branching or pendulous growth and wrinkled leaf, and includes the moss, pompon, and sulphurea forms. The damask and French group presents firm and robust growing plants producing large flowers and downy leaves. This group includes the hybrid French, hybrid Provence, hybrid Bourbon, and hybrid China roses. The varieties of the alba group are large-flowered, have a free growth, and are spineless. The leaf is characterized by a whitish upper surface. The other groups of summer roses have small-flowered double or single blossoms. The Ayrshires are climbing varieties producing their flowers singly. The briars generally have a short-jointed growth and include the Austrian, Scotch, sweet, and Penzance briars, and the prairie and the Alpine roses. The multiflora group has a climbing growth and produces its flowers in clusters. This group includes some of the polyantha varieties. The evergreen group, including the sempervirens, Wichuraiana, Cherokee, and Banksian roses, is distinguished by its more or less shiny and persistent foliage. The pompons, as the name indicates, are of a dwarf growth.

In the summer and autumn flowering class the large-flowered groups comprise the hybrid perpetual, hybrid tea, moss, Bourbon, Bourbon perpetual, and China roses. All except the China group, which includes the tea and Lawrenceana varieties, have rough foliage. The small-flowered groups in this class include the musk, Ayrshire, polyantha, perpetual brier, and evergreen roses. The musk rose group, to which the noi-ettes belong, and the Ayrshire and polyantha groups have deciduous foliage and climbing habit. The perpetual briars, including the rugosa, lucida, microphylla, berberidifolia, and Scotch roses, are dwarf and bushy. The evergreen group in this class comprises the Macartney and Wichuraiana forms, in which the foliage is more or less persistent. The rose succeeds in warm, sunny, protected spots in most soils, but a friable, well-manured deep soil with a permeable sub-soil is best adapted to the production of vigorous plants. Hybrid perpetuals prefer a strong, rich clay or loam, while tea roses are often grown in gravelly and sandy soil. Good drainage is always necessary. Roses are propagated from seeds, buds, layers, cuttings, and grafts. New varieties are

grown from seeds. The most common method of propagation is by cuttings from nearly mature shoots which are started in sand under glass with low bottom heat. In budding the cultivated varieties are budded on manetti and multiflora stocks which are specially grown for this purpose in Europe. For grafting the stock used is *Rosa Watsoniana*, a Japanese species. Pruning in rose culture is practiced for the purpose of removing the dead wood, giving the plant a symmetrical form, and encouraging the development of flower buds.

Rose-growing under glass has become a very important industry. The three quarter span rose house extending from east to west with the long span to the south is most in use. A moderately stiff loam taken from an old pasture, well rotted and pulverized, and mixed with about one fourth its bulk of well-decomposed cow manure, makes a good soil for indoor rose culture. The benches should be four inches deep and well drained. The plants are generally kept in position by being tied to supports. The surface of the soil is very lightly stirred to kill all sprouting weed and grass seeds. Sometimes a light mulch of three or four parts of well-rotted cow manure and one part of soil is applied in August and again in January. During hot weather the temperature of the house is lowered by syringing several times a day and by the use of the ventilating arrangements. Ventilation is very beneficial and should be given whenever the weather permits. Propagation by cuttings is readily accomplished in rose houses because the conditions are all under control. Various varieties seem to require slightly different treatment, especially with respect to temperature. Such differences make necessary the separation of certain varieties. More than 100,000,000 cut roses are sold annually in the United States.

The influence of climate on rose culture is apparently greater than the influence of soil. A mild sunny climate is most favorable. The pleasant climatic conditions of Cannes and the Riviera in Europe and of southern California have made rose culture in those regions famous.

In landscape gardening the rose has a narrow range of application, since few species and

SWAMP ROSE, (*Rosa Carolina*).

varieties retain their foliage well enough to be valuable in picture composition. The tree growing un-supported bushy forms are, however, often trained as pillars and the climbing sorts over

trellises, walls, arches, arbors, etc. But it is as a cut flower that the rose is eminent; it is far more useful for personal adornment and house-decoration than for beautifying the garden.

ROSE, DISEASES. Among the diseases occurring on roses grown outdoors are: Leaf blight (*Actinomyces rosae*), which produces black enlarging spots upon the upper surfaces of the leaves, which turn yellow and fall; leaf-spot (*Cercospora rosicola*), which forms dark red or nearly black spots with distinct grayish-brown centres as they grow older; mildew (*Sphaerotheca pannosa*), which checks the growth of the young shoots and dwarfs the leaves, while a white powdery growth covers the leaves and stunts the plants; and rust (*Phragmidium mucronatum*), which attacks all the green parts of the plant, causing reddish or yellow spots which increase in size until the leaves fall off. All diseased parts should be collected and burned and the plants well sprayed throughout the season with a clear fungicide (q.v.). Of these diseases, leaf blight and mildew occur in green-houses, and may be treated with powdered or evaporated (not burned) sulphur.

Consult: Bailey, *Cyclopaedia of American Horticulture* (New York, 1900-02); Ellwanger, *The Rose* (ib., 1893); Hole, *A Book About Roses* (London, 1894); Jekyll and Mawley, *Roses for English Gardens* (ib., 1902); Hatton, *Secrets of Rose Culture* (Huntington, N. Y., 1891). A list of books in different languages on roses and their culture is given by Vergara in *Bibliografía de la rosa* (Madrid, 1892).

ROSE, ORDER OF THE. A Brazilian civil and military order of merit with six classes, founded in 1829 by Dom Pedro II. The medallion on the six armed cross of white enamel bears the initials P. A. with the inscription *Amor e Fidelidade*; on the reverse are the date of foundation and the names *Pedro Amalia* in reference to Pedro's marriage with Princess Amalie of Leuchtenberg. The ribbon is pink with two white stripes.

ROSE, CHAUNCEY (1794-1877). An American philanthropist, born in Wetherfield, Conn. He removed to the West in 1817 and settled in Terre Haute. He was active in promoting many industrial enterprises, chief among which was the building of the Indianapolis and Terre Haute Railroad. Having come into possession of his brother's estate, of the value of about \$1,600,000, he resolved to carry out his brother's wishes expressed in a defective will by devoting the money to philanthropic enterprises. He gave large sums both from this estate and from his own fortune to schools, hospitals, asylums, and other charities in New York, Terre Haute, and elsewhere. His chief benefaction was made to the Rose Polytechnic Institute at Terre Haute, which he organized in 1874.

ROSE, GEORGE (1817-82). An English humorist who wrote under the pseudonym "Arthur Sketchley." He was born in London. After receiving his degree from Magdalen College, Oxford, in 1848, he took orders in the Anglican Church. In 1855 he went over to the Church of Rome. From 1858 to 1863 he was tutor to the Duke of Norfolk. Turning to literature, he produced several light comedies, which met with success. He became widely known for his numerous monologues on current topics purporting to be the views of Mrs. Brown, an illiterate old

woman. They bore titles such as "Mrs. Brown's Visit to the Paris Exposition" (1867), on "The Alabama Claims" (1872), and on "Home Rule" (1881). They were begun in *Routledge's Annual* (1866), and continued in *Fun*. Rose traveled round the world, reading from these monologues. As a result of a visit to the United States (1867) he published the next year *The Great Country*. He also wrote two novels, *A Match in the Dark* (1878) and *A Marriage of Conscience* (1879). He died in London, November 11, 1882.

ROSE, ROZCE, GUSTAV (1798-1873). A German mineralogist, born in Berlin. He was a brother of Heinrich Rose, and, like him, studied in Berlin, and under Berzelius in Stockholm. He was appointed curator of minerals in the museum of Berlin University in 1822, professor in 1826, and director of the Mineralogical Museum in 1856. Rose accompanied Humboldt through Siberia in 1829, and, with Mitscherlich, examined Vesuvius and Etna in 1850 and the extinct volcanoes of Southern France in 1852. He attempted to show a close relationship between electrical polarity and crystal form, and therefore urged that the formation of crystals was in no way causally connected with physical surroundings. This system is set forth in his *Krystallochemisches Mineralsystem* (1852). His other works include: *Elemente der Kristallographie* (1833); continued by Sadebeck and Websky; *Beschreibung und Einteilung der Meteoriten* (1864); and *Kristallisation der Diamanten* (1876).

ROSE, HEINRICH (1795-1864). A German chemist. He was born in Berlin. He studied chemistry in Berlin, in Stockholm under Berzelius, and in Kiel, and became professor in Berlin in 1823. He devoted himself to analytical chemistry, and may be considered its founder. He made especial study of the rarer elements, was first to isolate many substances, and in 1844 discovered the metallic element niobium or columbium. Rose made valuable contributions to Poggendorff's *Annalen* and wrote a standard *Handbuch der analytischen Chemie* (1851, and after). Consult the biography by Rammelsberg (Berlin, 1866).

ROSE, HUGH HENRY, Baron Strathmairn. See STRATHMAIRN.

ROSE, HUGH JAMES (1795-1838). A Church of England theologian, and one of the founders of the Tractarian movement. He was born near London, at Little Horsham, educated at Trinity College, Cambridge; ordained deacon in 1818 and priest a year later; and became in 1818 curate of Buxsted, Sussex, and in 1821 of Horsham, Sussex; prebendary of Chichester, 1827-33; rector of Hadleigh, Suffolk, 1830, and of Fairstead and Werley in 1833, leaving the last for Saint Thomas, Southwark, 1837. In 1833 he was made professor of divinity in the University of Dublin, but ill health compelled his resignation the next year; in 1836 he became principal of King's College, London, but again ill health shortened his service, and he left England in October and died in Florence. He published *Christianity Always Progressive* (1829), *Notices of the Mosaic Law* (1831), *The Gospel an Abiding System* (1832). He was a fine Greek scholar; but his memory survives rather from his association with the great leaders of the Oxford Movement (q.v.) in its earlier stages. Consult his biography in Burgen, *Lives of Twelve Good Men* (London, 1888).

ROSES

COPYRIGHT, 1913, BY BIRD, MEAD & COMPANY

1 MAËCHA, NIE...
2 MME. DE NAT...
3 A. FRAN...

ROSE, Sir JOHN (1820-88). A Canadian statesman, born at Turriff, in Aberdeenshire, Scotland. He was educated in King's College, Aberdeen, and in 1836 emigrated to Lower Canada. In 1842 he was admitted to the bar in Montreal, quickly gained a large practice, and in 1848 was made Queen's counsel. In 1864 he was commissioner on behalf of Great Britain for the settlement of claims arising out of the Oregon treaty with the United States. Three years later he was returned to Parliament, and was Minister of Finance from that year until 1869, when he removed to England. In 1870 he was sent by the British Government to Washington on a mission relative to the *Alabama* claims. His efforts resulted in an informal convention, out of which grew the famous Treaty of Washington. He was created a baronet in 1872, and in 1886 became a privy councillor.

ROSE, JOHN HOLLAND (1855—). An English historian. He was born at Bedford and studied at Owens College, Manchester, and at Christ College, Cambridge. He graduated (B.A.) at Cambridge in 1879, and became lecturer on modern history to the Cambridge and London Societies for University Extension. Aside from numerous articles in the *English Historical Review* and the *Monthly Review*, his more important publications are *The Revolutionary and Napoleonic Era* (1894), *The Reign of Queen Victoria* (1897), *The Rise of Democracy* (1897), and *Life of Napoleon I., Including New Materials from the British Official Records* (1902), the last being up to the time of its publication the best balanced and most satisfactory life of Napoleon in English.

ROSE, JOSEF VALENTIN (1829—). A German classical philologist and paleographer; son of Gustav Rose. He was born in Berlin, studied there and at Bonn, and at twenty-six entered the employ of the Berlin Royal Library, in which he became head of the department of manuscripts. He published a list of the Latin manuscripts in this library (1893, 1901 et seq.). He edited many classical works, especially on medicine, either before unedited or lacking critical treatment of the text. Among these are *Aristoteles Pseudepigraphus* (1863; 3d ed. 1886), *Anecdota Græca et Græcolatina* (1864-70), *Vitruvius* (with Müller-Strübing, 1867; 2d ed. 1899), *Anacretæa* (2d ed. 1876), *Anthimus* (1877), *Cassius Felix* (1879), and *Soranus* (1882).

ROSE, WILLIAM STEWART (1775-1843). An English poet and translator. He was educated at Eton, obtained a seat in Parliament (1796), and the position of reading clerk of the House of Lords (1800). Coming under the influence of the romantic revival, he published a verse translation of the first three books of *Amadis of Gaul* (1803), not directly from the Spanish original, but from Herberay's French version. The same year he made the acquaintance of Sir Walter Scott, who visited him at his villa of Gurdimore on the Hampshire coast, and addressed to him the first canto of *Marmion*. In 1807 appeared a translation from the French of *Partenopex of Blois* and a ballad entitled *The Red King*, which were followed by two other ballads, *The Crusade of St. Lewis*, and *King Edward the Martyr* (1810). In 1817 Rose settled in Venice, where he began his well-known translation of Ariosto's *Orlando Furioso* (1823-

31, reissued in Bohn's Library, 1858). His last publication was a volume of *Rhyme* (1837).

ROSEBERY, ARCHIBALD PHILIP PRIMROSE, fifth Earl of (1817—). An English statesman. He was born in London, and was educated at Eton and at Christ Church, Oxford. He left college in 1808 before graduating, and took his seat in the House of Lords, having succeeded to the Earldom of Rosebery on the death of his grandfather, Archibald John Primrose. In Parliament he allied himself at once with the Liberal Party, and became an ardent supporter of Gladstone. In 1878 his marriage to Hannah Rothschild, daughter of Baron Rothschild, brought him powerful and influential friends in the financial world. In the same year he was made lord rector of Aberdeen University, and in 1880 he was chosen lord rector of the University of Edinburgh. In August, 1881, he accepted his first official appointment, that of Under Secretary of State for Home Affairs under Sir William Vernon Harcourt. His identification with the Gladstone Administration terminated in 1885, however, when he resigned as a result of the hostile criticism of some members of his party who objected to a peer holding such an office. Toward the end of 1881 he accepted the post of First Commissioner of Works, with a seat in the Cabinet. He left office with his colleagues in June, 1885. In the short-lived Ministry of Gladstone, which began in February, 1886, he held the office of Secretary of State for Foreign Affairs, and exhibited in the administration of that department unusual ability and skill. The years spent out of office succeeding the fall of the Gladstone Ministry Lord Rosebery spent in travel and study, adding greatly to his reputation as an orator and political leader. In 1888 he received the degree of LL.D. from Cambridge, and in 1889 was elected a member and the first chairman of the London County Council, holding office until June, 1890, and again for a few months in 1892. During a retirement in 1891, following the death of Lady Rosebery, he completed his *Life of William Pitt*, in the "Twelve English Statesmen" Series. Upon the return of Gladstone to power in August, 1892, Lord Rosebery again became Foreign Secretary. The principal features of his foreign policy were his insistence on British control in the Upper Nile Valley and Uganda, and his advocacy of the friendly policy subsequently adopted by Lord Salisbury in regard to the growth of the Japanese power in the Far East. In March, 1894, on the retirement of Gladstone, Lord Rosebery became Prime Minister. His personal popularity, however, did not avail to maintain his Ministry, and on June 21, 1895, the Government was defeated. On October 8, 1896, Lord Rosebery, finding himself opposed to the foreign policy generally adopted by Gladstone and other former leaders of the party, formally resigned his leadership. In the succeeding years he adopted the policy of "plowing his furrow alone" as he phrased it, holding aloof from Liberal politics. He supported Salisbury's stand in the Fashola incident, and the prosecution of the war in South Africa, although as the war progressed he bitterly criticised its conduct, and urged the necessity of radical army reform. In addition to his *William Pitt* his principal published writings are: *Speeches, 1874-96* (1896); *Sir Robert Peel*

(1899); *Napoleon: the Last Phase* (1900); *Questions of Empire* (1900).

ROSECRANS, rō'ze-krānz, WILLIAM STARKE (1819-198). A distinguished American general, born at Kingston, Ohio. He graduated at West Point in 1842, entered the United States Engineer Corps, and served for a year as assistant to Colonel De Russey at Fortress Monroe. He then returned to West Point, where he served until 1847 as an assistant professor. In 1854 he resigned from the army and settled in Cincinnati, where he engaged in business as an architect and civil engineer. Upon the outbreak of the Civil War he was appointed colonel of the Twenty-third Ohio, and in June, 1861, became a brigadier-general in the Regular Army. He took part in General McClellan's West Virginia campaign as commander of a brigade of Ohio and Indiana troops, and on the 12th of July, 1861, won the battle of Rich Mountain. Shortly afterwards, when General McClellan was summoned to Washington, Rosecrans was put in command of the Federal forces in western Virginia. With them, on September 10th, he routed General Floyd at Carnifex Ferry; thus clearing the Kanawha Valley of the Confederates. In the following year he commanded the right wing of the Army of the Mississippi in the advance on Corinth, fought the battle of Inka, September 19, 1862, and in October successfully defended Corinth against Generals Van Dorn and Price. On the 26th of the same month he relieved General Buell as commander of the Army of the Cumberland. He advanced upon Nashville, and on December 31st and January 2d defeated General Bragg in the battle of Murfreesboro, or Stone River. In the following June he moved into East Tennessee, and on September 19th and 20th was defeated by Bragg in the battle of Chickamauga (q.v.). The Federal army then fell back to Chattanooga, where it was besieged until relieved by General Grant. On October 23d Rosecrans was succeeded by Thomas, and after a short period of service in charge of the Department of Missouri he was relieved of all command. Concerning his military ability there has been much controversy. The weight of opinion, however, inclines to the view that "notwithstanding some faults of temper and military vacillation, General Rosecrans was undoubtedly a splendid fighter and a good strategist." Up to the time of the unfortunate battle of Chickamauga he had been uniformly and even brilliantly successful. At the close of the war he resigned from the army; in 1868 he served as Minister to Mexico; and from 1869 until 1881 devoted himself to railroad and industrial enterprises, mainly in Mexico. He was elected to Congress in 1880 and again in 1882, as a Democrat, and served as chairman of the Committee on Military Affairs. From 1885 to 1893 he was Register of the United States Treasury. In 1889 Congress passed an act restoring him to the rank and pay of a brigadier-general. For an account of his military campaigns, consult: Bickhorn, *Rosecrans's Campaign with the Fourteenth Army Corps* (Cincinnati, 1863); Cist, *Army of the Cumberland* (New York, 1882); Van Horne, *History of the Army of the Cumberland* (Cincinnati, 1875); Johnson and Buel (eds.), *Battles and Leaders of the Civil War* (New York, 1887); and Fiske, *The Mississippi Valley in the Civil War* (Boston, 1900).

ROSE FAMILY. See ROSACEÆ.

ROSEFISH, or REDFISH. A red scorpionid fish (*Sebastes marinus*) abundant on both coasts of the North Atlantic, and far into polar latitudes, where it becomes a shore and surface fish, while south of Newfoundland it is only found off shore and in deep water. In Greenland, Labrador, Iceland, and Scandinavia it is an important food-fish. In Nova Scotia it is called 'John Dory;' among various other names are 'snapper' and 'hemdurgan.' This fish is about 18 inches long and orange red in color, with a few dusky bars across the back. Consult Goode, *Fishery Industries*, sec. i. (Washington, 1884). See Plate of ROCKFISH, SUNFISH, ETC.

ROSEGGGER, rō'zég-ĕr, PETER (1843-). An Austrian novelist, known for his descriptions of Styrian peasant life. He was born at Alpel, near Krieglach, in Styria. After a youth of poverty he was apprenticed at the age of eighteen to a tailor, but he gained by poetry patrons who enabled him to give himself to literature. *Zither und Hackbrett* (1870), poems in Styrian dialect, were well received and were followed by prose tales and sketches in dialect and in literary German. Of the latter the more noteworthy are *Volksleben in Steiermark* (1870), *Waldheimat* (1873), *Der Gottsucher* (1883), *Die Schriften des Waldschulmeisters* (1875), with an autobiographical preface, trans. as *The Forest Schoolmaster* by Francis E. Skinner, New York, 1901), *Jakob der Letzte* (1888), *Peter Mayr* (1893), *Erdscegen* (1900), and the autobiographic *Mein Welleben* (1897). A popular edition of his works appeared at Leipzig (1895-1900).

ROSE INSECTS. The rose is eaten by many insects wherever it occurs. In Europe about 100 species are recorded as occurring upon this plant, including seven beetles, 55 lepidopterous larvæ, and 25 sawflies and gall flies. In the United States it is probable that fully as many species will be found. The most important of the American forms is the rose chafer (*Macrodactylus subspinosus*), which makes its appearance about the time the roses begin to bloom and strips the bushes, as well as grapevines and other plants, of the blossoms and foliage. The beetle is about one-third of an inch long, and is of a light yellowish color. It appears suddenly and in vast swarms in certain years, and overruns gardens,

ROSE CHAFER.

Adult female beetle (*Macrodactylus subspinosus*).

vineyards, and orchards. In about a month or six weeks from the time of their first arrival, and generally after having done a vast amount of damage, the insects disappear as suddenly as they came. The range of the rose chafer is from Canada and Maine southward to Virginia and Tennessee, and westward to Oklahoma and Colorado. The best remedies consist in plowing and cultivating the soil in the most favored breeding

grounds, where these can be discovered. Against the adult beetles are used spraying with arsenical poisons, hand-picking, covering choice plants with netting, and the poisoning of early-flowering plants as trap crops; but the beetles appear in such enormous numbers day after day as to make these measures apparently hopeless.

The rose sawflies, larvæ of which are known as 'rose slugs,' frequently do considerable damage by skeletonizing the leaves. The bristly rose slug (larvæ of *Chadus pectinicornis*) has a wide distribution, feeding at first upon the lower side of the leaves and gradually eating irregular holes until nothing remains but the stronger ribs. They form their cocoons in the autumn, among fallen leaves and other rubbish upon the surface of the ground, and in the summer sometimes do so upon the branches of the plant. There are two or three generations annually. The curled rose slug (larvæ of *Emphytus cinctus*) is a European species which has been imported into the Northeastern United States. It eats the entire surface of the leaf, working along the edges, however, instead of gnawing holes. The American rose slug (larvæ of *Monostegeia rosea*) is the most prominent of the rose-sawfly larvæ. It is single-brooded, and the adults emerge in May about the time when the rose is in full leaf. The eggs are circular, and are inserted singly in the edge of the leaf. The larvæ is about one-third of an inch long, and is slug-like, the thorax being swollen. It feeds only at night and always upon the upper surface of the leaf, skeletonizing it rather than eating the entire substance. During the day it remains concealed on the under surface of the leaf. The larvæ becomes full-grown in about two weeks, abandons the plant and enters the soil, where it constructs a delicate earthen cocoon. In this it remains dormant until the following spring, transforming to pupa shortly before the emergence of the adult insect in May. All of these sawfly larvæ are readily destroyed by the application of powdered hellebore in a water spray.

The rose-bud worm is the larvæ of a tortricid moth (*Peuthina nimbatana*). It usually feeds upon the leaves, but frequently bores into rose-buds before they have opened. The parent moth appears in the spring and lays its eggs at night. The larvæ grows rapidly, feeding upon the leaves or the buds, and reaches full growth by the end of May, the moth appearing early in June. The eggs of a second generation are then laid, and in the Southern States there may be a third. Another tortricid moth, the oblique-banded leaf-roller (*Cacucia rosaceana*), is one of the most important of the leaf-rollers, and feeds upon many rosaceous plants. See LEAF-ROLLER.

Fuller's rose beetle (*Aramigus Fulleri*) is a weevil which feeds, when adult, upon the leaves, and in the larval stage works upon the roots. It is a well-known greenhouse pest of many plants in California, and made its appearance in the Eastern States as early as 1879. The adult beetle lays its eggs in flattened batches, thrusting them under the loose bark of the stem usually near the ground. The larvæ burrow into the ground and feed upon the roots, reaching full growth in the course of one or two months and passing the pupa stage also under the ground. The rose eucendro (*Rhynchites bicolor*) is abundant and destructive in certain of the Western

States; and several species of cutworms (q.v.) are also injurious to young rose plants.

Consult: Chittenden, *Bulletin* 27, new series, *United States Department of Agriculture, Division of Entomology* (Washington, 1901); also *Circular* 11, second series, (ib., 1895).

ROSELLA (Neo Lat. diminutive of Lat. *rosa*, rose), or ROSE PARRAKEET. A dealer's name, often spelled rosella, for one of the beautiful broad-tailed parakeets of Australia (*Platycercus amurus*), remarkable for its rose-red plumage. In this species, which is common in captivity, the head, neck, and breast are rose red, the cheeks white, the nape yellow, the feathers of the back black, with greenish-yellow borders, the lower breast yellow, with a scarlet band in the middle, the wings largely blue, and the hind parts and tail yellowish green. Its total length is 13.50 inches. It is distinguished from most other parrots by its cry, which is described as a kind of chattering or warbling.

ROSELLINI, rō'sel-lē'ne, ROSOLINO (1800-43). An Italian Egyptologist, born at Pisa. He studied at Bologna under Mezzotanti, and in 1821 was made professor of Oriental languages in the university of his native town. From 1826 he devoted himself chiefly to the study of Egyptology, and was the friend and pupil of J. F. Champollion, whom he assisted in his investigations at Rome, Naples, and Turin. In 1828 Rosellini was sent to Egypt at the head of a Tuscan expedition which, uniting with a French expedition under the direction of Champollion, spent fifteen months in exploring the monuments of Egypt and Nubia. The results of the expedition's work were published by Rosellini, after his return, in his *I monumenti dell'Egitto e della Nubia* (1832-44). Among his other works may be mentioned his *Elementa Lingue Egyptiacæ* (Rome, 1837), and his *Dizionario geografico*, which was left in manuscript, unfinished, at his death.

ROSELLY DE LORGUES, rō'sel-lō' de lōrg, ANTOINE FRANÇOIS FÉLIX (1805-). A French religious author, born at Grasse. He studied law at Aix and became an advocate, but deserted his practice to devote himself to literature. His chief publications are *Christophe Colomb* (1856), *Christophe Colomb le secrétaire de Dieu* (1884), *Satan contre Colomb* (1876), and *Histoire positive de Colomb* (1885), in which he claims that Columbus was directly inspired by God in his voyages, and that he should be canonized by the Roman Catholic Church. To this latter end he was made commissioner to the Holy See by the Queen Regent of Spain in 1893.

ROSEMARY (OF. *rosamarin*, *romarin*, Fr. *romarin*, from Lat. *rosmarinus*, *ros marinus*, rose-mary, sea-dew, from *ros*, dew, and *marinus*, marine, from *mare*, sea; influenced by popular etymology with *rosa maria*, rose of the Virgin Mary), *Rosmarinus*. A genus of plants of the natural order Labiate. Only one species is known, *Rosmarinus officinalis*, an erect evergreen shrub 4 to 8 feet high, with linear leaves and pale bluish flowers, growing in sunny places, on rocks, old walls, etc., in the Mediterranean region. It is generally cultivated as an ornamental and aromatic shrub. An essential oil, oil of rosemary, obtained from the leaves, is frequently used as a perfume and as a principal ingredient in Hungary water. Spirit of ros-

mary—made by distilling rosemary with rectified spirit, is used to perfume lotions and liniments. Wild rosemary is *Ledum palustre*.

ROSEN, rō'zen, FRIEDRICH AUGUST (1805-37). A German-English Orientalist. He was born in Hanover, was educated at Göttingen and at Leipzig, where he devoted himself to the study of Semitic languages, and in 1824 went to Berlin, where he studied Sanskrit under Bopp, and in 1827 published his *Rudices Sanscritæ*. He studied in Paris for a short time under De Sacy, and during 1829 and 1830 was professor of Oriental literature in University College, London. He translated and edited the oldest of extant Arabic mathematical works, *The Algebra of Mohammed ben Musa* (1831), during the next few years wrote a portion of the Oriental articles for the *Penny Cyclopaedia*, undertook the revision of the Sanskrit-Bengali dictionary of Sir Graves Haughton (1835), and compiled for the British Museum the Catalogue of Syrian Manuscripts (1839), which was published after his death. In 1836 he had been re-appointed professor of Sanskrit at University College and was busy preparing his collection of hymns of the *Rigveda*. Poverty and overwork hastened his end. His unfinished work on the Vedas was published by the Asiatic Society under the title *Rigveda-Sanhita, Liber Primus Sanscritæ et Latine* (1838).

ROSEN, GEORG (1820-91). A German Orientalist and historian, brother of Friedrich August Rosen. He was born in Detmold, studied in Berlin and in Leipzig, and having attracted the attention of the Prussian Government by his *Rudimenta Persica* (1842), was sent with Koch to the East (1844). For thirty years he was in the German consular service, at Constantinople, at Jerusalem, and, until 1875, when he retired to his native city, in Belgrade. He wrote: *Ossctische Grammatik* (1846); *Tutnamch*, a translation of a series of Oriental tales (1858); *Das Haram zu Jerusalem und der Tempelsplatz des Moria* (1866); *Geschichte der Türkei 1826-56* (1866-67); *Die Balkan-Haiduken* (1878); and *Bulgarische Volksdichtungen* (1879).

ROSENBERG, rō'zen-bērk, ADOLF (1850—). A German art historian, born at Bromberg, Posen. After graduating in philology and archaeology in Berlin, he studied art, traveling extensively, and in 1875 became associated with the editorial department of *Die Post* in Berlin. His writings comprise: *Schuld und Barthel Beham, zwei Maler der deutschen Renaissance* (1875); *Die Berliner Malerschule* (1879); *Rubensbrüder* (1881); *Die Münchener Malerschule* (1887); *Aus der Düsseldorfer Malerschule* (1890); *Geschichte der modernen Kunst* (2d ed. 1894); *Der Kupferstich in der Schule und unter dem Einfluss des Rubens* (1888). He also contributed largely to Dohme's *Kunst und Künstler* and to the series of monographs edited by Knackfuss. With Hugo Licht he published *Die Architektur Berlins* (Berlin, 1877) and *Die Architektur Deutschlands* (ib., 1878-82).

ROSENBUSCH, rō'zen-bōsh, KARL HEINRICH FERDINAND (1836—). A German mineralogist, the practical founder of scientific petrography. He was born in Einbeck, Hanover, and studied at Freiburg. He was professor at Strassburg and then went to Heidelberg. There he became head of the Geolog-

ical Institute in 1889. His great contributions to petrography have been a new classification and a wider use of the microscope. His chief works are *Mikroskopische Physiographie der Mineralien und Gesteine* (3d ed. 1892) and *Hilfstabellen zur mikroskopischen Mineralbestimmung in Gesteinen* (1888).

ROSENHEIM, rō'zen-him. A town in Upper Bavaria, situated on the Inn, 40 miles by rail southeast of Munich (Map: Bavaria, E 5). It has a number of interesting old churches and saline springs in the vicinity. Its chief manufactures are machinery, matches, cement, and metal articles. The trade is principally in wood. Population, in 1900, 14,246.

ROSENKRANZ, rō'zen-krānts, KARL (1805-79). A German philosopher, born at Magdeburg, and educated at Halle, where he subsequently was professor (1831-33). In 1833 he became professor at Königsberg. He belonged to the so-called 'centre' group of Hegelians. Besides his works in general literature he labored on a revision of Hegel's system. Among his works are *Psychologie* (3d ed. 1863); *Hegels Leben* (1844); *Goethe und seine Werke* (1847; 2d ed. 1856); *Die Poesie und ihre Geschichte* (1855); *Wissenschaft der logischen Idee* (1858-59). See Quäbicker, K. *Rosenkranz* (Leipzig, 1879).

ROSENTHAL, rō'zen-täl, ISIDOR (1836—). A German physiologist, born in Labischin, Prussia, and educated in Berlin. There he was assistant to Du Bois-Reymond in 1859-62 and docent in 1862-67. In 1872 he left the chair of physiology in Berlin to become professor at Erlangen, where he was long head of the Physiological Institute. He edited the *Centralblatt für die medizinischen Wissenschaften* (1869-80), the *Biologisches Centralblatt* (1881 sqq.), and the German edition of the "International Science Series" to which he contributed a volume, *General Physiology of Muscles and Nerves* (1881). His other works include: *Electricitätslehre für Mediziner* (1862); *Bier und Branntwein in ihrer Bedeutung für die Volksgesundheit* (1881; 2d ed. 1893); and *Vorlesungen über öffentliche und private Gesundheitspflege* (1887; 2d ed. 1889).

ROSENTHAL, MORITZ (1862—). An Austrian piano virtuoso, born at Lemberg. He studied under Karl Mikuli of Lemberg, Rafael Joseffy, and Franz Liszt. At the age of thirteen he gave concerts in Vienna, Warsaw, and Bucharest; but two years afterwards retired and studied at the University of Vienna. In 1882 he made successful concert tours throughout Europe, and in 1887 made his first tour of the United States, after which he achieved great success in the principal art centres of England, France, Germany, and Russia. In 1896-97 he made a second tour of the United States.

ROSENTHAL, TOBY EDWARD (1848—). An American figure painter, born in New Haven, Conn. He studied in San Francisco under Fortunato Arriola, and in Munich under Raupp and Piloty. Excepting occasional visits to America, he lived principally in Munich. His works are executed in a romantic, rather conventional style, with agreeable color. They include: "Morning Prayers in the Bach Family" (Leipzig Museum, 1870); "Trial of Constance de Beverly" (1882); "Elaine" (1876); and "Dancing Lesson During the Empire" (1886).

ROSENTHAL-BONIN, Hugo (1849-97). A German novelist, born in Berlin. After studying there and in Paris philosophy and the natural sciences, he traveled extensively as a merchant, then settled in Switzerland and in 1871 at Stuttgart, where he became associate editor of *Ueber Land und Meer* and in 1889-94 edited *Vom Fels zum Meer*. His best known novels include: *Der Bernsteinucher* (1880), *Die Thierhandigerin* (1884), *Schwarze Schatten* (1884), and *Das Haus mit den zwei Eingängen* (1888). The collections of stories *Der Heiratslaun* and *Anderes* (1876) and *Unterirdisch Feuer* (1879) were translated into most of the European languages.

ROSE OF JERICHO, RESURRECTION PLANT (*Nastatica hircocautiva*). A small Arabian herb of the natural order Cruciferae. After flowering the leaves fall off, and the branches become incurved toward the centre, so that the plant becomes almost globular. In this state it is often blown about by the wind. When it happens to be blown into water, the branches expand again, the pods open and let out the seeds. If taken up be-

ROSE OF JERICHO.
d. Dried condition.

fore it is quite withered, the plant retains for years its hygroscopic property of contracting in drought and expanding in moisture.

ROSE OF LIMA, SAINT (1586-1617). The first American saint. She was born at Lima, Peru, April 20, 1586, and from an early age gave herself to a life of extraordinary austerities and self-mortifications. At the age of 20 she took the veil as a sister of the Third Order of Saint Dominic. She died at Lima, August 24, 1617. In 1669 she was named patron of "America and the Indies," and was canonized by Clement X. in 1671. Her day is August 30. The chief source for her life is the *Vita Sanctae Rosa* by the Dominican Hensen (German trans., 2d ed., Regensburg, 1863).

ROSE OF SHARON. A name variously applied to the autumn crocus (*Colchicum autumnale*), to *Polygonum Narceissus* (*Narceissus Taceta*), and, in America, to the Syrian hibiscus (*Hibiscus syriacus*). See **CROCUS**; **NARCISSUS**; **HIBISCUS**.

ROSE'OLA (Neo-Lat., from Lat. *roseus*, rosy, from *rosa*, rose). A name given to an eruption accompanying several diseases, such as erythema

and German measles or rubella. There is a *roseola ab angustis* which is due to intestinal or gastric disturbances, and which resembles very closely the eruption of scarlet fever.

ROSE POLYTECHNIC INSTITUTE. A school of engineering at Terre Haute, Ind., founded in 1874 by Chauncey Rose (qv) and opened in 1883. Five parallel courses of study are offered, in mechanical, electrical, and civil engineering, architecture, and chemistry, each occupying four years. The five courses are identical during the first term of the freshman year, after which each student must elect between two groups. The degree of Bachelor of Science is conferred on all graduates, and that of Master of Science for at least one year's graduate work. The degree of Mechanical, Electrical, or Civil Engineer is granted to holders of the Master's degree, after two years in the practice of their profession. In 1903 there were 200 students and a faculty of 20 instructors. The institute occupies ten acres and has four buildings, valued with the grounds at \$185,000. Its library contained 11,000 volumes. The productive fund amounted to \$600,000, and the gross income was \$50,000.

ROSE QUARTZ. A variety of quartz, usually crystallized, but sometimes found massive. It has a delicate pink or flesh color, due to the presence of minute quantities of manganese or titanium oxide. It is valued as an ornamental stone, and the larger pieces are made into vases, while the smaller fragments are used for jewels, seals, etc. The variety possessing a bright red color is sometimes called 'Bohemian ruby.'

ROSES, WARS OF THE. The series of civil wars in England between the rival houses of Lancaster and York in the latter half of the fifteenth century. The struggle owed its name to the fact that the badge of the House of Lancaster was a red rose, and that of the House of York a white rose. The House of Lancaster had obtained the throne of England in 1399 by an act of Parliament, which had deposed Richard II and given the crown to his cousin Henry IV. During the reigns of Henry IV. and Henry V., there was no open discontent, for the country was prosperous and under the latter King the military successes in France pleased the national pride. But when Henry V. died in 1422 he left as heir a child of nine months, Henry VI., who, when he grew to manhood, proved to be weak physically and mentally. Moreover, the country was exasperated by the loss of the French possessions (see **HUNDRED YEARS' WAR**), and the poor were in dire distress on account of the excessive taxation. Under such circumstances the people began to look to Richard, Duke of York, who, descended from Lionel, the second son of Edward III, had, if hereditary right was to be regarded, better claims to the throne than Henry VI., descended from John of Gaunt, the fourth son of Edward III. The first armed demonstration was Jack Cade's Rebellion (1450), which began in Kent and was directed against the favorites of Henry VI. The chief demand of the insurgents was that the government should be placed in the hands of the Duke of York. This rising was easily suppressed, but in 1453 Henry VI. became insane, and in 1454 the Duke of York was declared Protector. Henry VI., however, soon recovered his reason, and

York, fearing destruction, took up arms. In general the North was Lancastrian, while the South (especially London) sided with the Yorkists. In 1455 the first battle of the war took place at Saint Albans. York was victorious, and when, shortly after, Henry again became insane, the Protectorate was reestablished. In 1456 the King recovered his reason and the Duke of York resigned. Meanwhile, however, the Earl of Warwick, the most powerful supporter of the Yorkists, continued in rebellion, until in 1460 the strife again became general. The royal army was defeated at Northampton and the King captured, and Parliament declared Richard heir to the crown, thus excluding Edward, the son of Henry VI. This last action aroused the Queen, Margaret of Anjou (q.v.), and she collected an army in the North. On December 31, 1460, the Duke of York was defeated and slain at Wakefield. His successor was his son, Edward, Earl of March, who on February 2, 1461, defeated some Lancastrian forces at Mortimer's Cross. Meanwhile Margaret was advancing on London, and on her way defeated Warwick in the second battle of Saint Albans on February 17th, and released Henry, who had been in Warwick's hands. Edward hastened to London, and on March 2, 1461, assumed the crown as Edward IV. On March 29th the decisive battle of Towton was fought. Edward was completely victorious, and Margaret fled with Henry to Scotland.

Since nearly all the great nobles were Lancastrians, Edward IV. sought to conciliate the Commons, and increased their privileges. The civil strife for a while went on in a desultory way. In 1462 Margaret was again in Northern England, but in 1464 Warwick's brother, Lord Montague, defeated her at Hedgeley Moor and Hexham, and in 1465 Henry was captured and thrown into the Tower. Suddenly in 1469 Warwick, hoping to obtain still greater power, deserted Edward IV. for Henry VI. His followers were defeated at Stamford, but Warwick fled to France, and there obtained aid from Louis XI., and with his new forces landed in England. Edward IV. escaped to Holland, and Henry VI. was taken from the Tower and replaced on the throne. But Edward soon returned and on April 14, 1471, won the battle of Barnet, in which Warwick and Montague lost their lives. On May 4th Margaret was defeated at Tewkesbury, and her son was slain after the battle, while shortly after Henry VI. was probably murdered in the Tower, whither he had been taken after the battle of Barnet.

The battle of Tewkesbury ended all effective resistance to the Yorkist rule until the reign of Richard III. (q.v.). His unpopularity enabled the Duke of Richmond, the head of the House of Lancaster, to invade England in 1485. On August 22, 1485, Richard III. was defeated and slain at Bosworth Field, and Richmond became King as Henry VII. (q.v.). On January 18, 1486, Henry married Elizabeth, the daughter of Edward IV. and heiress of the Yorkist family. Thus the rival dynasties were united. The chief results of the Wars of the Roses were the extirpation of the ancient nobility and the reduction of Parliament to the position of a tool of faction. This rendered possible the despotism of the Tudors. A good compendium of the whole subject will be found in Gairdner, *The Houses of*

Lancaster and York (6th ed., London, 1886). The fullest and best work is Ramsay, *Lancaster and York, 1399-1485* (Oxford, 1892). Consult also Kriehn, *The English Rising in 1450* (Strassburg, 1892).

ROSETTA, rô-zët'tá (Ar. *Er-Rashid*). A town and port of Northern Egypt, in latitude 31° 25' N., on the west bank of the Rosetta branch of the Nile, and about four miles from the mouth of the river. It is the modern representative of the ancient Bolbitine, which lay a little farther north. In the Middle Ages Rosetta was a place of considerable commercial importance, and it continued to flourish until the construction of the Mahmudiyyeh Canal and the improvement of the harbor of Alexandria diverted most of its trade to the latter city. Rosetta still has thriving manufactories of sailcloth, leather, and iron, and exports a considerable quantity of rice, linseed oil, and oil of sesame. The population numbers about 14,000. See ROSETTA STONE.

ROSETTA STONE. A slab of black basalt bearing an inscription which was the key to the interpretation of Egyptian hieroglyphics. It was found in 1799 by M. Boussard, a French officer of engineers in the trenches at Fort Saint Julien, near Rosetta (q.v.), and is now in the British Museum. The upper portion and the lower right-hand corner have been broken away and in its present condition it measures 3 feet 9 inches in height, 2 feet 4½ inches in breadth, and 11 inches in thickness. Upon it is inscribed in hieroglyphics, in demotic writing, and in Greek, a decree of the Egyptian priesthood, assembled at Memphis, in honor of Ptolemy V. Epiphanes (B.C. 205-181). It is dated March 27, B.C. 195, and, after reciting the numerous benefits conferred by Epiphanes upon his country as well as upon the temples and the clergy, provides that the King's statue shall be placed in the sanctuary of every temple, and that divine honors shall be paid to him. It is further provided that a copy of the decree, inscribed upon a stele of hard stone, shall be placed in every temple of the first and second rank. The Greek version of the decree, containing 54 lines of text, is well preserved, though the ends of some of the lines are broken away. Of the hieroglyphic inscription, 14 partly mutilated lines, constituting about half the text, remain, while the demotic text (32 lines) is almost entire. The Rosetta stone, by placing in the hands of scholars two long Egyptian texts, representing different periods of the language, together with a Greek translation, furnished the means whereby a knowledge of the long-lost tongue of ancient Egypt was regained, and thus opened the way for the great achievements of modern Egyptology. (For an account of the work of decipherment, see EGYPTOLOGY.) Another trilingual inscription, containing a similar decree in honor of Ptolemy III., Energetes I. (B.C. 247-222), was found at Tanis in 1866, and has served to confirm the methods and results of Champollion and his followers. Consult: Letronne, *Inscription grecque de Rosette* (Paris, 1840); Brugsch, *Die Inschrift von Rosetta* (Berlin, 1850); *Report of the Committee Appointed by the Philomathean Society of the University of Pennsylvania to Translate the Inscription on the Rosetta Stone* (Philadelphia, 1858); Chabas, *L'inscription hiéroglyphique de Rosette* (Paris, 1867); Sharpe, *Rosetta Stone in Hieroglyphics*

and Greek (London, 1871); Budge, *A History of Egypt* (New York, 1902).

ROSETTI, rō-sĕ'tĕ, KONSTANTIN (1816-84), A Rumanian poet and politician, born at Bucharest. He served in the army and was afterwards employed in the Government service, devoting himself at the same time to literary pursuits. Voltaire, Lamartine, and Byron were translated into Rumanian for the first time by him. He took a prominent part in radical agitation, was a member of the Revolutionary Committee in 1848, and held several public offices. In 1850 his journal, *Practical roman*, was suppressed. He was Minister of Education in 1866, became president of the Chamber of Deputies in 1877, and was Minister of Interior in 1881-82. During his last years he was editor of *Romanul*. He published one volume of original verse, *Căsuiri de multumire* (1840). His collected works appeared at Bucharest in 1885.

ROSE WATER. See PERFUMERY.

ROSE WINDOW. A large circular window, usually with tracery and stained glasses, used especially in Gothic churches over the portals. See WINDOW.

ROSEWOOD. The commercial name of the wood of several trees, valued for beauty, and used for ornamental furniture. The principal species is thought to be a Brazilian Mimosa. Several species of Dalbergia, of the natural order Leguminosæ, are also believed to be rosewoods, but in general the botanist is still doubtful, although various kinds of rosewood, imported from South America, are much used for veneering, in making furniture, musical instruments, etc. Rosewood has for a long time been second only to mahogany as a furniture-wood. It varies in color from reddish brown to purple or almost black, often beautifully marked with streaks of dark red. When being sawn or cut it yields an agreeable smell of roses, hence its name. The name rosewood has been given also to kinds of timber grown in Jamaica, in Africa, and in Burma. One valuable kind of rosewood is yielded by an East Indian tree, *Dalbergia latifolia*, also called blackwood. It is found chiefly in Malabar, and grows to a height of about 50 feet. The increasing value of the wood has led to the formation of new plantations, under the care of the Government conservator of forests, in several parts of the Madras Presidency. The value of rosewood depends upon its coloring, the usual price being from \$50 to \$90 per ton, though exceptional specimens have sold as high as \$450 per ton. The principal supplies come from Brazil, the Canary Islands, East Indies, and Africa. In Australia the name rosewood is applied to the timber of *Eremophila Mitchellii*, *Dysoxylum Frazerianum*, and *Acacia glaucescens*, all of which are close-grained, dark-colored, and pleasantly scented. The genera *Pterocarpus* and *Machærium* also supply rosewood.

ROSICRUCIANS (ML. *Rosicrucianus*, from Lat. *rosa*, rose + *cruc*, cross, Latinized from Ger. *Rosenkreutz*, Rose-Cross, the name applied to the society either on account of the emblem and pseudonym adopted by Johann Valentin Andrea, erroneously regarded as the founder or restorer of the order, or because of the titles 'Brothers of the Rosy Cross,' 'Rosy Cross Knights,' and 'Rosy Cross Philosophers,' assumed by the society;

sometimes supposed to be a corruption of *Rosii*, *cruciani* or *Rosicruciani*, from Lat. *rosæ*, dewy, from *ros*, dew + *crucis*, cross, since medieval alchemists considered dew the most powerful solvent of gold, and the cross the synonym of light). The members of secret societies, professing to be philosophers, but in reality emulcators, who in the seventeenth and eighteenth century made themselves conspicuous by claiming to be possessed of secrets of nature, including the power to transmute the baser metals into gold, to prolong life by the use of the *elixir vitae*, to have a knowledge of passing events in distant places, and to discover hidden things by the application of the 'Cabala' (q.v.). Rosicrucianism stood in some connection with freemasonry, and owed its vogue in the eighteenth century to the passion for secret associations and for a pseudoscience which had not yet freed itself from the absurdities of alchemy and found expression in such forms as mesmerism, etc. This was the age, too, of great impostors, who laid claim to supernatural powers, such as Cagliostro and the Count of Saint Germain (q.v.). See ANDREA, JOHANN VALENTIN.

ROSIN (variant of *resin*, OE. *resinc*, Fr. *résine*, from Lat. *resina*, resin, probably from Gk. *ῥητίνη*, *rhētīnē*, pine-resin), or COLOPHONY. A well-known substance which remains behind when common turpentine is subjected to distillation with water. It is hard and transparent, and has a faint odor like that of turpentine. It is soluble in alkaline hydroxide solutions as well as in alcohol, ether, and carbon disulphide. Its chief constituent is the anhydride of abietic acid. Colophony is used mainly in making varnishes and rosin soap, and is one of the constituents of basilicon ointment and of adhesive plaster. See RESINS.

ROSINANTE, rō'si-nān'tā. The lean, raw-boned steed of Don Quixote.

ROSIN WEED. See STURGEON.

ROSLAVL, rōs-lāv'ly'. A town in the Government of Smolensk, Russia, 73 miles southeast of Smolensk (Map; Russia, D 4). Its chief manufactures are oil and tobacco. Population, in 1897, 17,848.

ROSLIN, rōz'lin, **ROSLYN**, or **ROSSLYN**. A village of Edinburghshire, Scotland, overlooking the beautiful valley of the North Esk, 4½ miles southwest of Dalkeith. It is famous for its collegiate chapel, dating from 1450, and commemorated in Sir Walter Scott's ballad of *Rosabeth*. The chapel is one of the most profusely decorated specimens of Gothic architecture extant. It is now used as an Episcopal church.

ROSMINI-SERBATI, rōs-mī'ne ser-bā'te, ANTONIO (1797-1856). An Italian philosopher and founder of a religious Order. He was born at Rovereto, near Trent, in Tyrol. He became a priest in 1821 and in 1828 he founded a religious Order called the Institute of Charity, whose members, known as Rosminians, were to devote themselves especially to preaching and education. During the troublous times in 1848 Rosmini was an adviser of Pope Pius IX. He was in sympathy with the national idea and looked forward with enthusiasm to a united Italy. He was influenced by Gioberti (q.v.), who was at that time a member of the

Italian Ministry. With the rising influence of Cardinal Antonelli, Rosmini lost the favor of the Pope. His work on Church reform, called *The Five Wounds of the Church* (1848), and his tract *The Constitution Accorded to Social Justice* (1848), were put upon the Index. His works (which are published in 35 volumes) aroused much discussion. They have been translated into English by Thomas Davidson (London, 1882) with copious notes, full bibliography, and a well-written *Life*. "Objective idealism, subjective realism, and absolute moralism" is the description Mr. Davidson gives of the Rosminian doctrine. Rosmini's definition of morality as action controlled by absolute truth is the basis of his ethical teaching. His system of philosophy partakes somewhat of Kantianism. In psychology Rosmini was an ontologist: Everything is known in the idea of not actual but possible being, which is inborn; only the determinative details of knowledge are drawn from the senses. At the time of his condemnation by the Congregation of the Index in 1849, Rosmini at once submitted and retired to Stresa, on Lake Maggiore, and there he died. He was a man of exalted personal character. His industry was very great. At the time of his death he had already published thirty octavo volumes on abstruse philosophical and theological subjects and sixty volumes remain in manuscript. Besides the philosophical-theological works of Rosmini there are in English *The Ruling Principle of Method Applied to Education* (Boston, 1887), and *Maxims of Christian Perfection* (London, 1889). Consult: Stöckl, *Geschichte der neuern Philosophie* (Mainz, 1883); Werner, *Die italienische Philosophie des 19ten Jahrhunderts* (Vienna, 1884); Lockhart, *Life of Rosmini* (London, 1892); Paoli, *Della vita di Antonio Rosmini-Serbati* (Turin, 1880-84).

ROSNY, rô'né', BARON DE. Minister of Henry IV. of France. See SULLY.

ROSNY, JOSEPH HENRY (1856—). A French novelist. He was born in Paris and early became a member of the Naturalistic School. His first novel, published in 1885, after some time spent in London, was *Nell Horn*, a story of the Salvation Army. In it he struck the note he afterwards sounded more strongly, a simple representation of theorists and social reformers, especially those in the middle or lower classes. Possibly his masterpiece is *Le bilatéral* (1886), with its theme of French socialism in the early 80's, and a style of treatment approaching Zola. In 1887, with four others, he attacked the gross realism of Zola's *La Terre* and allied himself with the Goncourts. Beginning in 1891 he collaborated with his brother, Justin. His later titles are: *L'immolation* (1887), a story of life in the country; *La termite*, on literary life in Paris (1890); *Daniel Valguire* (1891); *L'impérienne laide*, dealing with Parisian charity (1894); *L'indompté* (1894), a powerful tale of a girl who studied medicine in Paris; *Le serment* (1896); dramatized (1897); *Les âmes perdues*, on modern nihilism (1899); and *L'héritage* (1902). In these contemporary novels, as well as in the "pre-historic" *Amirch* (1892), Rosny's characters are real and striking, without being minutely analyzed.

ROSNY, LÉON LOUIS LUCIEN DE (1837—). A French orientalist. He was born at Loos, studied

in Paris at L'École des Langues Orientales, was appointed professor of Japanese at the Bibliothèque Impériale, and in 1863 interpreter to the Japanese ambassadors at Paris, whom he accompanied to Holland, England, and Russia. He was appointed to the newly created chair of Japanese in his alma mater in 1868, in 1884 was decorated with the Legion of Honor, and in 1886 was nominated assistant in L'École des Hautes Études. Among his numerous pamphlets, text books, and original works, some of the more important are: *Introduction à l'étude de la langue japonaise* (1856); *Les écritures figuratives et hiéroglyphiques des différents peuples anciens et modernes* (1860); *Études asiatiques de géographie et d'histoire* (1864); *De l'origine du langage* (1869); *Extraits des historiens du Japon* (1874-75); *Les peuples orientaux connus des anciens Chinois* (1882); *Vocabulaire de l'écriture hiéroglyphique yucatèque* (1883); *Le livre sacré et canonique de l'antiquité japonaise* (1885); *Le pays de dix mille lacs, voyage en Finlande* (1886); *Taureau et mantilles: Souvenirs d'un voyage en Espagne et en Portugal* (1889); *Le Taoïsme* (1892).

ROSOLIC ACID (from *rose*), C₂₀H₁₆O₈. A red crystalline substance, melting above 270° C. It is insoluble in water, but dissolves in alkalis and in alcohol. Its alkaline solutions are colored red, while its alcoholic solutions have an orange-yellow color. It may be obtained by heating a mixture of carbolic acid and cresol with sulphuric acid and arsenic. Owing to the difficulty of fixing it, it is not much used as a dye. Chemically, rosolic acid is closely allied to aurin (q.v.), and its constitution is represented by the following formula:

ROSPIGLIOSI, rô'spê-lyô'zê, PALAZZO. A palace in Rome, built by the Cardinal Scipione Borghese in 1603 on the ruins of the Baths of Constantine, and afterwards the residence of the Rospigliosi family. It contains a number of art treasures, and is especially celebrated for Guido Reni's ceiling-painting "Aurora" (q.v.).

ROSS, ALEXANDER (1699-1784). A Scottish poet. He was educated at Marischal College, Aberdeen; acted as tutor and school teacher in several places, and in 1732 settled as schoolmaster at Lochlee, in Angus, where he remained until his death. He was all his life a writer of verses, but his only publication was *The Fortunate Shepherdess, a Pastoral Tale in the Scottish Dialect* (1768), which has a humorous preface by Dr. James Beattie, and contains several songs still popular in Scotland. Consult the edition under the title *Heleneore*, by J. Longmuir (1866).

ROSS, ALEXANDER (1742-1827). A British general, born in Scotland. He entered the army as ensign in 1760; served in Germany in the Seven Years' War, and attained the rank of captain in 1775 and that of major in 1780. He served through the American war as aid-de-camp of Lord Cornwallis and was the commissioner appointed by Cornwallis to arrange his surrender at Yorktown in 1781. In 1783 he became deputy adjutant-general in Scotland, served throughout the campaign of Cornwallis against Tipu Sahib in India, fighting in every battle, was promoted

colonel in 1793 and appointed governor of Fort George, and became general in 1812.

ROSS, ALEXANDER (1783-1856). A Canadian author and pioneer. He was born in Nainshire, Scotland; emigrated to Canada in 1805, taught school for a time in Glangarry, Upper Canada, and in 1810 went with John Jacob Astor's expedition to Oregon. About 1825, after many years' service with the Hudson's Bay Company, he settled in the Red River country, and held some offices there. He wrote *Adventures of the First Settlers on the Oregon or Columbiu River* (1849), *The Fur Hunters of the Far West* (1855), and *The Red River Settlement, Its Rise, Progress, and Present State* (1856).

ROSS, ALEXANDER MILTON (1832-97). A Canadian naturalist, born in Belleville, Ontario, December 13, 1832. He studied medicine in New York and took his degree in 1855. During the Civil War he served as a surgeon in the Federal army, and at its close served in Mexico under Juarez. He then returned to Canada and devoted himself to the study of natural history. He published: *Recollections of An Abolitionist* (1867); *Birds of Canada* (1872); *Butterflies and Moths of Canada* (1873); *Flora of Canada* (1873); *Forest Trees of Canada* (1874); *Mammals, Reptiles, and Freshwater Fishes of Canada* (1878); *Vaccination a Medical Delusion* (1885); *Medical Practices of the Future* (1887).

ROSS, EDWARD ALSWORTH (1866-). An American economist and sociologist, born in Virden, Ill. He graduated at Coe College, Cedar Rapids, in 1886, and took graduate courses at Berlin and in Johns Hopkins University. He was appointed professor of economics at Indiana University in 1891, associate professor of political economy at Cornell in 1892, and from 1893 to 1900 was professor at Leland Stanford University, first of economics and then of sociology. His resignation from this post under pressure in 1900 aroused some excited discussion of the right of academic free speech. Afterwards he was appointed professor of sociology in the University of Nebraska. His publications include: *Sinking Funds* (1892); *Hoast Dollars*, a free-silver pamphlet (1896); and *Social Control, a Survey of the Foundation of Order* (1901).

ROSS, EDWARD DENISON (1871-). An English Orientalist. He studied at University College, London, specialized in Oriental languages at the University of Paris and Strassburg, traveled in the East, and after five years in the chair of Persian at University College, in 1901 became principal of the Calcutta Madrasa. He published: *A History of the Moghuls of Central Asia*—a translation of the *Tarikh-i-Rashidi* of Mirza Haidar (1898); *The Heart of Asia* (with Skrine, 1899); and a biographical sketch of Omar Khayyam prefixed to an edition of Fitz-Gerald's version (1900).

ROSS, GEORGE (1730-79). A signer of the Declaration of Independence. He was born in New Castle, Del., studied law with an elder brother in Philadelphia, and established himself at Lancaster, Pa. In 1768 he was elected to the Pennsylvania Legislature, and was repeatedly reelected. He espoused the cause of the Indians and strove to protect them against unscrupulous whites. He was one of the seven delegates from Pennsylvania to the Continental Congress of

1774, continued a member of that body until January, 1777, and signed the Declaration of Independence. During the same period he continued to sit in the Pennsylvania Legislature, and in that capacity did much toward putting the State into a condition of defense. In April, 1779, he was commissioned Judge of the Pennsylvania Court of Admiralty, but died not long after taking office. Consult Dwight, *Life of the Signers* (New York, 1876).

ROSS, GEORGE WILLIAM (1841-). A Canadian educator and statesman, born near Nanaimo, Ont., and educated in the Toronto Normal School and in the Law School of Albert University. He was called to the bar in 1887, and at that time had long been prominent in educational affairs, and from 1872 to 1883 had been a Liberal member of the Dominion Commons, where he urged reciprocity with the United States. In 1883 he became Minister of Education for Ontario, and in 1899 was named Premier and Treasurer of the Province. He became well known as an orator and lecturer, and an agitator for temperance reform and prohibition. He wrote *Life and Times of Alexander Mackenzie*, with William Buckingham (1892), and *The Universities of Canada, Their History and Origin* (1896).

ROSS, SIR JAMES CLARK (1800-62). An English navigator and Arctic and Antarctic explorer, born in London. He entered the navy under his uncle, Sir John Ross, in 1812, accompanied him on his first expedition to discover the Northwest Passage in 1818, and participated in the voyages of Captain Parry in 1819 to 1825, and also in 1827, when Parry made the highest point north reached up to that time. He then served on the four years' expedition of his uncle in his second attempt to find the Northwest Passage. On this expedition the younger Ross made himself famous by his brilliant sledge journeys. He discovered King William Land and determined the position of the north magnetic pole off the west coast of Boothia Felix (1831). In 1834 he was made a post-captain. In 1839 he was put in command of the expedition suggested by the Royal Society and the Royal Geographical Society for the discovery of the southern magnetic pole. In 1840 his two vessels, the *Erebus* and the *Terror*, pushed through the ice pack southward of New Zealand, sailing along the 170th meridian, east longitude, and on January 11, 1841, he discovered in latitude 71° 15' S. a new land, rising in high peaks. Ross pushed in a southerly direction along the coast, landing at two islands named by him Possession Island and Franklin Island, and on January 28th came upon an active volcano more than 12,000 feet high, which he named Mount Erebus, and an extinct volcano more than 10,000 feet high, which he named Mount Terror. He then sailed to the eastward along a barrier of ice some 300 feet high, and returned to Possession Island. He named the new territory Victoria Land. It is the largest land mass yet found in the southern polar regions, and has been revisited by several other expeditions. (See Polar Research.) In the succeeding year he revisited this land and reached a latitude of 78° 10' S., which remained the lowest southern record until 1900. In the course of his first voyage he had found open water at a spot where Lieutenant Wilkes of the United States Navy, who had

preceded him in the Antarctic regions, relying upon the report of a merchant captain, had indicated land. Ross, therefore, asserted that all other reports of Wilkes concerning land discovered in the Antarctic regions were untrustworthy, and thus arose a controversy among geographers. For some years Wilkes's Land did not appear on British charts. (See WILKES, CHARLES.) Ross indicated a location of the southern magnetic pole in Victoria Land, and though his observations have proved not altogether accurate, his expedition was the best conducted and perhaps the most important of any of the early Antarctic voyages. He arrived in England in 1844 and was knighted. In 1848 he commanded an expedition to Ballin Bay in a vain quest for Sir John Franklin. He was made rear-admiral in 1856. He died at Aylesbury. He described his Antarctic discoveries in *A Narrative of a Voyage in Antarctic Regions* (1847).

ROSS, Sir JOHN (1777-1856). A British Arctic explorer and naval officer, born at Inch, Wigtownshire, Scotland. He entered the navy in 1786, and he took part in the wars with France. In 1818 he was sent to the Arctic regions west of Greenland to attempt the discovery of the supposed Northwest Passage. His vessel was the *Isabella*, and he was accompanied by Parry, in charge of the *Alexander*. He sailed along the west coast of Greenland to latitude 76° 54' N, beyond the Carey Islands, met the Cape York natives and gave them the name of Arctic Highlanders, which has ever since been applied to them. Turning south along the west side of Ballin Bay, he penetrated Lancaster Sound, which he explored for 50 miles. He erroneously concluded that it was nothing more than a deep bay and turned back, thus losing his opportunity to discover the beginnings of the Northwest Passage. In England his voyage was regarded as a failure, and it was not till 1829 that Ross, who was recognized as an able and courageous sailor, was intrusted with the command of another expedition.

He started on another quest for the Northwest Passage in command of the small paddle-wheel steamer *Victory*, the first steam vessel used in Arctic exploration. The steam power proved a failure and the useless engine was thrown away. Ross crossed Bellot Strait, thinking it was only a bay. He discovered and named Boothia Felix, the most northerly extension of the American mainland, and other very important discoveries were made, largely by sledging parties in which James C. Ross, the nephew of the commander, bore a brilliant part. In 1831 the position of the north magnetic pole was determined. Three winters were spent in the ice of this region, until failure of food supplies compelled Ross to abandon his vessel, still frozen in the pack, and make a desperate march north to Fury Beach, where caches of food supplies saved the lives of the party. They were compelled to spend the winter here in a house which they had erected, and in the following summer (1833) fell in with a whaler on which they reached home. Only three men had been lost during this long and remarkable journey. Ross was knighted, made C. B., and honored by many learned societies. In 1850 he participated in the search for Sir John Franklin, in command of the small vessel *Felix*, but returned home

after a year of fruitless endeavor. He was made rear-admiral and died in London in 1856. His published works are: *A Narrative of a Second Voyage, Including the Reports of Commander James C. Ross and the Discovery of the Northern Magnetic Pole* (London, 1835); also a treatise on steam navigation and many papers.

ROSS, JOHN (1790-1866). A chief of the Cherokee Nation and a determined champion of his people in the struggle which culminated in their removal to the West. He was born October 3, 1790, at Rossville, Georgia, not far from Chattanooga. He was of mixed blood, his father, Daniel Ross, having emigrated from Scotland before the Revolution and married a quarter-blood Cherokee woman, the daughter of John McDonald, also from Scotland. He was educated at Kingston, Tennessee, and began his public career in 1809. In the Creek War of 1813-14 he served as Adjutant of the Cherokee Regiment, which cooperated with General Jackson, and took part in the battle of Horseshoe Bend. In 1817 he was elected to the National Committee of the Cherokee Council, his first duty in that capacity being to prepare a reply to the United States commissioners, declining to negotiate for the sale of the Cherokee lands. In 1819, as president of the national committee, he was active in introducing schools, blacksmiths, and mechanics into the nation. In 1827 he presided over the convention which formulated a regular constitution for the government of the Cherokee Nation, and was elected assistant chief. In the next year, 1828, he was made principal chief and held the position until his death in 1866, which occurred at Washington. During this long period his history is the history of the Cherokee Nation.

ROSS, LUDWIG (1806-59). A German archaeologist, born at Altekoppel, Holstein. In 1832 he went to Greece, where he was appointed, by the Greek Government, superintendent of the antiquities of the Peloponnesus (1833), and in 1837-43 was professor of archaeology at the University of Athens. While in the latter post he explored the greater part of Greece, collected valuable documents, and fixed the topography of various classical localities. In 1845 he became professor of archaeology at Halle. His works include: *Reisen auf den griechischen Inseln des Aegeischen Meers* (1840-52); *Inscriptiones Graecae Inciditae* (1836); *Die Denkmäler von Attika nach Inschriften* (1846); *Das Thesäion und der Tempel des Arcs zu Athen* (1852); *Archäologische Aufsätze* (1855-61); and *Italiker und Griechen* (1858), where, in opposition to the discoveries of modern philologists, he maintained the Greek origin of the ancient inhabitants of Italy. Consult Otto Jahn, *Biographische Aufsätze* (Berlin, 1867).

ROSS, ROBERT (c.1766-1814). A British soldier. He was born at Ross Trevor, Devonshire, and after graduating at Trinity College, Dublin, entered the British army and served in Holland and Egypt. At the beginning of the War of 1812 he was selected by the Duke of Wellington to command a brigade in America. After defeating the American troops at Bladensburg, he proceeded to Washington, where he set fire to the public buildings (August, 1814). This proceeding the English justified on the ground that Amer-

jeans had burned the Canadian Government buildings at York (Toronto). General Ross was killed at North Point, Md., while marching to Baltimore on September 12, 1814.

ROSS, SIR WILLIAM CHARLES (1794-1860). An English miniature painter, born in London. After receiving instruction from his mother, Maria Ross, portrait painter, in 1808 he entered the schools of the Royal Academy. In 1814 he was made assistant to Andrew Robertson, a miniature painter. Although at first ambitious to surpass in historical compositions, in time he devoted himself entirely to miniatures, securing a lucrative practice among the fashionable circles and royalties of Europe. In 1843 he was made Royal Academician, and on June 1, 1842, was knighted by Victoria. Ross executed over 2000 miniatures on ivory. His portraits are refined, graceful, and distinctively characteristic of the individual; the color is pure and rich.

ROSS, THE MAN OF. See KYRLE, JOHN.

ROSS AND CROMARTY. A northern county of Scotland. The mainland portion is bounded on the north by Sutherland, east by the North Sea, south by Inverness, and west by the Atlantic (Map: Scotland, C 2). The greater part of the island of Lewis, with Harris, belongs to this county. Area, 3078 square miles. Ross and Cromarty in many parts presents a wild and mountainous aspect. The high grounds afford excellent pasture for sheep and cattle and the glens, in the more favored portions, are generally fertile, producing grain of a superior quality. The fisheries are important. The principal loch is Marce (Insignificant). Chief towns, Cromarty, Dingwall (the county town), Tain, and Stornoway. Population, in 1801, 56,300; in 1851, 82,700; in 1901, 76,400.

ROSSANO, rós-sá'nò. A city in the Province of Cosenza, Italy, situated on a foot-hill of the Apennines, near the Gulf of Taranto, 28 miles northeast of Cosenza (Map: Italy, L 8). It is walled, well built, and defended by a castle. The city has a beautiful cathedral, and an archiepiscopal library with a valuable manuscript of the Gospels. Alabaster and marble are quarried, and there are manufactures of silk and olive oil. Population (commune), in 1881, 17,979; in 1901, 13,553.

ROSSBACH, rös'bâc. A village in Prussian Saxony, 9 miles southwest of Merseburg. It is celebrated for the victory gained here by the Prussians under Frederick the Great over the combined French and Imperialist armies under the Prince de Soubise and the Prince of Saxe-Hildburghausen on November 5, 1757. The Prussians numbered some 22,000 men, while the forces of the allies are variously estimated at from 43,000 to 63,000. It was the intention of the allies to turn Frederick's left flank, while creating a diversion by an attack in front. Frederick, perceiving the manœuvre, shifted his left wing, consisting mainly of the cavalry under Seydlitz, so as to meet the enemy's threatened attack. The allies were thrown into utter disorder after less than a half hour's fighting, and put to flight. The Prussians lost some 500 men in killed and wounded, while the loss of the allies was more than 700 dead, 2000 wounded, and 5000 prisoners. The victory of Rossbach was important for the moral strength it brought to the Prus-

sian cause at a time when its fortunes were at the lowest. Consult Von der Goltz, *Roszbach und Jena* (Berlin, 1883).

ROSSBACH, AUGUST (1824-98). A German archeologist, born in Schmalkalden, and educated at Leipzig and Marburg. He was appointed docent in 1852, and professor in 1853 at Fulda, and in 1856 went to Breslau as professor of philology and archeology. He edited Catullus (1854; 2d ed. 1860) and Tibullus (1854) and wrote on Roman marriage, *Römische Hochzeiten und Eheverhältnisse* (1871); but it is with Greek metrics that his name is most closely connected because of cooperation with Westphal on *Metrik der griechischen Dichtkunst* and *Ueber die Metrik der griechischen Dichtkunst* (1854-65; 3d ed., as *Lehrbuch der metrischen Kunst der Hellenen*, 1885-89). His son, Otto (1858-), also an archeologist, was born in Breslau; studied there, at Jena, at Rostock, and at Berlin, where in 1884 he became assistant in the anthropological museum; was professor at Kiel from 1890 to 1895, and then was appointed to a chair of archeology in the University of Königsberg and to the post of instructor in the Academy of Art. He wrote: *De Seneca Philosophi Resensione* (1886); *Griechische Antiken des archäologischen Museums in Breslau* (1889); an edition of Florus (1896), and many contributions on mythology, art, and literature to the *Early Wissowa Realencyclopädie*. In 1900 he published a memoir of his father.

ROSSE, WILLIAM PARSONS, third Earl of (1800-67). An English astronomer, born in York. He was educated first at Trinity College, Dublin, and afterwards at Magdalen College, Oxford, where he graduated first class in mathematics in 1822. At an early age Rosse devoted much attention to the study of practical science, and especially to the problem of the best mode of constructing the speculum of the reflecting telescope. The two great defects which had baffled opticians were 'spherical aberration' and absorption of light by specula; and in the casting of these of large size there was the apparent impossibility of preventing cracking and warping of the surface on cooling. By a long series of carefully conducted experiments, Rosse succeeded in discovering a mode of operation by which the last defect was wholly obviated, and the two others greatly diminished. The metal for the speculum of his great telescope (see TELESCOPE), three tons weight, was poured into the iron mold in April, 1832, and the mold was kept in an annealing oven for 16 weeks, so that the metal should cool equally. It was then polished and mounted in his park at Parsonstown, at a cost of £30,000. The first addition to astronomical knowledge made by this telescope was the resolution of certain nebulae, which had defied Herschel's instrument, into groups of stars; next came the discovery of numerous binary and triple stars. The telescope itself is now dismantled; and experience has shown that metal reflectors cannot be made permanently useful, on account of the rapid tarnishing of the polished surfaces.

ROSSELLI, rós-sèl'li. Cosimo or Lorenzo Filippini (1439-1507). A Florentine painter of the Renaissance. He was the pupil and assistant of Nerli di Bicci (1433-56) and perhaps of Benozzo Gozzoli. At all events, he shows unmistakable traces of the latter's influence, as well as that of

Baldovimetti. Among his own pupils were Fra Bartolommeo and Piero di Cosimo. In 1480 he was called to Rome by Pope Sixtus IV. to assist in decorating the Sistine Chapel (with Bigordi, Perugino, and Signorelli). The best of the frescoes which he then executed is "The Sermon on the Mount." He painted there also "The Tables of the Law," "The Destruction of Pharaoh," "Christ Preaching from the Lake," and "The Last Supper" (1482). Among his more numerous works in Florence are "The Coronation of the Virgin" (Sta. Maria Maddalena dei Pazzi) and "The Miraculous Chalice" (Sant' Ambrogio). The latter contains among other portraits that of Pico della Mirandola. Besides others in Florence there are also examples of his art in many German galleries, and in London, Naples, Oxford, Paris, and Saint Petersburg.

ROSSELLINI, rō'zèl-lē'nà, THE. A surname applied to two early Renaissance sculptors and architects of Florence, ANTONIO and BERNARDO di MATTEO di DOMENICO GAMBARELLI (1427-c.1478 and 1409-64). They were the youngest and eldest respectively of five brothers Gambarelli, stone-cutters of Settignano, who established themselves at Florence in 1439. The appellation Rossellino properly belonged to Antonio, but was afterwards extended to his more famous elder brother, Bernardo was the pupil of Alberti and possibly of Donatello. His tomb of Leonardo Bruni (Arcimino) in Santa Croce (1444) is one of his best works in sculpture and the prototype of the fifteenth-century Florentine tombs. The tombs of Beata Villana (1451) in Santa Maria Novella and of Filippo Lazzari in San Domenico of Pistoia (with his brother) are also noteworthy pieces of sculpture. It was in architecture, however, that Bernardo made his fame. Under the popes Nicholas V. and Pius II. he was employed in many of the chief works of the day. He planned extensive changes in the Vatican and made designs for Saint Peter's which were afterwards used and changed by Bramante. The Rucellai Palace in Florence (1450), the Piccolomini palaces at Siena (finished 1498) and Pienza (1462), were also his work, as well as the cathedral, the bishop's palace, and the city hall of the last named town (1460-63), the fortifications of Cività Vecchia, Narni, Orvieto, Spoleto, and restorations of numerous churches in Rome and elsewhere.—ANTONIO was the pupil of his brother Bernardo and perhaps of Desiderio da Settignano. His work was almost exclusively in sculpture, although the Chapel of San Miniato, which contains his masterpiece, the tomb of Cardinal Jacopo di Portugallo (1461), is said to have been built by him. Other noteworthy tombs are those of the Duchess of Arno (Monte Oliveto, Naples), and of Roverella (with Barocci, San Giorgio, Ferrara, 1475). His also is the rich fountain of the Villa di Castello on the hills above Florence, near San Miniato; a figure of Saint Sebastian (1457), at Empoli, which has been called one of the most beautiful of its century; the sarcophagus of Saint Marcolinus at Forlì; and other works at Florence, Naples, and Pistoia. Consult: Geymüller-Stegmann, *Die Architektur der Renaissance in Toscana* (Florence, 1885-96); Müntz, *Les arts à la cour des papes pendant le XI. et le XVI. siècle* (Paris, 1878-98); and Vasari, *Lives*, etc., ed. Blashfield-Hopkins (New York, 1896).

ROS'SER, THOMAS LAFAYETTE (1836—). An American soldier and civil engineer, born in Campbell County, Va., and reared in Texas. He entered the United States Military Academy in 1856 and resigned in 1861, before graduating, to enter the artillery of the Confederate Army. After a year's service in this branch, he was transferred to Stuart's cavalry; and in the same year he was promoted to be brigadier-general in command of the 'Laurel Brigade.' Rosser became major-general in 1864, and in 1865 refused to surrender with Lee, but made his escape and attempted to reorganize the Confederate forces in northern Virginia. He was captured soon after, and after his release studied law. In 1871 he was appointed chief engineer of the Eastern Division of the Northern Pacific. As chief engineer of the Canadian Pacific (1881 et seq.) he built most of the line west of Winnipeg; and in 1886 retired to Virginia. During the war with Spain Rosser served as brigadier-general of United States Volunteers.

ROSSETTI, CHRISTINA GEORGINA (1830-94). An English poet, younger daughter of Gabriele Rossetti, and sister of Dante Gabriel Rossetti. She was born in London, and was educated at home under the care of her mother. After a life of devotion and retirement, she died December 29, 1894. The poetic impulse manifested itself early. She addressed a poem to her mother on the latter's birthday, April 27, 1842; sent two poems to the *Athenæum* in 1848, and contributed several beautiful lyrics to *The Germ* (1850). Her published volumes of poems comprise mainly *Verses* (privately printed, 1847); *Goblin Market, and Other Poems* (1862); *The Prince's Progress, and Other Poems* (1866); *A Pageant, and Other Poems* (1881); *Poems*, new and enlarged edition (1891); *Verses* (1893); *New Poems* (posthumous, 1896). Of much interest, too, is *Maudie: Prose and Verse* (1850; reprint, 1897). She also wrote many devotional pieces in prose, which circulated widely. As a poet Christina Rossetti ranks high; her only equal among the English women of the nineteenth century was Mrs. Browning. She is seen at her very best in her short and intense lyrics like "After Death" and "Passing and Glassing." Consult her *Poems* (Boston, 1899), and Mackenzie Bell, *Christina Rossetti, a Biographical and Critical Study* (London, 1898). Her sister, MARIA FRANCESCA (1827-76), was also a remarkable woman. She is known for her admirable *A Shadow of Dante* (1871).

ROSSETTI, DANTE GABRIEL (1828-82). A famous English poet and painter, the head of the Pre-Raphaelite Brotherhood. (See PRE-RAPHAELITES.) He was born in London, May 12, 1828, the eldest son of Gabriele Rossetti (q.v.). The literary and artistic environment in which he was brought up was stimulating to the boy's precocious powers, and at the age of six he had begun to compose dramatic scenes. After spending five years at King's College School and studying in Cary's art academy and in the Royal Academy, at twenty he became a pupil of Ford Madox Brown, whose influence had much to do with his development. With Holman Hunt, Millais, and others, Rossetti worked toward the revival of the detailed elaboration and mystical interpretation that characterized Pre-Raphaelite art. In 1860 he married Elizabeth Eleanor Siddal, whose peculiar type of beauty he has immortalized in

many of his best known pictures. She died two years later, and Rossetti never recovered from the shock. In addition to this grief he was much troubled by a bitter attack made (in 1871) upon the morality of his poems, in an article entitled "The Fleshly School of Poetry." This was written by Robert Buchanan, whose identity, veiled under the pseudonym of 'Thomas Maitland,' was not revealed until some time afterwards. The charge was vigorously rebutted by Swinburne, and by Rossetti himself under the title "The Stealthy School of Criticism." His mental depression brought on, by 1868, chronic insomnia, for which he sought to find relief in chloral. The drug obtained an unhappy mastery over him, which threw a tragical gloom upon his later years, relieved only by the creative play of his mind, which continued almost to the last to produce pictures and poems of singular beauty. He died at Birchington, April 10, 1882.

It is hard to say whether Rossetti deserves a more lasting place in the history of poetry or in that of painting. At twenty he wrote a remarkable poem, which, perhaps better than any other, illustrates the Pre-Raphaelite movement on its literary side—"The Blessed Damosel"; the combination of simplicity and concreteness with lofty spirituality, which makes it typical of the aims of the school both in literature and art, appears also in another of his early poems, "My Sister's Sleep." The great bulk of his poetry was not published until 1870. In despair at the death of his wife he placed in her coffin all his unpublished writings, and there they remained buried until at the urgent request of his friends he consented to have them exhumed. This volume, another of *Ballads and Sonnets* (1881), and a series of translations from early Italian poets, *Dante and His Circle* (1874), contain the whole of his poetical accomplishment. His only imaginative work in prose was the delicate and spiritual story, *Hand and Soul* (1850). He made several attempts in ballad form, two of which, "Sister Helen" and "The King's Tragedy," are especially remarkable; the latter illustrates his dramatic power at its highest. A special place must be accorded to his great sonnet-sequence, "The House of Life," which in its final form contains a hundred and one magnificent sonnets inspired chiefly by the love and the loss of his wife. In them the language and imagery grew much more elaborate than in his earlier work. His poetry as a whole has been called 'painter's poetry,' from its constant appeal to the eye, making it "a kind of poetical tapestry, stiff with emblazoned images." Picturesqueness and visual beauty are its most salient characteristics.

His paintings fall readily into three periods. There are, first, the small biblical pictures of which "Ecce Ancilla Domini" and the "Girlhood of Mary Virgin" are best known. Second, the Dante pictures, in which there is a brilliant imaginative Romanticism, the most important being "Giotto Painting the Portrait of Dante," "The Salutation of Beatrice on Earth and in Eden," "La Pia," "Beata Beatrix" (National Gallery, London), and "Dante's Dream" (Walker Art Gallery, Liverpool). "La Donna della Finestra" (1879) is counted among his ripest creations, but "Dante's Dream" perhaps shows the painter at his zenith. Rossetti's wife sat for many of this series. The third period was occupied almost exclusively with the 'painting of

the soul,' when he painted feminine figures furnished with poetic attributes, the deeper meanings of which he interpreted in his poems. Among these pictures the "Sphynx" alone contains several figures. "The Blessed Damosel," "Fiammetta," "The Day Dream," "A Sicilian Syriac," "A Moor's Penance," and others are separate figures dedicated to the memory of his wife. Rossetti's tall Gothic figures are motionless and silent, and are cloquent only through their spiritual hands and dreamy eyes. He drapes his figures in Venetian fashion and strews flowers about them, especially roses and hyacinths. A realistic picture, "Lionel," an illustration of the tragedy of seduction, occupies the place among his pictures which "Lanny" holds among his poems. Rossetti as a painter was not particular about details and was often awkward in line, but in color he was clearly the best of the Pre-Raphaelite group. He revels in glowing sensuous lines, and had much decorative feeling. He painted as he wrote, in a mystical, romantic spirit. Many of his pictures are scattered in English country houses, and in private collections in Florence and in America.

His collected works were published by his brother, William Michael, in 1886, and his family letters (with a memoir) in 1895, also *Pre-Raphaelite Diaries and Letters* (1900). Consult also; biographies by William Sharp (London, 1882); Knight (ib., 1887); Hall Caine, *Recollections of Dante Gabriel Rossetti* (ib., 1882); Tirabuck, *Rossetti, His Work and Influence* (ib., 1882); Wood, *Rossetti and the Pre-Raphaelite Movement* (New York, 1894); Cary, *The Rossettis* (ib., 1900); Marillier, *Rossetti* (London, 1901); essays by Sarrazin, in *Portes modernes de l'Angleterre* (Paris, 1885); Swinburne, in *Essays and Studies* (London, 1875); and Pater, in Ward's "English Poets" (ib., 1883).

ROSSETTI, GABRIEL (1783-1851). An Italian author, born at Vasto. He at first dedicated himself to painting, but renounced this career to devote himself to letters. In 1814 Murat made him Secretary of Instruction and the Fine Arts. As a member of the secret society of the Carbonari, Rossetti had a hand in the Napoleonic Revolution of 1820, and in his beautiful ode *Scipio bella* he appeared as the poet of this movement. When King Ferdinand returned to power, he had to take refuge aboard an English vessel. After a couple of years in Malta, he went to London in 1821, where in 1831 he was appointed to a post in King's College. He was a most enthusiastic student of the work of Dante, and sought to develop a fantastically absurd theory according to which Dante and the other great writers of his time wrote in a sort of conventional jargon for the purpose of diffusing Masonic doctrines. This is a teacher that actuates Rossetti's *Compendio della Letteratura Italiana* (London, 1826), and other treatises. Rossetti continued to produce verse of facile invention and intensely patriotic in expression, his *Libbia e l'Inno allettato* appeared in 1810, his *Leopoldo, il solitario* in 1816, and his *Ugo Caracciolo* in 1852. He became blind in 1845. Three of his children have been prominent in English art and letters of the nineteenth century. Dante Gabriel, Christina Georgina, and William Michael Rossetti. Consult Canducci's ed. with commentary of the *Poesie di Gabriele Rossetti*.

(Florence, 1861); the biography by Pietrocola in the *Contemporanei italiani* (Turin, 1861).

ROSSETTI, WILLIAM MICHAEL (1829—). An English critic of art and literature, brother of Dante Gabriel Rossetti. He was born in London and from King's College School entered the excise office in 1845, became assistant secretary there in 1869, and was retired in 1894. He was closely connected with the Pre-Raphaelite Brotherhood, beginning in 1848, and was editor of its organ, *The Germ*. He published a version of Dante's *Inferno* (1865) and *Fine Art* (1867), but his popular repute is as an editor of poetry and of material in regard to the Pre-Raphaelites, and as a biographer. His more important works include: *Dante G. Rossetti as Designer and Writer* (1889); *Memoir of Rossetti* (1895); *New Poems of Christina Rossetti* (1896); *Ruskin, Rossetti, Pre-Raphaelitism* (1898); *Memoirs of Gabriele Rossetti*, a translation of his father's autobiography (1901); the *Collected Works of D. G. Rossetti; Life of Keats* (1887); *Lives of Famous Poets* (1878); and editions of English poets and of *Pre-Raphaelite Diaries and Letters* (1900). His wife, a daughter of Ford Madox Brown, an author and painter herself, died in 1894.

ROSSI, RÔS'SÈ, ASARYA (or AZARIAH) DEI (c.1514-78). An Italian Hebraist, born in Mantua. In 1574-75 he published his great work *Mā'or 'Enayim*, or "The Light of the Eyes," of which the first part deals with the earthquake of Ferrara in 1570 and of natural phenomena in general. The second tells of the translation of the Septuagint, and the third deals with literary and historical criticism, for the most part in a very radical manner. Rossi answered orthodox attacks in *Ma'ref la Kosref*, or "The Refining Pot for Silver" (reprinted with the *Mā'or 'Enayim* by Zunz at Vilna, 1863-66).

ROSSI, ERNESTO (1829-96). An Italian actor. He was born at Leghorn, and studied law at the University of Pisa. Subsequently he entered a dramatic school, and after having appeared in various Italian cities, went in 1855 with Mme. Ristori to Paris. He acted there and later in Vienna with great success, and then returned to Italy and founded a dramatic company. He appeared again in Paris in 1866 in *Le Cid* on the occasion of the anniversary of Corneille. Having visited Spain, Portugal, and South America, he returned to Paris in 1875 and gave a series of Shakespearean representations. He also played successfully in London and in the United States (1881) in Shakespearean characters. Consult his *Quarant'anni di vita artistica* (Florence, 1887-89). He was the author also of *Studi drammatici* (1882) and of a few plays. His brother, CESARE ROSSI (1828-98), was a noted comedian.

ROSSI, FRANCESCO DEI (1510-63). An Italian painter, known also as Il Cecchino del Salviati and Salviati, from his patron, Cardinal Salviati. He was born in Florence, and was a pupil of Bugiardini, Bandinelli, and Andrea del Sarto (1529). Under the protection of Cardinal Salviati, he went early to Rome and painted in Santa Maria della Pace, and in the palace of his patron. In 1554 he was taken to France by Cardinal de Lorraine, and there was occupied in the Cardinal's Château de Dampierre and at Fontainebleau. His frescoes and easel pictures,

full of mannerisms imitated from Michelangelo, are in various European galleries.

ROSSI, GIOVANNI BATTISTA DE (1822-94). An Italian archaeologist, best known for his contributions to the knowledge of Christian antiquities. He was born in Rome, studied in the Collegio Romano and at the Sapienza, and then received the post of *scriptor* in the Vatican Archives, where he was long engaged in cataloguing manuscripts. The work for which he is most famous is the study of the Catacombs. Not only did he map their windings, but he made the important discovery of the Cemetery of Saint Calixtus, with its Papal tombs from the third Christian century. Rossi saw the great importance of literature in connection with epigraphy, and for the history of the Catacombs utilized martyrologies, calendars, and mediæval itineraries. In this, his great work, he was largely assisted by his brother, Michele de Rossi. Supplementing the *Roma sotterranea cristiana* (1864-77) were the *Musaici cristiani e saggi di parimenti delle chiese di Roma* (1872-96), and the *Inscriptiones Christianæ Urbis Romæ Septimo Sæculo Antiquiores* (1857-88). Apart from Christian archaeology, which was the main topic of the *Bollettino di archeologia* (1863-94, edited and almost entirely written by him), he was an able epigraphist. The Berlin Academy appointed Rossi, Mommsen, and Henzen a commission for the publication of the *Corpus Inscriptionum Latinarum* (1863 et seq.). With Henzen he edited the sixth volume of the *Corpus*, the non-Christian *Inscriptiones Urbis Romæ Latinæ* (1876-94.)

ROSSI, PELLEGRINO, Count (1787-1848). An Italian jurist and statesman, born in Carrara. He studied at Pisa and Bologna, and became professor of law at the latter university in 1812. In 1815 he sided with Murat, and upon his fall took refuge at Geneva, where he was appointed professor of criminal law (1819) and published *Le droit pénal* (1829), a very learned work, which made him famous in France. In 1833 Louis Philippe called him to Paris, and appointed him professor of political economy in the Collège de France. He there wrote his treatise *Du droit constitutionnel*, in recognition of which he was made a member of the Chamber of Peers (1839). Rossi was sent to Rome as ambassador in 1845. There he became once more an Italian subject after the fall of Louis Philippe (1848), being elected from Bologna to the Roman Chamber. On September 14, 1848, he was intrusted by Pius IX. with the formation of a Ministry. He opposed the House of Savoy and planned an alliance with the King of Naples, which had for its object an Italian confederation under the Papal presidency. The resulting unpopularity of Rossi probably led to his assassination, November 15, 1848. Besides the *Droit pénal*, Rossi published the *Cours d'économie politique* (1840) and other works. He also left many unedited writings. Consult D'Ideville, *Le comte Pellegrino Rossi: sa vie, son œuvre, sa mort, 1787-1848* (Paris, 1887).

ROSSINI, RÔ-SÈ-NÈ, GIOACHINO ANTONIO (1792-1868). A famous Italian composer, born at Pesaro. At the age of fifteen he was sent by the Comtess Pertierra to the Lyceum of Bologna. His first opera was composed in 1810 under the title of *La Cambiale di Matrimonio*, and met

with moderate success. Within the next two years he had written eight operas, all of them poor and short-lived. *Tancredi*, his first important work, was performed in 1813 at Venice, and placed its composer at once in the front rank. Next came *L'Italiana in Algeri* (1813), *Il Turco in Italia* (1814), and *Arlecchino in Palmira* (1814), each of them inferior to *Tancredi*. In 1815 he was appointed musical director of the Theatre of San Carlo at Naples. *Il barbiere di Siviglia*, one of the most successful comic operas ever written, is said to have been composed in 20 days, and was first produced in 1816 at Rome. *Otello* followed in 1817, as also did *La Cenerentola* at Rome, and, *La Gazza ladra* at Naples. Before the close of his engagement at Naples (1823) he wrote *Mosè in Egitto*, *La donna del lago*, *Motometto secondo*, and *Zelmira*. In 1823 *Semiramide* was performed in Venice, after which Rossini went to Paris, and was given the directorship of the Italian opera, one of the most coveted prizes in the musical world; but his constitutional indolence unfitted him for this position. In 1829 *Guillaume Tell* was produced, an opera considered one of his best works. In 1836 he returned to Italy, where, with the exception of a visit to Paris, he principally resided till 1855. With *Guillaume Tell*, Rossini's operatic career may be said to have closed, although his fame revived some time after, owing to his well-known *Stabat Mater*, a popular sacred work, almost secular in its musical style. Rossini was undoubtedly the greatest lyrical composer of that school of Italian opera which has found its most radical antithesis in the art of Wagner. His music is marked by stirring melody, brilliant effects, and spontaneous vivacity, and at one time had considerable vogue, although to-day only four of his forty operas are ever heard. For his biography, consult Beyle (Paris, 1892), Pongin (ib., 1870), Zanolini (Bologna, 1875), and Stittard (Leipzig, 1882).

ROSSITER, THOMAS PRICHARD (1817-74). An American portrait and historical painter, born in New Haven, Conn. He was a pupil of Nathaniel Jocelyn; in 1838-40 he painted portraits in London and Paris, and in 1841-46 he lived in Rome. Upon his return to New York City he became known as an historical painter, and in 1849 was elected a National Academician. He had a studio in Paris from 1853 to 1856, winning a gold medal at the Universal Exposition of 1855 for his "Venice in the Fifteenth Century" (1854). Among his works are: "Jews in Captivity;" "The Wise and Foolish Virgins;" "The Home of Washington" (1858), painted together with Mignot; "Washington's First Cabinet;" and a series of pictures illustrating the "Life of Christ." He was a conscientious painter, but his pictures lacked spirit and animation.

ROSS'LAND. A city in the Yale and Caribou District of British Columbia, Canada, 6 miles from the international boundary line, on railways connecting with the Canadian Pacific and with lines of the United States (Map: British Columbia, F 5). It has developed rapidly, owing to the rich mineral deposits of the vicinity. Gold is mined extensively, and silver and copper also are found. A large smelter was constructed in 1896 at Trail, 12 miles distant by rail. Rossland was incorporated in 1897. Population, in 1901, 6159.

ROSSLAU, ROS'LAU. A manufacturing town of the Duchy of Anhalt, Germany, 4 miles by rail north of Dessau, on the right bank of the Elbe. Chemicals, sealing wax, paper, machinery, wire goods, sugar, and bricks are manufactured. Population, in 1900, 10,974; nearly all Protestant.

ROSSLYN, ROS'LIN. See ROSTLIN.

ROSSMASSLER, ROS'NESER, EMIL ADOLF (1806-67). A German naturalist, born in Leipzig, where he was educated. In 1830 he became professor of natural history in the Tharandt School of Forestry, whence he was retired in 1840 because of his political and religious views. Thereafter he devoted himself for several years to popular writings on natural science, in such works as *Der Mensch im Spiegel der Natur* (1840-50), *Die Geschichte der Erde* (1856), *Das Wasser* (1858), and *Der Wald* (1863). His great work was an *Akronographie der europäischen Land- und Süsswasser Mollusken* (1835-62), with plates from his own drawings and in many cases lithographed by himself. Consult the autobiography, *Mein Leben und Streben im Verkehr mit der Natur* (edited by Russ, Hanover, 1874).

ROSTAND, ROS'TANZ, EMMOND (1818-1). A French dramatist, born in Marseilles. Early in his career he went to Paris, and produced a volume of verses of little importance, entitled *Les musardises*. His first drama, *Les romanesques* (acted 1894, published 1899), was a success in the rococo style, followed by *La princesse hantaine* (1896, published 1899), and *La Samaritaine* (1897, published 1898), "a gospel in three tableaux," as he called it, mystic and Pre-Raphaelite. All these showed a preciousness of diction and a great talent for supple and sinuous verse. They gave, however, little promise of the joyous-brilliance of *Cyrano de Bergerac* (1897), a success on two continents, and pronounced by Fauguel "the finest dramatic poem of half a century," though soberer judgment may pronounce it charming rather than strong. This was founded on the life of an actual personage. (See BERGAC, SAUVIGNEN CYRANO DEL.) Rostand's next play was historical, *L'Étoile* (1900) has for its central figure and intellectual hero the unhappy Duke of Reichstadt, "Napoleon II." It, as is asserted, Rostand's first work is *La Samaritaine*, he began his dramatic development as a disciple of Tolstoy and Maeterlinck, Rossetti and Verlaine. *Les romanesques* is more like the comedies of Musset, "brilliant stuff," as Lemaitre has called it, "sparkling with wit and glowing in places with a large and easy gaiety, frank light heartedness, and plastic grace." *La princesse hantaine* has its scene also in Utopia, here called Tripoli, and in "any period, so that the costume be pretty." The subject, the love of the troubadour prince Jautre Rudel for the fair Melisande, which had attracted Heine, Browning, and Symonds, produces a result more beautiful as a poem than *Cyrano de Bergerac*, but less dramatically effective in presentation. Besides these dramas Rostand, who calls himself "the poet of preciousity," has depicted what has been styled "a pastel of Roxane's younger sister," in *La princesse d'Émmerance*, which shows a member of the charmed circle of the Hôtel de Rambouillet (qv) occupied with the innocent artifices of a fashionable bluestocking. Rostand was elected a member of the French Academy in 1901. For a critical estimate of his work, consult: Fabre, *De Dumas à*

Rostand (Paris, 1898). The best of numerous recent articles on his work is in the *Edinburgh Review* for October, 1900.

ROSTOCK, rós'tók. A seaport and the most important city of Mecklenburg-Schwerin, Germany, situated on the estuary of the Warnow, 9 miles from its mouth, and 80 miles east-north-east of Lübeck (Map: Germany, E 1). The town retains its mediæval aspect. Of its squares, the finest is the Blücherplatz, with a bronze statue of Blücher, who was born here. The market place in the centre of the town contains the town hall, an interesting thirteenth-century Gothic structure. The twelfth-century Saint Peter's Church has a tower 433 feet high. There is a fine ducal palace. The new university building, a beautiful Renaissance edifice, was erected in 1867-70. The university library has 175,000 volumes. There is a school of navigation. The city is one of the principal Baltic ports, the exports being chiefly live stock, grain, wool, and flax. Among the manufactures are machinery, woollens, tobacco, sugar, chocolate, carriages, and chemicals. Shipbuilding is carried on. There are also an annual fair, and important wool, horse and cattle markets. Population, in 1890, 44,409; in 1900, 54,713, of whom over 95 per cent. were Protestants. Rostock was a member until 1630 of the Hanseatic League, and long ranked in importance next to Lübeck among the Baltic cities. The university was founded in 1419. Consult Koppen, *Geschichte der Stadt Rostock* (Rostock, 1887).

ROSTOPTCHIN, or **RASTOPTCHIN**, rós'top'chin, FEODOR VASILEVITCH, Count (1765-1826). A Russian general, born in the Government of Orel. He was a Court page of Catharine II., and then entered the army as lieutenant in the Imperial Guard. Paul I. made him a general on his accession to the throne in 1796, and soon after grand marshal of the Court, Minister of Foreign Affairs, and count (1799). Under Alexander I. Rostoptchin remained in banishment till May, 1812, when he was appointed Governor-General of Moscow. On the approach of the French in that year Rostoptchin by extraordinary exertions raised an army of 120,000 men fully equipped, but, to his great chagrin, was ordered to evacuate Moscow. He was held to have caused the burning of Moscow, but in 1823 he published in his own defense *La vérité sur l'incendie de Moscou* (Paris, 1823), in which he declared that this action was due in part to the fervid patriotism of a few of the inhabitants, and in part to the violence and negligence of the French. It is known, however, that Rostoptchin set fire to his own house near Moscow, and that his example was followed by many others, thus making him virtually responsible for the conflagration. In 1814 he was dismissed from office. Subsequently Rostoptchin retired to Paris, where he occupied himself with literary pursuits. In 1825 he returned to Russia. He died at Moscow. Consult: Schmitzer, *Rostoptchine et Koutousoff* (Paris, 1863); Ségur, *Vie du comte Rostoptchine* (ib., 1872).

ROSTOV, rós'táf'. One of the oldest towns of Russia, situated in the Government of Yaroslav, on Lake Nero, about 35 miles south of Yaroslav (Map: Russia, E 3). The Kremlin, which is with the exception of that of Moscow the best preserved and most interesting in Russia, is situated on a slight eminence in the centre of the town

and is surrounded by a wall one and a half miles in circumference, with numerous battlements and towers of huge dimensions. Inside the Kremlin are situated the thirteenth century Uspensky Cathedral, with relics of many saints, the *white palata* used for Court receptions by the Princes of Rostov, now containing a fine collection of Church antiquities, and the old residence or *terem* of the princes, dating from the fifteenth century. The monasteries of the town and the vicinity are also of great archaeological importance and attract many pilgrims. Commercially Rostov is of slight importance, its fair, formerly one of the largest in Russia, having greatly declined, as a result of the building of railways. The manufacture of icons or holy pictures is an important industry. The mediæval Principality of Rostov embraced, besides the present Government of Yaroslav, portions of the governments of Tver, Vologda, Novgorod, and Kostroma. It attained considerable importance and its capital was known as Rostov the Great. The invasion of the Mongols weakened it greatly and it was finally annexed to Moscow by Dmitri Donski (1363-89). Population, in 1897, 13,016.

ROSTOV-ON-THE-DON. One of the principal commercial centres of South Russia, situated at the head of the Don delta, about 40 miles from the Sea of Azov and at the convergence of three important railway lines (Map: Russia, E 5). The town contains large grain storehouses and extensive flour mills, iron works, distilleries, tobacco factories, and saw mills. The total value of its manufactures amounts to about \$10,000,000 per annum. Rostov is the centre of the grain trade of Southeastern Russia, and exports grain to the amount of about \$17,000,000 per annum. The fairs of Rostov are notable. The educational institutions include a school of navigation and a railway school. There are two libraries. Rostov dates from 1731. Population, in 1897, 119,000, including a considerable proportion of foreigners.

ROSTRA (Lat., beaks). In ancient Rome, the name applied to a great open-air platform of masonry, from which public speakers addressed the people. The ancient rostra received its name in B. C. 338, when Manius was victorious at Antium, and the beaks (*rostra*) of some of the ships captured were fastened to a platform already erected between the Comitium and the Forum. When Julius Caesar, in B. C. 44, removed the site of the Rostra to the west end of the Forum, the Græcostasis, a platform for foreign ambassadors, was removed also, and the two platforms were united, forming one continued marble-paved platform, seventy-eight feet long and eleven feet above the level of the Forum. Statues of Sulla and Pompey, two of Julius Caesar, and many others, adorned the platform. The excavations made in 1899-1900 about the so-called Rostra and Græcostasis have cast doubt upon the identification of the latter, and Boni believes that he has identified the Julian Rostra in the arcaded front of a platform of smaller size by the site previously supposed to be that of the *aurcum* (golden milestone), the larger and more prominent platform being that of Imperial rostra of successive restorations.

ROSWITHA, rós-vé'tá, **HROTSUITA**, or **HROSWITHA** (c. 935-?). A Saxon nun and poet, of noble birth. In her youth she entered

the aristocratic Benedictine cloister at Gundersheim, near Göttingen, and died there after 1601. She was well schooled in literature and theology. In imitation of Terence she wrote six plays, which show some familiarity with the classics. She also wrote historical works on the deeds of Otto I. and on the early history of Gundersheim. Her works were found and edited by Conrad Celtes, and printed at Nuremberg in 1501. The best and fullest edition is by Barack (Nuremberg, 1858); there is a school edition by P. von Winterfeld (Berlin, 1902). For other editions and works about Roswitha, consult: Potthast, *Bibliotheca Historica Medii Aevi*, vol. i. (Berlin, 1896); Köpke, *Hrotsvit von Gundersheim* (Berlin, 1869).

ROT. A common name for various plant diseases. See DISEASES OF PLANTS; FUNGI, ECONOMIC.

ROTA (Lat., wheel). A tribunal through which the Pope, in the days of his temporal sovereignty, administered justice in disputed cases relating to the temporalities of the Church throughout Christendom, and the more important civil cases of a similar nature from the Papal States. The name possibly came from the circular arrangement of the seats of the judges, or auditors as they were called. The existence of this tribunal cannot be traced back with certainty beyond the thirteenth century. Sixtus IV. in 1472 fixed the number of the auditors at twelve, and succeeding popes gave them many privileges.

ROTARY CONVERTER. See DYNAMO-ELECTRIC MACHINERY.

ROTATION. See MECHANICS.

ROTATION (Lat. *rotatio*, from *rotare*, to rotate, from *rota*, wheel; connected with Gr. *roth*, Welsh *rhod*, Lith. *rátus*, wheel, Skt. *ratha*, chariot, OHG. *rad*, Ger. *Rad*, wheel). In plants, the flowing of the protoplasm within the cell wall of certain plants and plant tissues. This may occur when there is a single large central sap-cavity (vacuole), around which the protoplasm lies, or when there are several vacuoles, in which case several currents may be observed in

A CELL FROM A HAIR OF A POPPY (*Chelidonium majus*). Showing currents in the protoplasm in the direction of the arrows.

different directions at the same time. (See Fig.) These movements seem to be related to the amoeboid movements. (See MOVEMENT.) If these are due to changes in surface tension, perhaps brought about by oxidation, rotation may be similarly explained. Nothing, however, is definitely known in this regard. Rotation may be studied readily in the young cells at the tip of Nitella or in the rhizoids of Chara, and in the hairs on the stamens of *Tradescantia* ('wandering Jew').

ROTATION OF CROPS. The practice of growing various crops from one year to another upon a given field. This practice is followed for the sake of convenience in farm work, and for the purpose of maintain-

ing and increasing the fertility of the soil. The theory of rotation is based on such considerations as the following. Plants differ much in habit of growth and in the proportion of the different elements which they draw from the soil. Deep-rooted plants have a beneficial effect on the physical condition of the soil and are capable of obtaining food and moisture from the subsoil at comparatively great depths, while shallow-rooted plants do not enter the subsoil to such an extent and are, therefore, more dependent upon the surface soil. The quantity and proportion of the crop remaining upon the soil ready to be turned under by the plow driers with the various crops. The cultivation of hood crops, such as Indian corn, tends to free the land from weeds. Leguminous plants enrich the soil in nitrogenous plant food by assimilating the free nitrogen of the atmosphere (CLOVER); and tall-growing crops take up the available nitrogen from the soil and thus prevent its leaching away by the rains of winter and spring. Furthermore, plants having a long season of growth are better adapted to soils with a small supply of available plant food than rapidly growing plants, which need an abundance of available material during their short period of vegetation. The crops consumed upon the farm tend more to maintain fertility than those which are sold; and, finally, crops differing in season, cultivation, and growth allow a convenient arrangement of the farm work throughout the year.

ROTATION OF PLANE OF POLARIZATION. See LIGHT.

ROTCH, ABBOTT LAWRENCE (1861). An American meteorologist, born in Boston. He graduated at the Massachusetts Institute of Technology in 1884, and in the next year established near Boston the Blue Hill Meteorological Observatory. There he made researches on the clouds and introduced the use of kites for weather observations. Rotch edited, in part, *The American Meteorological Journal* (1886-92), and in 1891 was appointed to the international committee on the nomenclature of clouds. His publications include the annual reports of the Blue Hill Observatory (1887 et seq.) and a popular work, *Sounding the Ocean of Air* (1900).
